In that unfortunate mine a runaway trip rushed down a rock slope 850 ft. long, pitching 30 per cent. The point of ignition was about 100 ft. from the bottom. There the cars smashed an armored cable, causing an inside contact which blew through the armored covering. This not only produced the spark which ignited the dust in the slope, but stopped the main fan for about twelve minutes until auxiliary power for the fan could be hooked up.

Men with Open Lights Ignite Gas in Shaft Abandoned and About to Be Reopened

An explosion of a pocket of gas at the base of a 200-ft. shaft at the Marcoll mine of the Maher Collieries Co., near Clarington, Monroe County, Ohio, Aug. 2, was responsible for the fatal burning of two men and for the serious burning of others of a party of six men who descended the shaft which was being reopened. The shaft was sunk two years ago and had never been used. At the bottom, entries had been driven about 30 ft. in two opposing directions. The shaft had been allowed to fill with water awaiting the time when the mine would be completed and the hoist installed. There is not as yet any connection between the main shaft and the mine. Mining has been conducted in the property, but up to the present coal has been hoisted through the air shaft except that taken from the 60 ft. of entry just mentioned.

Recently the company decided to install a hoist in the main shaft. On the day of the explosion, Thursday, Aug. 2, the water had been lowered to within 2 ft. of the bottom, and the pumps were still working, endeavoring to lower the water still further. Men had gone down the shaft frequently but had detected no gas. Even as recently as 12 o'clock noon on Thursday three men had been inspecting the pumps at the bottom of the shaft. They carried open-flame lamps and stayed down a half hour or so without any mishap.

At 1:30 p.m. a party of six descended the shaft steps. In the group were William Maher, general manager of the mine; James F. McCurdy, a salesman for the Gee Electric Co., of Wheeling, W. Va., both of whom are now dead; Daniel Maher, a brother of the manager and in charge of the Rosemary mine nearby and L. F. Read, engineer for Allen & Garcia Co., of Chicago, Ill., both of whom are seriously burned but will recover, Harry W. Gee and David H. Parker, both of Wheeling.

Before the unfortunate six started down the stairs, William Maher borrowed two carbide lamps at the surface, and Read carried his own, making three open-flame lamps in the party. It is probable that William Maher was first to arrive at the bottom with McCurdy and Read close behind. They no sooner had reached the bottom than the gas ignited and sent a burst of flame up the shaft which mounted 10 or 15 ft. into the air

above it. The men on the surface gathered round the opening and were rejoiced to see five of the six men make their way alone and unaided up the stairs to the top. Will Maher and Read appeared first and were led down the short stairs from the top of the shaft collar to the ground. The others came up later, but Parker failed to make his appearance. Miners rushed down the stairs and found him lying at the bottom. They got several lungfuls of carbon monoxide helping him out. Though unconscious he needed little aid to bring him round. A doctor from Clarington and a trained nurse reached the mine soon after and treated the burned men before they started to Wheeling by train from Woodlands, a station across the Ohio River from the mine. At first it was hoped that all would recover.

An engineer who was at the mine two days after the accident said that in his opinion the explosion was a deplorably unfortunate occurrence with no blame to be attached to anyone. He said: "It is easy now to say that the shaft should have been ventilated and safety lamps used but who would ever have perceived that necessity before the explosion happened."

Bulletin Board with News Photographs, Personal Message and Welfare Cartoons

WITH increased interest in safety, the bulletin board has become an important factor in most mines. Some have wished that, besides carrying the safety message, it might have a story of a somewhat different character that, being changed with frequency, would draw the men to a more frequent perusal of its contents. To this end the Elliott Service Co., 244 West 49th Street, New York, has introduced an industrial service which includes the placing of a three-section glass-enclosed green-enameled steel-framed bulletin board at the mines, displaying 14x17-in. news photographs which are changed every day. These news photographs occupy the central panel of the bulletin board

and on the left side is placed an inspirational paragraph on safety, health, education and like subjects delivered by a man of national fame and made personal by the use of his photograph. On the right are placed several safety bulletins and also perhaps some objects of local interest in connection with safety. Here may be displayed a piece of a shirt or overalls that have been torn off by some machine, carelessly left unguarded, or goggles which have served to protect the eyes of a workman from a flying piece of steel.

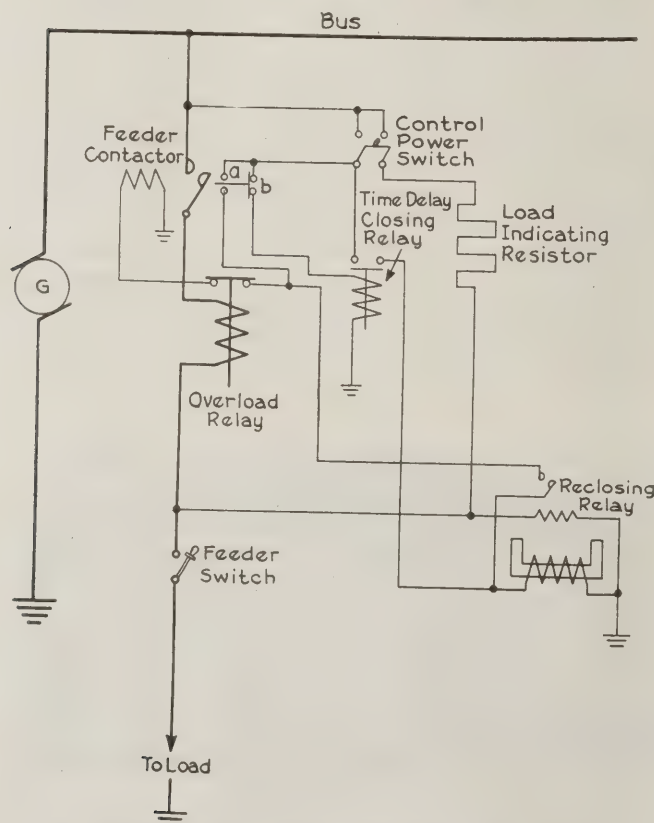

This service also provides a printed sheet "Introducing Jim Kelly." That worthy gives utterance to a number of wholesome and plain truths in a pleasant and inspiring manner. The board measures 32x64 in.

New Equipment

D.-C. Automatic Reclosing Equipment

AUTOMATIC reclosing equipments have recently come into use in mine installations for use on circuits supplying power to hoists, cutting and drilling machines, mine trolley systems, etc., in industrial plants, and on street railways. The reclosing feature insures continuity of power at the load under normal conditions and at the same time is a reliable protection to the main-line apparatus in case of a disturbance on the feeder. The automatic character of the reclosing apparatus eliminates delays that might arise from the necessity of reconnecting the load manually.

An automatic reclosing equipment of such a character for use on direct-current circuits of 300 and 600 volts was recently developed by the General Electric Co. Its function is to protect apparatus in case of short-circuits or heavy overloads occurring on the feeders, while in-

AUTOMATIC RECLOSING BREAKER EQUIPMENT

Continuity of service has become an important factor in coal mining. This breaker restores service to a line immediately the line is cleared of the cause of the interruption. Furthermore, no attempt is made to reclose when a high load remains on the line; this prevents serious peak loads being thrown on the machine at closing.

insuring continuity of service when the trouble is only temporary. It is designed for use on circuits employing stub-end feed, a combination of stub-end and multiple feed, or in combination with a sectionalizing switch, or sectionalized feeder.

The operation on stub-end feed, where there is only one source of power to the load, is typical, and its description will serve to give an idea of how the appara-

tus functions. The devices that go to make up the equipment are a shunt contactor, an instantaneous overload relay, a reclosing relay, a control power switch and a load-indicating resistor. These devices are connected in accordance with the wiring diagram.

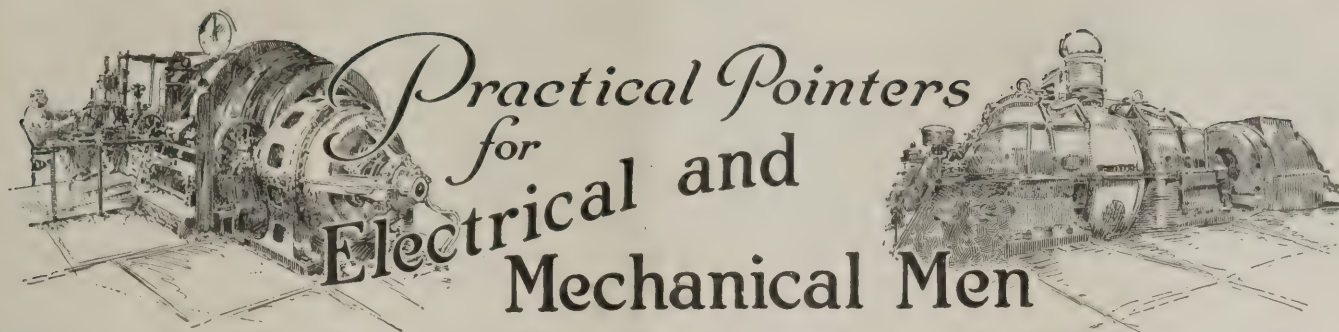

The sequence of the operation of the equipment in case of short-circuit or heavy overloads on the feeder is as follows: The overload relay opens its contacts, de-energizing the coil of the contactor, which opens, disconnecting the load from the source instantaneously. When the contactor opens it closes auxiliary switch (b) which energizes the coil of the time-delay circuit closing relay, which starts to close. The time delay is inserted at this point in the sequence of operation in order to allow conditions on the feeder to become stable. The closing of this relay completes the circuit through the lower coil of the reclosing relay.

The reclosing relay has two coils, and to operate must have both of them energized. Its operation somewhat resembles that of a voltmeter, the lower coil being analogous to the permanent magnet of the meter, and the upper furnishing excitation to the movable element on which the contacts are mounted. The relay contacts will close only when the drop in voltage across the load, with which the upper coil is in parallel, becomes enough to cause that coil to excite the movable element sufficiently to close them. When the load resistance is zero, as in case of a short-circuit, there is no voltage across the upper coil, but when the load resistance is infinity, or open-circuit conditions exist, there is practically full voltage across the upper coil, because its resistance is so much greater than that of the load-indicating resistor. Therefore it is possible to obtain an intermediate point, and calibrate the reclosing relay so that with a definite value of resistance in the load-indicating resistor the equipment will not close on a load in excess of a predetermined value.

As long as the trouble on the feeder continues the reclosing relay will remain open, even after the time-delay relay has closed, because the voltage across the load is not enough to close the contacts. As soon as the trouble has cleared and the load resistance has passed the predetermined point, the relay will close, energizing the coil of the feeder contactor, which closes, causing the closing of the auxiliary switch (a), which seals it in. The closing of the contactor reconnects the load and de-energizes the time delay relay, which opens its contacts.

The equipment for circuits having a combination of stub-end multiple feed makes use of a contact-making voltmeter to indicate when the potential difference between the feeder and the source has fallen to a safe reclosing value. When the voltage has so fallen, the feeder contactor recloses in the same sequence as in the former case. A relay connected in parallel with the contact-making voltmeter determines whether the equipment is to operate on multiple or stub-end feed.

EXCELSIOR—BALES OF IT—is now being used by anthracite shippers to make tight the bottoms of coal cars, particularly for the shipment of fine sizes. It is readily stuffed into cracks and holes and makes a better filling than hay, straw, stones, old iron or planks. It has the further advantage that if it becomes mixed with the coal when unloaded no damage is done to conveying machinery or stokers. It can be had at a little over 1c. per pound. Some companies are reported to be using it by the carload.

Electric Braking on Mine Locomotives

I WAS greatly interested in the article entitled "Theory and Operation of Electric Braking" which appeared in the July 5th issue of *Coal Age*, and am therefore prompted to use your columns to give some interesting experiences along this line which I had some few years ago.

Believing in the possibilities of electric braking for mine locomotives, I made some experiments on a Goodman 4-ton locomotive which was driven by a single motor. I took the locomotive to the top of a grade, hooked down the trolley pole, grounded the trolley cable to the frame of the locomotive, reversed the controller and released the brake. I was greatly pleased with the manner in which I could control the speed of the locomotive while going down the grade. By operating the controller handle the braking effect could be varied over a wide range. Later I tried out the scheme with a loaded trip and had the same results.

When it came to trying out this idea with a locomotive with two motors the results were different. The two motors or generators, as they should properly be called under these conditions, would not build up together, in parallel. The first generator to "pick up" would force a current through the other dynamo and tend to drive it as a motor in a direction opposite to that which the locomotive would be moving at the time; the result was a very quick dead stop. To overcome this difficulty I arranged a connection in the controller as shown in Fig. 1 which in effect established an equalizer connection between the two dynamos while operating as generators in parallel. This arrangement seems to have no particular objectionable features and is quite simple and shown in Fig. 2. With this connection, when the fields are in parallel, no matter which armature would start generating first, both fields would become excited and the same amount of current would flow through each field, thus both generators would build up and generate a current which would flow through the external circuit, through the resistance and controller where it could easily be varied.

With the courtesy of our general superintendent I was permitted to give this scheme a thorough tryout. At our No. 4 mine there is an outside haulage or tramway a mile and a quarter long between the mine and the tippie which has an even heavy grade. It is the usual custom of haulage to have brakes set on most of the loaded mine cars when dropping the trip down this grade and to use the hand brake on the locomotive or power from the trolley line when necessary to control the speed. A 10-ton locomotive ordinarily will not control more than twelve loaded cars on this grade with the locomotive hand brake alone and no brakes set on the cars. I equipped a Westinghouse Type 58, 10-ton

locomotive with a heavy single-pole double throw switch on the trolley cable with the one position grounding the cable to the frame and used the equalizer connection. It was a very simple matter to handle a trip of fifteen loaded cars without the use of any mechanical braking, being able to check from maximum ordinary speed to a dead stop in a length of fifty feet, of course using the hand brake after the final stage of the electric braking was reached. I feel positive that a trip of twenty-five cars could easily be handled in this same manner, although we have never tried so many without some of the car brakes set.

The controller was the ordinary series and parallel type. The equalizer connection was permanently established by brazing a copper jumper between two segments of the reverse cylinder on the parallel position. The series position can also be used independently. This jumper on the parallel position does not interfere with the hauling in the opposite direction (up grade) in fact, this equalizer seems to be a great aid in hauling in parallel, as explained below.

Ordinarily it happens that, during a heavy haul when sand is used on the rails one truck will start spinning, which requires shutting off the controller and starting up again. It is easily understood why a series wound motor will race when it loses its load and, when the wheels start spinning the friction decreases and the speed increases, due to the weakened field under a lighter load. But, with the use of the equalizer, both fields are always excited the same amount and the tendency for one truck to race when the other is down to a heavy haul is greatly lessened. This, of course, prevents a considerable amount of the lost friction and increases traction. So, why not use the equalizer in hauling as well as in braking?

I can find only one disadvantage in having the equalizer connection permanently established. This is in case of damage or injury to either an armature or field of either motor. Ordinarily, when one motor fails, it can be cut out of the circuit easily and the locomotive can then "limp" in for repair on the other motor. But, with a permanent equalizer either the armature or the field or both on the damaged motor must be disconnected before the locomotive can be moved on its own power to the repair shop or motor pit.

FIG. 1—CONTROLLER WITH EQUALIZER-CONNECTION

The dotted lines show where the equalizer was tapped in. Note that it is necessary to put an equalizer on the forward and reverse parallel positions.

I am offering this method on account of its simplicity. Its use will make possible electric braking on any locomotive without changing the type of controller. If the double-throw switch could be mounted so that it could not be thrown without shutting off the controller it should be done, as throwing the switch while the locomotive is using power will cause a heavy arc with disastrous results.

E. L. HOLSOPPLE.

Electrical Department, Knickerbocker Mines,
Hooversville, Pa.

Where the single motor drive is used, Mr. Holsopple has met all the requirements for electric braking by simply grounding the trolley cable and reversing the controller so that it is operated the same way as it would be if climbing a grade with the assistance of the power system in that direction instead of descending a grade. That is, the direction of rotation is the same as motoring down grade but the field has been reversed thus making the motors function as generators.

In the case of two motors acting as generators in parallel and with an equalizer circuit between them, there are some disadvantages which must be considered. With any two motors there is a variation in the magnetic circuit and in the resistance of the windings due to manufacturing limitations. With the equalizer connection the current will divide between the fields in proportion to the resistances of the field windings.

FIG. 2—SIMPLIFIED EQUALIZER DIAGRAM

This sketch shows how the current generated in either armature may divide and excite both fields.

Even when these resistances are approximately equal the ampere-turns for setting up the magnetic flux of the poles will be approximately equal only when the turns of wire in the field coils are equal. Furthermore the flux set up by equal ampere-turns is a function of the magnetic circuit which is variable in all motors. Therefore unless the flux is exactly equal there will be a circulating current between the armatures through the equalizer which will tend to overload one of the motors. This condition exists both when motoring or generating. Care should therefore be taken whenever an equalizer circuit is used instead of transposing the fields, as the overloading of one of the motors may become serious.

Other causes for unbalancing may occur. One such cause may be the difference in diameters of the driving wheels connected to each motor. When the motors are operating as generators, the generator connected to the set of wheels having the greater diameter would run a little slower than the other set and since the fields are balanced by the equalizer between them, the slower generator would generate a lower voltage than the other. The amount of unbalancing therefore would vary with the difference in wheel diameters.

Most locomotive motors could ordinarily stand the slight unbalancing which might occur under general conditions. However these are factors which must be considered so as to be on the safe side.

How Best to Undercut Commutators Of Direct-Current Armatures

THE object of undercutting commutators is to clean out the mica between the copper segments from the face of the commutator to a depth of $\frac{3}{8}$ in. This gives a smooth, even surface, which is not always possible when the mica is not undercut. Hard mica will not always wear down with the copper bars and thus leaves ridges on the commutator surface. The completed armature, after being rewound, soldered and banded, has the commutator trued up and all excess solder removed from the neck and face, and is then turned over to the undercutter. If undercutting were done before soldering, the excess solder might fill up the grooves and short-circuit the commutator bars.

The most efficient machines for doing this work are special lathes with either motor-driven or belt-driven circular saws clamped on an arbor which is mounted on a head that moves on slide rails. By means of a hand-operated lever or a foot pedal controlled by the operator the revolving saw is carried over the face of the commutator. The head carrying the arbor is fitted with an adjusting screw to adapt the height of the saw to commutators of different diameter. An air hose and hood sometimes are provided to carry off the mica dust. A less expensive equipment to do this work consists of an air- or power-driven (through a flexible shaft) circular saw, which is guided over the commutator face by hand. A handsaw consisting of a piece of hacksaw blade mounted in a holder for doing this work, also a small cutter to clean the slots of small particles of mica left by the circular saws often are used.

The armature is mounted between the centers of the special lathe, or on two horses if the hand-guided saws are used, so that it can be rotated readily. The small circular saws are revolved at approximately 2,000 r.p.m. and are drawn toward the operator, so that he can guide the cut. The cutting edge of the saw should revolve in a direction toward the operator while it is cutting the mica.

After slotting is completed, the face of the commutator should be thoroughly polished and cleaned of all particles of copper by means of emery cloth. The special lathe can be so equipped that this polishing is done without removing the armature from the lathe centers.

It is essential that all particles of mica be removed from between segments by this operation; thus it is advisable to use a saw about 0.005 in. larger than the thickness of the mica to be undercut. A small diameter saw must be used in order to cut the slot to the proper depth and at the same time not cut into the neck of the commutator. After the slots are sawed it sometimes is necessary to go over them with a small hand cutter, to remove all remaining particles of mica.

A clean undercut commutator prevents high mica, which reduces the burning of the commutator bars, increases the life of the carbon, and practically eliminates flashing. This results in greatly reduced maintenance cost.

An undercut commutator should operate from one heavy inspection period to another. If an armature is removed from the motor frame for any other repairs, however, the commutator should be carefully inspected, and if the mica is getting flush with the copper the commutator should be carefully trued up and then undercut and smoothed.

Problems of Operating Men

Facts Throwing New Light on the Wakesiah Explosion

Pumpman Killed by Coal Blown from Cars on Main Slope—Jack Hammer Drills Made Much Fine Dust—Air Laden with Gas and Dust Ignited on Lamp

I HAVE read with interest the letter of "Mining Engineer, No. 2," *Coal Age*, June 7, p. 940, relating to the Wakesiah mine explosion of Nov. 24, 1922, and asking for more detailed information in regard to the exact position of the pumpman who was killed by the blast, and the location of the motor driving the pump.

In answer to the first question, kindly permit me to say that the pumpman was found, after the explosion, lying on the main slope directly opposite and about eight feet from the pump. The pump was driven by compressed air. There was no electric motor, as the second question would seem to imply.

COAL BLOWN FROM CARS KILLS PUMPMAN

Standing on the main slope, about fifty feet below the pump where the pumpman was picked up, there was a trip of six loaded cars. Such was the force of the explosion that this was moved up the slope twenty feet, as shown by the amount of slack rope.

The pumpman was killed instantly by the flying coal that was blown from the top of the cars and scattered a long distance up the slope. My duties following the disaster were such as to enable me to see the actual conditions that existed in the mine and I am therefore speaking from personal knowledge and observation.

First, in respect to the lamps, as has already been stated by other writers, the men were all equipped with electric cap lamps, except the fireboss who carried the only flame safety lamp used in the mine.

TESTS SHOW LAMP WAS IN GOOD CONDITION

From my own knowledge, I can say that the lamp had been subjected to test in a highly explosive mixture and found to be in good shape after the accident, although the gauze showed signs of intense heat.

It is my firm belief that the point of ignition of the gas was at the place where the fireboss' lamp was found. Careful study of the situation and observation of the facts leaves no doubt whatever in my mind but that the gas ignited on this lamp. Whether or not the lamp was properly handled is another question and one that I will not assume to discuss further than to say a safety lamp ceases to be safe when improperly used.

The evidence obtainable on the fateful morning of the explosion, in respect to the point of ignition was very marked. There were the burnt cap and the blistered bag of the fireboss, showing plainly the immediate presence of flame. There were, besides, numerous signs of force emanating from that vicinity.

It is true the fireboss was not killed by the blast, but was overcome by the afterdamp when he had fled 100 ft. from where he dropped his lamp. It must be remembered that his position in the *cul de sac* protected him from the full force of the blast, which gained strength as it swept up the slope 250 ft. to where it felled the unfortunate pumpman.

JACK HAMMER DRILLS MAKE MUCH FINE DUST

One factor that I believe has not been mentioned in connection with this disaster is the presence on the walls, floor and timbers of much finely powdered coal dust. In this section the miners largely drilled their holes with a jack hammer drilling machine. Anyone familiar with this tool knows the quantity and extreme fineness of the dust produced.

Consider then what would be the result of starting to blow out from its lodgment a body of gas by the use of a blast of air under a pressure of 90 lb. per sq.in. When the fireboss turned on the air undoubtedly this fine dust was thrown into suspension in the air and formed a most dangerous atmosphere with the gas dislodged from the roof. It is pleasing to know that the Coal Mines Regulation Act has now been amended and forbids the use of these machines without some means being employed to prevent the suspension of the fine dust in the mine air. The act also forbids the use of compressed air for blowing out gas from where it is lodged in a mine.

PROBABLE MOVEMENTS OF THE FIREBOSS

Observing the position of the nozzle of the air hose, I noticed it was directed upward in a slanting direction in a manner that would force the gas down on the lamp, which was 21 ft. away from the nozzle. The nozzle I would say was about 4 ft. inside of the gas, leaving only 17 ft. from the gas to the lamp.

Presumably, after adjusting the position of the nozzle, the fireboss had gone down and turned on the air at the valve, 30 ft. below, and then walked back up the road to wait till the place was clear, so that he could so report, this being the last place on his round and the time being about up for making his examination of the mine.

Considering the velocity of the blast from the air hose and the fact that the fireboss was advancing up the slant against the air highly charged with gas and fine dust, one has no difficulty to imagine what happened.

In conclusion, allow me to remark that it behooves every man when using a safety lamp, for any purpose in a mine, to handle the lamp with the utmost of care and not to violate the principles on which it was designed. We are all of us too prone to omit many precautions that make the use of the lamp safe. The price of safety is eternal vigilance.

Nanaimo, B. C.

S. K. MOTTISHAW.

Moving a Body of Gas Dangerous Work

Use of compressed air in moving gas a dangerous practice that should be stopped—Move a large body of gas a little at a time—Give air current time to dilute gas—Watch lamps closely.

HAVING moved much gas in mines, I have been deeply interested in what has been written regarding the fatal Wakesiah explosion caused by a fireboss' attempt to blow out an accumulated body of gas with compressed air.

The letter of Glen Calder, which appeared in *Coal Age*, April 5, p. 568, particularly impressed me and I quite agree with him that the practice of removing gas, from a place where it has lodged in a mine, by the use of compressed air is extremely hazardous and should be stopped.

Anyone who undertakes to move a body of gas should remember that he is about to deal with a dangerous proposition. He should exercise every precaution, run no chances and take nothing for granted. First, study the situation carefully before taking any steps to disturb the gas.

SAFEST PLAN IN MOVING LARGE BODY OF GAS

When moving gas the safest plan is to first withdraw all men from the mine, unless one can feel that there is absolutely no danger to those remaining at work. The fireboss or man in charge should always take with him an experienced helper.

He should test carefully and know, as nearly as possible, about the volume of gas he must handle. This will make it possible for him to gage properly his air current, which must be strong enough to act efficiently on the body of gas and effect its removal.

It is of most importance to move a large body of gas a little at a time, which will give the air current time to dilute the gas and render it harmless as it passes out of the mine. In this manner there is no danger to be feared from the return current becoming highly explosive.

It is my experience that a person cannot be too careful in the handling of gas. A very slight mistake may mean the loss of one or more lives. Far better is it to lay the mine idle than to take any chance of accident that may prove fatal or destroy valuable property.

By directing a large air current against a considerable body of gas, it may be caused to descend onto the lamps, which must be closely watched and removed from the place on the first appearance of danger.

Loogootee, Ind.

JACOB RILEY.

Bituminous Mine Law (Pa.) on Ventilation

Insufficient ventilation of mine chief cause of explosions—Bituminous law not lacking in this respect—Strict compliance with what the law requires needed to avert disaster.

SINCE reading the good letter of C. W. Atkins, *Coal Age*, March 1, p. 378, naming different conditions in mines that invite explosions, it has been on my mind to offer a few comments bearing on the requirements of the mine law with respect to ventilation.

While I heartily agree with Mr. Atkins that an "insufficiency of ventilation" is a chief cause of many mine explosions, I fear he has overlooked certain references in the law when he says, "The volume of air in

circulation may be sufficient to comply with the requirements of the mining law and yet not enough to dilute and sweep away the gases generated in the workings of a mine."

As I understand the Bituminous Mine Law of our state it requires the ventilating current in a mine to be sufficient to "dilute, carry off and render harmless the smoke and the noxious and dangerous gases generated therein." If this is not done the circulation has not complied with the law's requirements.

LAW PROVIDES FOR EVERY POSSIBLE CONDITION

Perhaps, the statement first quoted above has reference to the specific requirement (Art. 9, Sec. 1) of "not less than 200 cu.ft. per min." for mines generating gas. But the law adds "and as much more . . . as one or more of the inspectors may deem requisite." This clause should certainly be broad enough to fully meet any and every condition that can reasonably be expected to arise in a mine.

What could be more full and explicit in respect to the ventilation of mine workings than the following paragraph of the same section of the law:

The ventilation shall be conducted through the main entries, cross entries and to the working faces of all working places in the mine in sufficient quantities to dilute, carry off, and render harmless the smoke and the noxious and dangerous gases generated therein, to such an extent that all working places and traveling roads shall be in a safe and healthy condition for the persons working and traveling therein.

The number of explosions that have occurred recently should incite every miner to use his utmost efforts to prevent their recurrence. We are led to wonder if the next disaster will come closer home. Are we, one and all, doing what lies in our power to avert these terrible calamities and make them history of the past?

It is my belief that if every official of a gaseous mine would insist on a strict compliance with every requirement of our state laws and take no chances there would be a large reduction in mine fatalities. This discussion in *Coal Age* should nerve every man to action.

JAMES THOMPSON.

Mayport, Pa.

Permissible Explosives vs. Black Powder

More enlightenment needed regarding use of permissible powders—Use of black powder not justifiable—Why permissibles often fail—Firing by electricity safest and most efficient method.

FOR some time past I have been watching and waiting for the question of the use of permissible explosives to be brought to the attention of *Coal Age* readers. It would seem that greater efforts should be made to enlighten mining men, both operators and miners on this important subject.

If this was done more persistently and systematically there is no doubt in my mind but that this class of explosives would come into more extensive use in coal mines than is true today.

CONTINUED USE OF BLACK POWDER UNREASONABLE

In the larger development of mines and the rapidly increasing production of coal, it is evident that the continued use of black powder for blasting down the coal is going to be a chief factor in maintaining a high accident rate in this country.

From the standpoint of safety and efficiency in mining, the use of black blasting powder in coal mining

cannot be justified. Arguments in its favor, however plausible, are without the sphere of reason. It is true that, owing to its slower action, larger coal is produced and a less proportion of fines and dust are the result.

On the other hand, the larger amount of flame projected into the mine air when a shot is fired must always be a menace to life and property, which no responsible operator or miner can ignore. This fact alone is enough to debar absolutely the use of black powder in any coal mine.

OPPOSITION TO USE OF PERMISSIBLE POWDER

It has always seemed strange to me that there should be so much of opposition manifested, on the part of many operators and miners, when an attempt is made to introduce permissible powder into a district or even a single mine. The danger in the use of black powder is well known and yet many prefer to take the chance because of the promise of producing larger coal.

It has been my lot to have worked, at different times, in mines where either of these explosives have been in use. I could not fail to observe what varying results were obtained, because of lack of care and judgment in choice of suitable grade of powder or proper weight of charge in shooting different coals.

When making my daily examination, in a mine using permissible powder, I would often notice what little work the powder had accomplished, in respect to the extent of face blasted in those places. The coal would generally be seriously pulverized and much dust produced, making the mine dangerous.

In other places, where the explosive was better suited to the coal in question, a good grade of marketable coal was invariably produced and there was not the same difficulty experienced in squaring up the face, which requires much extra labor on the part of the miner when this has to be done because the coal does not shoot right.

WHY PERMISSIBLES GAVE POOR RESULTS

My observations led me to conclude that, in most instances, the pulverizing of the coal and the need of extra work to square up the face was owing to excessive charges of powder or poor judgment of the miner in placing his shots. These results, however, whatever their cause and whatever the conditions of their occurrence, have naturally made working men regard permissibles with disfavor.

My opinion is that electric firing is not only far safer practice but is a more efficient method and gives better results in the use of permissible powders. The simultaneous firing of a number of shots in a place eliminates the danger of a miner returning too quickly to the face, which is often the case in firing single shots. There is also a saving in explosive for the same work performed.

Finally, permissible explosives are made up in cart-ridges of less diameter, requiring smaller holes and a lesser number of them for the same tonnage of coal mined. It is also easier to tamp a small hole than a large one. The drills are lighter, more easily handled and cost less than the drills used previously. In fact, a miner will often find that a common breast auger is all that is needed when using permissible powder in blasting his coal. The size of the hole is the important factor. Labor should appreciate the fact that it is far easier to drill a 1½-in. hole than a hole 3 in. in diameter.

Inquiries Of General Interest

Flooding Prevents Operation of Slope Mine

Mine Underlies Creek Bottom—Water Drowns Out Workings During Rainy Season—Lining Slope with Concrete Fails to Keep Water Out—Steel Door Proposed

WE ARE having much trouble of a very serious nature in endeavoring to keep water from drowning out the workings in our mine. The water comes from the surface drainage and at times of the heavy spring rains the inflow is so great as to threaten the life of the mine.

Our mine is opened by a slope that was started in a bed of quicksand 30 ft. deep and driven on an inclination or dip of 11½ deg. After being drowned out at two different times in a single year, I decided to concrete the mouth of the slope, starting from the entrance and continuing for a distance of 300 ft. to where the slope reached the coal.

This plan seemed to me full of promise of making the mine comparatively dry. The work was well done, the top and both ribs of the slope being covered with a layer of concrete 18 in. in thickness, at a cost of \$9,000 when the work was completed. Much to our disappointment and discomfiture, the result was a failure as the concrete lining did not prevent the water from finding its way into the mine and the next heavy rain again filled the mine and we were obliged to cease work. The water appeared to seep down behind the concrete ribs and come up through the floor of the slope. I should have stated that this mine underlies a creek bottom.

I propose now to build a steel door at the end of the concrete lining, at the foot of the slope. The coal here is five feet in thickness. The door is to be made water-tight and I want to ask the opinions of *Coal Age* and its practical readers if they think this door will keep the water from flooding the mine in time of freshet.

Hartshorn, Okla.

JOSEPH MAGDALENA.

Here is a proposition that should call forth many practical and helpful suggestions. The seasonal flooding of such mines is not uncommon in the practice of coal mining and the experiences of others in like situations will be of untold interest.

There is little doubt but that a heavy steel door could be built at the foot of the slope capable of sustaining the pressure that would be thrown on it in the event of the slope filling with water during a wet season. The question is, however, Could the structure be made water-tight and the water kept out of the mine, which is the object sought, till the danger is past and the water can be pumped or bailed from the slope by water cars.

Assuming an opening 6x10 ft. in section the total maximum pressure at the foot of the slope would be, $62.5 (6 \times 10 \times 300 \times 0.19937) \div 2,000 = 112\frac{1}{2}$ tons which is not excessive. The problem then would be to make the floor and surrounding strata impervious to water. Let us hear from our practical readers.

Examination Questions Answered

Penna. Bituminous Examinations, Foremen and Firebosses

(Selected Questions)

QUESTION—(a) *What are the principal causes of accidents in coal mines?* (b) *What precautions would you take to reduce such accidents to a minimum?*

ANSWER—(a) In the order named the most frequent causes of accidents in the mining of coal are the following: Falls of roof and coal; movement of cars and locomotives; gas and dust; electrical equipment of all kinds; use of explosives; shafts and steep slopes.

(b) Supervise carefully and closely all work at the face; enforce strictly all rules and regulations regarding timbering, blasting and haulage; instruct workmen in safe practices; install and maintain needed safety appliances; attend carefully to the efficient ventilation of all working places, roads and travelingways; and finally operate the mine in full compliance with law.

QUESTION—*Describe in detail how room pillars should be drawn with mining machines, to secure the greatest recovery of coal, with the highest degree of safety to the workmen and the greatest economy in the use of posts and other material.*

ANSWER—In drawing room pillars with machines, the main point is to develop the mine with the room pillars of such size that they will suffer no crushing effect in the first working. In machine work where roof conditions will permit, advantage is gained by driving double rooms with a 50- or 60-ft. breast for working the machine. In any case, however, when drawing the pillars the cut must be started on the side of the pillar farthest from the gob, in order to afford better protection for the men and the machine. In driving single rooms with track laid along the straight rib, this will

necessitate widening the rooms in the direction the work is advancing, in order to facilitate loading the coal on the track and keeping the machine on the side of the pillar away from the gob. The accompanying figure shows advancing room-and-pillar work where the rooms are widened inby and the track is then laid on the inby side of the straight rib.

QUESTION—*Assuming that you were in charge of a non-gaseous mine worked with open lights and explosive gas is discovered on certain pillar falls, what precautions would you take to safeguard the workmen; (a) before removing the gas; (b) while removing the gas; (c) after the gas has been removed?*

ANSWER—(a) Send reliable men to notify all workers in that district or section to extinguish their lights and conduct them by the safest route to the shaft or slope bottom or mine entrance. Also, station reliable men to guard all approaches to the affected district and the return air-course.

(b) Select competent helpers and equip them with good safety lamps. As far as practicable, increase the circulation of air in the district if that is needful. Approach the gas on the intake side, keeping a close watch of the lamps as you proceed. Erect what brattice or canvas may be needed to direct the air onto the gas. Proceed slowly, giving time for the air to dilute and move the gas. Make frequent tests with a lamp to observe progress of the work. This answer assumes holders of first-grade mine foremen's or fireboss' certificates. (c) When the gas has been removed, begin at the intake end of the district and examine each working place and all idle or abandoned places, roads and travelingways for gas and other dangers and enter a report of the examination in the report book. This must be done before permitting any men to return to work.

QUESTION—(a) *What are the general causes of mine fires in non-gaseous mines?* (b) *What precautions should be taken to prevent them?*

ANSWER—(a) Careless use of open lights in proximity to combustible material; use of flame torches in stables, pump and tool shanties, or in handling cars of hay and powder on the shaft bottom or haulways; spontaneous combustion of oily waste; ignition of dust or timber from short-circuited wires not properly installed; and failure to keep fine coal and dust from the waste in mines.

(b) Care in use of open lights; rigid enforcement of strict rules and regulations regarding the handling of combustible material, explosives, oily waste and other supplies; and regular close inspection of all waste and void places in the mine.

QUESTION—*What equipment should be installed with electrically driven pumps and what provision should be made to insure safety, the installation being of a permanent nature?*

ANSWER—The Bituminous Mine Law (Art. 11. Sec. 5) requires every stationary motor underground and its starting resistance to be protected by a fuse on each pole, or circuit-breaking device on at least one pole for d.c. and two poles for a.c. motors, and by switches to cut off the power; such devices to be in a convenient position near the motor. A motor of 100 b.hp. must be further equipped with a meter to indicate the load on the machine. Motors exposed to gas-charged air must have all live parts, starters, terminals and connections enclosed in an explosion-proof casing of incombustible material, which cannot be opened by any unauthorized person.

QUESTION—*What is the capacity of a double-acting pump 12 in. in diameter, running at a piston speed of 120 ft. per min., the efficiency of the pump being 85 per cent?*

ANSWER—The sectional area of the pump cylinder in this case is $0.7854 \times 12^2 = 113.1$ sq.in. Running at a piston speed of 120 ft. per min., the piston displacement is $120 (113.1 \div 144) = 94.25$ cu.ft. per min. Then, since 1 cu.ft. = 7.48 gal., and for a water-end efficiency of 85 per cent, the capacity of this pump is $0.85 (94.25 \times 7.48) = 599.25$ gal. per min.

Anthracite Miners and Operators Resume Wage Parley

Negotiations between the anthracite operators and miners were resumed at Atlantic City on Monday of this week, after more than three weeks' suspension. The U. S. Coal Commission is directly responsible for breaking the deadlock and bringing about the resumption of the conferences. It called the representatives of both sides to New York last week and, after reading notes from them for two days, wound up the proceedings by asking them to state in writing just why they could not get together to prevent a strike on Sept. 1.

The issue of the check-off—the refusal to grant it by the operators and the insistence of the miners that it must be granted before negotiations could proceed—was brushed aside by the miners when it came to the showdown before the Commission and the negotiations are resumed this week as if that issue had not for three weeks threatened to plunge the industry into a strike.

The most significant developments of the week were the operators' acceptance of the miners' offer to abandon the check-off for occupational and all other deductions from pay in exchange for the union dropping the check-off for union dues; the operators' offer to renew the present agreement until April 1, 1925, or to arbitrate wages as well as all other matters in dispute, pledging themselves in such an event not to ask for a reduction; the plain word from Washington that if the miners want to strike the country will have plenty of other fuel offered it, and the backdown of Lewis from his ultimatum of July 26 in the face of a promise by the Coal Commission to tell the country what's what if he wouldn't play ball.

LEWIS MAKES THREE PROPOSITIONS TO COMMISSION

When the hard-coal miners and operators gathered at the Pennsylvania Hotel in New York on the morning of Wednesday, Aug. 15, they found that they had not been called together by the Coal Commission but instead were being asked to report separately on why they had not continued their negotiations at Atlantic City. The Commission had two meeting rooms, and in one they first sat with the representatives of the miners. John L. Lewis wasted no time but at once filed with Mr. Hammond a statement setting forth just what the miners wanted as a precedent to getting back together with the operators. Negotiations had been broken off at Atlantic City on July 27 and Mr. Lewis had issued his ultimatum that the check-off and other features of demand No. 1 must be granted before a contract could be negotiated. His propositions to the Commission were three, one that private detectives in the pay of the operators in the mining region must be withdrawn, the second that the miners would agree to withdraw their demand for the check-off if the operators would agree to cease checking off, that is making deductions for items owed the company. His third was that if the operators would agree that they would give the check-off and agree in principle to a wage increase, they would start negotiations at once and promise to keep at work after Sept. 1, making any settlement retroactive to that date. This was transmitted to the operators late in the afternoon. The second proposal was stated as follows:

"That the United Mine Workers abandon its demand for a provision in the next contract providing for participating in the check-off arrangement; that in consideration of such abandonment the anthracite operators agree to a provision in the next contract whereby they will abandon their age-old practice of checking off from their employees payment for the long list of items herein incorporated, and such others as may exist.

"Upon this proposition the United Mine Workers desire a categorical reply from the anthracite operators through the United States Coal Commission. If the anthracite operators agree with this suggestion it will remove any obstacle which may now exist in prevention of an immediate resumption of joint wage negotiations. If the anthracite operators refuse this suggestion then the American people will understand the true selfishness of their position and the United States Coal Commission will be able to report to the President of the United States and properly place the re-

sponsibility for any suspension of anthracite production."

As an alternative it was offered by Mr. Lewis that the following should be accepted:

"The representatives of the United Mine Workers have full appreciation of the natural desire of the coal consuming public to avert a suspension of production after Sept. 1. The mine workers join in this desire, and in consideration of the emergency which exists in the premises propose the following arrangement, which will relieve public apprehension and be endorsed by every citizen:

"That the anthracite operators agree that all men now working nine hours or more shall be given an eight-hour day with commensurate compensation, effective as of Sept. 1; that the necessity of a wage increase be recognized; that the United Mine Workers be accorded the privilege and convenience of the check-off arrangement, effective the same date; that in consideration of such arrangement all other matters be immediately taken up in joint negotiations and the anthracite mines remain in operation pending such negotiations, with a proviso that agreement on all matters when reached shall be retroactive to Sept. 1, 1923.

"In making the foregoing constructive suggestion, the representatives of the United Mine Workers have in mind that the anthracite operators have announced that they agreed in principle with the demand of the mine workers that the eight-hour day apply to all classifications of labor. We also have in mind that in making the check-off arrangement effective Sept. 1, no cost is involved either to the anthracite operators or the consuming public."

Later the same day the anthracite operators gave out their acceptance of the proposal to abandon the checkoff of all items of debt incurred by their employees. Their letter addressed to the Coal Commission follows:

OPERATORS AGREE TO DISCONTINUE DEDUCTIONS

"The Anthracite Operators are gratified to note the willingness of the miners' representative to abandon their Demand No. 1, calling for the 'check-off,' on condition that the operators discontinue the practice of deducting from the wages of employees certain specified items.

"The operators accept this proposition. They are prepared to agree in so far as the law of Pennsylvania will permit, to incorporate in the wage agreement a clause discontinuing the present practice, and placing the business upon a cash basis.

"Heretofore, the operators have extended credit to the men for the purposes named, charging the men's accounts currently and deducting the charges when wages were paid. The operators had assumed that this practice met with the approval of the employees since heretofore such practice has never been presented as a grievance. Neither did the eleven demands presented by the miners at Atlantic City embody any request to abandon this practice.

"If now the employees desire a discontinuance of the present practice, the operators are entirely agreeable. The existing practice having been put into effect for the convenience of the men, some inconvenience to them may result from its discontinuance. The operators, however, will be pleased to co-operate with their employees in working out methods which will reduce such inconvenience to a minimum.

"In agreeing to the foregoing, the operators assume that in accordance with the miners' proposition to your Commission, negotiations will be promptly resumed and that no suspension will take place September first, it being understood that the wage agreement, when consummated, will be retroactive to that date."

No statement was forthcoming from the union headquarters on Wednesday night after the operators filed their acceptance. Early Thursday morning Mr. Lewis talked to the newspaper men and indicated that the union men were not pleased with the form of Mr. Warriner's letter and that they would take exception to everything in it. Late that day they filed a reply, again to the Commission, stating that in their opinion the operators had not met their proposal. The letter follows, in full:

"The mine workers' representatives have given careful

ANTHRACITE CONFERENCE AT PENNSYLVANIA HOTEL, NEW YORK

Seated, left to right—Thomas Kennedy, president of District 7, United Mine Workers; John L. Lewis, International president, United Mine Workers; John Hays Hammond, chairman of the Federal Coal Commission; Thomas R. Marshall, member of the Commission, and George Otis Smith, another member.
 Standing—E. E. Hunt, secretary of Commission; C. J. Golden, president District 9 United Mine Workers; Rinaldo Cappeleni, president District 1, United Mine Workers, and Dr. Charles P. Neill, Commissioner.

consideration to the letter filed with your Honorable Commission by Mr. Warriner. We do not believe that the communication constitutes a good faith acceptance of the proposal made by the mine workers yesterday for the abandonment of the present check-off system by the anthracite operators and the waiving of the check off demand by the United Mine Workers.

"The first paragraph of Mr. Warriner's letter expresses gratification that the mine workers have abandoned demand No. 1. The mine workers made no such offer, as their letter referred only to the check-off feature of demand No. 1. The operators' statement on this feature is therefore in error.

"The second paragraph of the operators' letter qualifies their acceptance by inferring that the laws of Pennsylvania will prohibit them discontinuing the practice. They have always heretofore insisted that the law prohibited them from instituting the practice. It is obvious and perfectly manifest to all that no written agreement could transcend the law of the Commonwealth or the Federal Government. The introduction of this qualification is therefore without warrant.

"The third paragraph of the operators' letter purposes to understand that the United Mine Workers desire that the anthracite operators desist from extending credit to their employees in commercial transactions. No such feature was incorporated in the mine workers' presentation, and neither do the mine workers propose to countenance such change. This matter is therefore extraneous and its introduction into a discussion of the check-off is not accepted by the mine workers' representatives.

"In the fourth paragraph of the operators' letter, Mr. Warriner proposes that the anthracite operators will deal with their employees individually in working out such matters. The miners in the anthracite region are members of the United Mine Workers and have given authority to certain officers of their organization to represent them upon all such matters. We therefore advise that the anthracite operators will not be able to deal with their employees upon an individual basis affecting this matter, and that the proposition in its entirety has nothing to do with the check-off proposal of the United Mine Workers.

"The closing paragraph of Mr. Warriner's letter states the operators' assumption that in agreeing to the abandonment of the operators' check-off system that no suspension will take place Sept. 1, in event a wage agreement is not

negotiated at that time. The anthracite operators are again strangely in error in this matter. Your Commission will recall that the representatives of the mine workers filed with your honorable body yesterday an alternative proposal calling for the operation of the anthracite mines after Sept. 1. This proposal has been ignored by the anthracite operators' representatives and we assume has been rejected by them. The matter of working after the first of September has no relation to the mine workers' proposal that the operators abandon their check-off system.

"The operators' letter is misleading and confusing in its every paragraph. The mine workers cannot accept it as an interpretation of their previous proposition. We made a fair proposal dealing exclusively with the check-off proposition and requested therein a categorical reply to the offer. Such reply has not been forthcoming. If a good faith assent is given to the mine workers' proposition, joint wage negotiations can be immediately reopened and there is no proper reason why an agreement cannot be negotiated prior to Sept. first and a suspension of anthracite production averted."

The operators promptly gave out a statement characterizing the miners refusal as an indication of their desire to avoid the issue. Mr. Warriner said that "The efforts of the operators to reach a peaceful adjustment by what they believe to be an acceptance of the miners' proposition of yesterday seem to have failed. The operators have earnestly sought to settle differences by peaceful negotiation or arbitration. They have offered and now offer either or both of these courses. The miners reject these peaceful courses and insist upon their demands under threat of a strike. They refuse arbitration and even insist upon the granting of a large part of their demands as the condition precedent to negotiation. The fundamental issue is whether or not force or reason is to be the accepted basis of adjusting disputes in this basic industry.

"Mr. Lewis' criticism of our acceptance of his proposal of yesterday is without a constructive or conciliatory note, and indicates a determination to avoid a settlement except upon his own terms. His proposal was obviously advanced to avoid a break over the issue of the closed shop with the 'check-off' but when the operators accepted it, he informs them, through the Commission, that the closed shop demand is not abandoned and that he did not intend by this proposal to give a pledge that there would be no strike.

"In view of the present situation, we propose to ask the Commission to state definitely to the public the issues involved in this controversy."

At about the same time, and after several hours conference behind closed doors with the operators, Mr. Hammond authorized a statement to the effect that the Commission was discouraged over the situation.

The air cleared the next day, for on Friday morning the Commission addressed a letter to both Mr. Warriner and to Mr. Lewis asking them to get together as the country needed the coal. Commissioner Smith had previously told the newspaper men that the two parties were writing letters that the other side could not understand and that the Commission could understand neither. The Commission's letter follows:

"The committees appointed respectively by the anthracite operators and mine workers to negotiate a new contract to replace the existing one which expires Sept. 1, have been in complete deadlock since July 27, and from that date until Aug. 14 not even a meeting was held in an effort to negotiate a new agreement.

"Now more than two days have been spent in a fruitless effort to find a basis upon which to bring about a resumption of negotiations, and in the exchange of notes between the parties thereto, through the medium of the commission, it has been found impossible to have the language of those notes construed to mean the same thing to both of the parties.

"There now remain only fourteen days before the present contract expires. The public mind, with a keen realization of the suffering of last winter because of an inadequate supply of anthracite is beginning to be seriously alarmed over the question of whether there is to be another suspension of anthracite mining on Sept. 1 of this year.

"It is imperative that this uncertainty be cleared up at once. We therefore urge that the representatives of the two sides enter into a conference to consider and report to us:

"(1) Whether you can reach an agreement over the matters now in dispute and negotiate a new agreement by Sept. 1.

"(2) Whether, in the event of your inability by Sept. 1 to reach agreement upon the matters in controversy, you can agree on a plan that will assure a continuance of mining after Sept. 1 and until you have reached an agreement.

"(3) Whether, in the event that you find yourselves unable to reach a complete agreement upon the matters in controversy, you can agree upon some plan for an orderly and peaceable settlement of the matters in controversy on which an agreement cannot be reached by contract negotiations, and thus prevent a suspension of mining as a result of the present controversy.

"The Commission asks that you go into joint session immediately and reply in writing by 8 o'clock to-night."

BOTH SIDES PROMPTLY AGREE TO RECONVENE

The response was prompt and to the point. Both sides held executive meetings and then they gathered together as a joint committee with James A. Gorman as their secretary, and shortly after lunch sent forth the word that they had agreed to take matters up in joint conference at Atlantic City on Monday, Aug. 20 just where they left off before Lewis issued his ultimatum on July 26. Their joint letter to the Commission, that sent them all scurrying for the ticket office and home, read as follows:

"The Joint Conference of Anthracite Miners and Operators has directed me to reply to your letter of even date requesting representation of the two sides to immediately enter into a conference, and submitting certain questions, as follows:

(1) In view of the Commission's request, and the public interest and apprehension, the miners and operators will, without prejudice, meet in joint conference Monday next, 11 a.m., at Atlantic City, and will earnestly endeavor to reach an agreement by Sept. 1.

(2) The operators urged that an understanding be reached providing that no suspension take place September 1, in case no agreement is reached by that date, and that the new agreement, when executed, be retroactive to that date. The miners asked that this be left to the joint conference.

(3) The operators urged that the parties agree to arbitrate any part of the eleven demands not otherwise disposed of. The mine workers stated that this subject was superseded by the joint action in agreeing to confer."

Condemn Effort to Unionize West Virginia; Commission Asked to Inspect Field

Operators of southern West Virginia are unwilling to contract with the organization of United Mine Workers of America, according to a voluminous brief filed Aug. 18 with the U. S. Coal Commission by Colonel Henry L. Stimson and Goldthwaite H. Dorr, counsel for the Bituminous Operators' Special Committee. "Wisely or unwisely, they object to placing their labor relations with their men under the absentee control of the International officers of the United Mine Workers' organization at Indianapolis. They point to strikes called by the central organization in districts in which there was no local dispute. They point to the fact that it was only through the existence of the fields which refused to contract with this organization that the public, as the President told Congress, was saved from being entirely at the mercy of that organization during the 1922 nation-wide strike.

"Wisely or unwisely, they are convinced that contracts with that organization are in the interest neither of the operator nor the miner but tend to stifle efficiency and individual initiative, and to create a relationship based not on mutual confidence and sense of responsibility but on mutual hostility. They point to a 20 per cent loss in productivity per worker in the Fairmont field when it contracted with the organization. They point to an 18 per cent increase in efficiency and 15 per cent increase in miners' earnings in the Kanawha field in the mines which have changed from union to non-union operation.

"They are convinced that to contract with that organization is to put the economic future of their fields which have no local markets at the mercy of wage agreements dictated by the International officers in Indianapolis who have a deep-rooted hostility to this field and whose primary interests are elsewhere. They point to the bitter complaints of the operators in the Kanawha field and the states of the Southwest to the effect that the central organization, through arbitrarily dictating wage scales inapplicable to local conditions, has in effect discriminated against those fields.

"They object to the principle of being compelled to employ only members of that organization and to being forced to collect, by the 'check-off,' for that organization such dues and assessments as it sees fit to impose on each worker in their mines."

Urging the members of the Commission to visit the West Virginia mining regions in person, counsel assert that they will find living conditions that compare favorably with any standard. Tables are adduced to show higher earnings by miners in the non-union fields than in bordering union territory. Nowhere in West Virginia, the brief states, will the commissioners discover any mitigation of the crimes presented in 15,375 pages of West Virginia court records growing out of violence alleged in many cases to have been directly instigated or even directed by responsible officials of the miners' union.

Reviewing the bloody attempt of the United Mine Workers to impose the check-off at Willis Branch, Colonel Stimson and Mr. Dorr declare that after the fighting "fire, dynamite and bullets had made the place practically uninhabitable and had made mining impossible." Hundreds of thousands of dollars in damages, they say, were paid out of court by the United Mine Workers of America rather than to have the resultant damage cases come to trial.

John L. Lewis, president of the miners' union, in reply to the brief made the following "square-toed proposition":

"We challenge the non-union operators of southern West Virginia to remove all restrictions and restraint and permit their employees to join the union if they so desire. The union will present its case to these men in a lawful, peaceable and orderly manner; and let the men themselves determine whether they wish to join.

"Of course, it will be necessary for these non-union

operators to agree in advance that they will eliminate all of their gunmen, hired thugs and armed guards during the time this test is in progress, and that they will not permit these brutal desperadoes to interfere in any manner with the men in the exercise of their discretion. Further, it will be necessary for these non-union operators to pledge their word that they will abandon their practice of discriminating against men who do join the union; that they will not discharge employees who become members of the United Mine Workers as they have done in the past and as they are doing today. Otherwise the test would not be a fair one.

"No member or representative of the United Mine Workers will violate any law or create any disturbance in connection with this test of the unorganized employees. If these non-union operators are game they will accept this challenge. If they are a set of welchers, they will refuse it. It will be interesting to see what they do about it."

Fireboss' Attempt to Relight Lamp Causes Explosion That Kills 99 at Kemmerer

Ninety-nine coal miners lost their lives and thirty-five survived in an explosion in Frontier Mine No. 1 of the Kemmerer Coal Co., one mile from Kemmerer, Wyo., at 8 o'clock in the morning of Aug. 14. The last sad rites were held over the bodies of the stricken miners Aug. 17.

About the same time the Coroner's jury returned a verdict finding that the blast was the result of an attempt by the fireboss in room 7, off the thirtieth entry, to relight his safety lamp. The lamp, carried by Thomas Roberts, fireboss, whose body was last taken from the mine, was produced at the inquest by Peter Boam, gas watchman. He declared he found the lamp 12 ft. from the face of room No. 7, close to the spot where the body of Roberts was found. The top and bottom were 2 ft. apart and a match apparently recently lighted, with evidences of being burned on the head only, was found a few inches from the bottom part of the lamp, he testified.

P. F. Patterson, state mine inspector, testified that on May 17 he had found the mine in good condition with adequate air.

Joe Nadi and Tony Davich were heroes of the disaster, having locked twenty-seven men within a slope barricade, until the death tunnel on the 1,700 ft. level was partly cleared from blackdamp. Twenty-two of this number were rescued alive. The explosion occurred between slopes 15 and 17, about a mile from the entrance of the mine. A cave-in on the 1,700 ft. level soon after the explosion and the bursting of a water main greatly hampered rescue work.

District Judge John R. Arnold, of Evanston, is at Kemmerer to begin payment of compensation to the survivors of the blast victims, in accordance with the Wyoming law relating to workmen's compensation. The fund will be depleted at least \$200,000 by the blast, he said.

P. J. Quealy, president of the company, is doing everything possible for the survivors and the victims' families. A relief organization has been formed.

Danger in Check-Off, Says Dr. Eliot

Declaring that the "check-off" demanded by the United Mine Workers of America is illegal and that it would be a violation of the Federal Anti-Trust Law, Dr. Charles W. Eliot, president emeritus of Harvard University, in a letter to the General Committee of Anthracite Operators, says the insistence of the United Mine Workers on the adoption by all coal operators of the "check-off" is "much more than a threat of 'no anthracite' for the American people. It is a declaration of purpose of the United Mine Workers to force the closed shop on all coal operators throughout the country, and through the establishment of the closed shop, control all American industries and the Government itself. Hence the necessity of submitting to the thinking public the operators' reasons for refusing the demand for the check-off."

Dr. Eliot says that the union boldly avows a policy of resorting to a general tie-up all over the country rather than accept arbitration, as the operators have done, in cases where collective bargaining fails to reach an agreement.

"If the operators," he says, "should agree to join the United Mine Workers in creating an ironclad and irresistible monopoly in mining coal, they would not only betray the interests of the entire consuming public but also make themselves violators of the law. They should not violate the law to save themselves from financial loss, and do not propose to do so."

"The closed shop throughout an entire industry has been declared illegal by every high court which has passed upon the matter. As late as June 30, 1923, a federal court said: 'Monopolies are especially intolerable where they concern the basic resource of individual existence, to wit, the capacity to labor. . . . This is an old and familiar doctrine in whose maintenance none have so deep a concern as the poor, the humble and those who live by the labor of their hands.' The Supreme Court of the United States has declared that 'There is no more sacred right of citizenship than the right to pursue unmolested a lawful employment in a lawful manner. It is nothing more nor less than the sacred right to labor.'

"Hence it follows that maintenance of the open shop in the chief American industries, especially those which deal with foods, fuels and transportation, should henceforth be a prime object with every lover of his country and democracy. How little has been accomplished toward the open shop since 1903, when the Roosevelt award forbade discrimination on account of membership or non-membership in a labor union!

"The closed shop also puts into the hands of the unions the power to reduce the volume of production by ordering every worker to 'go slow.' The 'slacking' is the most disastrous practice which has ever found place in the American industries, and presents the most serious danger for their future. It destroys the alertness, energy, self-reliance and sense of responsibility which formerly characterized all American labor, and is inconsistent with the maintenance of individual self-respect."

Bituminous Coal Loaded Into Vessels at Lake Erie Ports During Season to End of June*

Coal Commission Optimistic on Wage Parley; to Fix Responsibility if Conferees Fail to Agree

Expressing optimism that resumption of negotiations between the anthracite operators and miners will result in an agreement, so that work in the hard-coal fields may continue without interruption, but asserting that should there be a failure to do so they will report the facts and fix responsibility and make "appropriate" recommendations to the President, members of the U. S. Coal Commission returned to Washington Saturday from their conferences in New York with operators and miners which brought about an agreement to resume negotiations Aug. 20.

While the atmosphere of official Washington is hopeful that the crisis in the anthracite situation has passed and that from the reopened negotiations will come, if not an immediate agreement on all points at issue, at least an arrangement by which work will continue without interruption, spokesmen for the administration have let it be known that plans have been perfected to forward heavy shipments of substitutes for hard coal—bituminous coal and coke—into the anthracite-consuming sections if there be a cessation of operations in the collieries Sept. 1, or at any date.

Although "a cessation of production of any essential commodity cannot be viewed as a pleasant prospect," to use the words of one high government official, and it is realized that to provide substitutes would entail longer railroad hauls in many cases, place a strain upon open-top car supply and create other problems, yet the plan, it is felt, will insure the people and the industries of the anthracite-consuming regions against suffering from cold or a shutdown of plants.

WADLEIGH TO DIRECT DISTRIBUTION OF SUBSTITUTES

F. R. Wadleigh, Federal Fuel Distributor, will be placed in charge of distribution of substitutes if production of anthracite ceases. The broad powers of the Interstate Commerce Commission will be employed to execute the plan. Mr. Wadleigh's office as Federal Fuel Distributor expires by limitation Sept. 22, but it is pointed out that he can be appointed an agent by the Interstate Commerce Commission, and this will be done if the necessity arises.

For several months Mr. Wadleigh has been making a special study of transportation of coal, and this, added to his broad experience in fuel matters, it is felt by officials, marks him as the logical authority to place the system of distributing anthracite substitutes in operation if that action becomes necessary.

The National Coal Association, through its president, J. C. Brydon, speaking for the bituminous operators, has offered a plan to the government to supply soft coal to the anthracite-consuming areas, with voluntary committees of operators to assist and with traffic experts to aid the distribution, at the same time agreeing in advance to submit to voluntary price-regulation or supervision by the government. The plan in view by the government will be a government plan, but it is highly probable that the offer of the bituminous operators will be accepted in part should occasion arise.

It is evident that in the event of another deadlock between the anthracite miners and operators at Atlantic City the Coal Commission will resort to an appeal to public opinion, through a statement which will attempt to fix in the public mind the responsibility for the condition. The Commission will receive daily reports of the proceedings at the Atlantic City conference.

Immediately after their return from New York, where they had summoned in conference committees representing the hard-coal producers and the workers in those fields, Chairman John Hays Hammond and Dr. George Otis Smith, of the Commission, conferred with President Coolidge, remaining with the chief executive half an hour. They submitted a written report and discussed the subject more intimately than was possible in this document.

Speaking to newspaper men after his conference with the President, Chairman Hammond said: "I don't think that

intelligent men can afford to commit suicide at this time. It would be suicidal for either party to be responsible for the suspension of industry. I have too high a regard for the operators and miners to think they would commit such an egregious error, and yet such things have been."

The text of the report submitted by the Coal Commission to the President follows:

"The U. S. Coal Commission, in the discharge of what is believed to be its function, having obtained knowledge that the conference between the operators and the miners in the anthracite region had come to a deadlock, and that negotiations had been discontinued on the 27th day of July, 1923, and that no steps had been taken by either party to reconvene the conference, requested the parties thereto to appear before the commission at the Pennsylvania Hotel, in the city of New York, upon Wednesday, the 15th day of August, 1923, at 3 o'clock p.m.

"At that date and hour the parties appeared and the commission took up with them in turn in executive session the conditions which caused the deadlock and questions in controversy.

"After two days of continuous examination the commission deemed it advisable to address the following letter to the parties in controversy: [The report here quoted the letters addressed by Chairman Hammond of the Coal Commission to John L. Lewis, representative of the mine workers, and Samuel D. Warriner, representative of the operators, under date of Aug. 17, calling upon them to enter into conference, and addressed by James A. Gorman, secretary of the joint conference, in reply to Mr. Hammond, announcing that the parties to the controversy had agreed to resume conferences at Atlantic City, Aug. 20.]

"The Commission does not believe it is in the public interest or helpful in the negotiations to be resumed at Atlantic City for it to report the details of the statements made by the several parties before it in conference.

"The Commission will keep in constant touch with said negotiations, and has the promise of both parties that it shall be informed day by day by the secretary of the joint conference of the progress made, or attempted to be made, in reaching a solution of the question involved in keeping the mines open.

"The Commission ventures to express the hope that a prompt agreement at Atlantic City may render unnecessary any further report on this subject, but if there shall be a failure to negotiate a new contract at Atlantic City before the 31st day of August or a failure to agree upon some method of keeping the mines open until a new contract shall be agreed upon, the Commission will report the facts, fix what it believes to be the responsibility and make such recommendations to you as under the circumstances and the law it may deem appropriate.

"In the meantime, if the reports received daily from Atlantic City shall lead the commission to the conclusion that an emergency report is necessary, the same will be promptly made."

Bids Received for Supplying U. S. Army Coal

Thirteen bids were received by the U. S. Shipping Board, New York City, Aug. 13 for furnishing and delivering, f.a.s. vessels of the United States Line, New York harbor, eight months supply of coal, with an alternative of one year's supply. Bidders were privileged to submit prices on Pennsylvania or West Virginia Pool 1 coals, or on coals on the United States Navy acceptable list. Three separate bids were received for furnishing and delivering Pocahontas or New River coals, the prices ranging from \$6.59 to \$7.93 f.o.b. mine. Prices submitted in the remaining ten bids ranged from \$6.29 to \$7.52 per gross ton, or on a basis of about \$3.16 to \$4 per net ton f.o.b. mine. Bidders can be required to supply 15,000 tons per month.

Production and the Market

Weekly Review

The market for both bituminous coal and anthracite is sensitive to a marked degree over the anthracite situation. Last Thursday morning it was announced that miners and operators had settled the check-off question and that the danger of the strike on Sept. 1 was averted. Immediately the top level of independent quotations on domestic anthracite dropped a dollar. The same night it was announced that settlement had been upset. The next morning these independent quotations went up 75c.

Production of bituminous coal is now nearly 11,000,000 tons per week. An increase of 10 or even 5 per cent in demand would change the situation over night from a buyers' to a sellers' market and inside of two weeks the soft-coal operators would be charging their lost operating time to "car shortage" instead of, as now, to "no market." A strike or the certainty of a strike in the anthracite region would soon throw an added load of from 10 to 20 per cent on the Eastern soft-coal fields that are in position to furnish substitutes for anthracite. Under such circumstances nothing but voluntary action, such as has been promised by the soft coal operators, would serve to keep down the price.

PRICE INDEX REGISTERS SLIGHT INCREASE

Coal Age Index of spot prices of bituminous coal at the mines gained one point last week and on Aug. 20 was 197, which corresponds to an average price of \$2.38. Throughout the East there has been some buying of soft coal to replace anthracite and a flood of inquiries have been received by the distributors of both coal and coke, particularly those in the Pittsburgh district. Industrial buying has been quiet but regular in the past six weeks and practically all large consumers in New England now have more than 90 days' supply on hand. The railroads on Aug. 1 had 14,000,000 tons of reserve of which more than 11,500,000 was in stockpiles. This exceeds railroad fuel stocks at the end of the war, which

were the highest recorded up to that time. The railroads put 3,500,000 tons of coal in storage in July.

Nearly one-sixth of the total bituminous coal produced in July was used in the manufacture of coke, which goes for the most part to the iron and steel industry. The high production records now being set up in the iron and steel industry account for a large part of the heavy production and consumption of bituminous coal this summer. Because a great deal of coal thus used comes from mines, owned and occupied by the steel producers, the heavy demand from these sources has had no effect on the commercial market.

LAKE COAL DUMPED (Net Tons)

	Week Ended Aug. 20	Season to Aug. 20
Cargo	935,882	16,955,167
Fuel	54,022	859,828
Totals	989,904	17,814,995

All-rail shipments of bituminous coal and anthracite continue in heavy volume to New England, the anthracite movement in the first half of August exceeding 8,000 cars and the soft-coal movement exceeding 9,000 cars. In July more than 1,000,000 tons of soft coal was shipped to New England by water, mainly from southern West Virginia via Hampton Roads.

Estimates of Production

(Net tons)

BITUMINOUS

	1922	1923
July 28 (b)	3,952,000	10,817,000
Aug. 4 (b)	4,313,000	10,565,000
Aug. 11 (a)	4,606,000	9,978,000
Daily average	768,000	1,890,000
Calendar year	212,214,000	334,974,000
Daily av. cal. year	1,120,000	1,779,000

ANTHRACITE

July 28	27,000	2,080,000
Aug. 4	29,000	2,018,000
Aug. 11	40,000	1,735,000
Calendar year	23,504,000	62,569,000

COKE

Aug. 4	110,000	345,000
Aug. 11 (a)	112,000	327,000
Calendar year	3,849,000	12,192,000

(a) Subject to revision. (b) Revised from last report.

Movement of soft coal up the Lakes is at the rate of more than a million tons per week, the total to date being about 2,000,000 tons ahead of 1921, the best year in the last four. Anthracite shipments up the Lakes through the port of Buffalo were 1,747,520 tons for the season up to Aug. 14, as compared with more than 2,300,000 the same date in 1921, which figures refute the charges commonly made that all the anthracite is being sent west this summer.

Anthracite production continues at the high rate of around 2,000,000 net tons per week. The market for steam sizes of anthracite is better than for some time and the entire product, domestic and steam, is moving forward to the consumer as fast as produced.

The production of beehive coke is slowly but surely declining.

Chicago Hopes for General Improvement

Despite uncertainty due to the hard-coal negotiations conditions in Chicago last week were such as to stimulate

buying in certain quarters and warrant hopes for a general improvement. Prominent factors in the market are of the opinion that should a settlement of the hard-coal controversy be reached without a strike it would not materially affect the undercurrent betterment that is beginning to make itself felt in soft-coal circles.

Domestic sizes showed some improvement, although the general demand is still hesitant and buying by city dealers is not yet up to expectations. Country dealers were very active during the past week. The situation is due to a combination of increased demand, restricted car movement, and the piling up of low-volatile slack.

In southern Illinois screenings are better maintained at \$1.75 than they have been at any time in recent weeks, due to the depletion of surplus stocks which were a bar to an improvement earlier in the summer, and the slowing up of railroad buying. Domestic demand is light in the city, but is registering a steady improvement in the country. Lump in general is held at circular and the tendency toward a 50c. or more shading is less in evidence than it was a week ago.

In Central Illinois conditions are not of the best, although

* Net tons, f.o.b. mines.

† Advances over previous week shown in heavy type, declines in italics.

Index	1923				1922
	Aug. 20	Aug. 13	Aug. 6	Aug. 21	
Weighted average price	197	196	195	530	
	\$2.38	\$2.37	\$2.26	\$6.41	

This diagram shows the relative, not the actual, prices on four-teen coals, representative of nearly 90 per cent of the bituminous output of the United States weighted first with respect to the proportions each of slack, prepared and run-of-mine normally shipped, and second, with respect to the tonnage of each normally produced. The average thus obtained was compared with the average for the twelve months ended June, 1914, as 100, after the manner adopted in the report on "Prices of Coal and Coke, 1913, 1918," published by the Geological Survey and the War Industries Board.

there is a disposition among distributors to respond to improvement in tone. Indiana reports a stronger demand for domestic sizes from the Fourth Vein with prices inclined to reach a higher level and rule a little firmer on the upper ranges.

A slight increase in orders for domestic coals is noted in the Carterville field, while steam sizes continue quiet. In the Standard district mines are operating $1\frac{1}{2}$ to $2\frac{1}{2}$ days a week while there is considerable difficulty being experienced in selling the steam sizes.

St. Louis Notes Increased Inquiries

A slight increase in the retail trade has been noted in St. Louis and additional inquiries from consumers indicate that more interest is being shown in their fuel supply. The increased inquiry comes for the high-grade southern Illinois domestic sizes. There is little demand for anthracite, smokeless or coke and since the dealers of St. Louis are known to have a larger supply of anthracite tonnage in proportion to the amount used than other cities, it is not likely to suffer in the event of a suspension of operations in the anthracite fields. There is little demand for anthracite from the country, as most points have been supplied by earlier shipments.

Things continue a trifle draggy with the western

Kentucky operators and prices on screenings have been a shade weaker, due to better demand and larger production of prepared coal, which is moving north, northwest, central and south. Operators believe that September will bring a better volume of business, and probably better prices. In fact business for September delivery isn't being accepted at present prices by many operators.

Movement Better in Louisville Market

Reports in the Louisville market show that movement of coal is better, and that more buyers are entering the field for prepared coal, as well as steam. Movement of prepared coal is now more general, with larger Southern buying, while steam coal demand is taking up screenings quite well at low prices.

Better inquiry is being received from the gas companies, with better utility buying and fair movement to steel and metal-working plants. Railroad buying is not heavy, but consumption on contracts is good. Fair movement to the Lakes has been reported, which is tending toward heavy production of screenings.

Retailers have been buying more freely, as they have about decided that prices are as low as they are likely to go this fall or for some months to come, unless an open winter and good car supply prevail.

No Anthracite Arrivals at Duluth

For the first time this year since the opening of navigation no anthracite arrived at the Head-of-the-Lakes during the past week, despite the fact that 50 cargoes of soft coal came in. In the thirty-four cargoes reported on the way from lower lake ports five are hard coal. Official figures of anthracite shipments show that 717,600 tons of hard coal had been received at the docks up to Aug. 1. It is assumed that at least 225,000 tons additional will be received at the docks during August.

One thing which is likely to curtail the use of hard coal at Duluth and also cut down the tonnage necessary is the evident determination of various consumers of hard coal to use substitutes this winter. Total bituminous receipts this year to Aug. 1 are 5,324,400 tons.

Anthracite is being shipped from Duluth to Winnipeg and even to points west of Winnipeg. The Port Arthur and Fort William dealers who usually supply the Winnipeg market complain of being unable to get any anthracite from lower lake ports.

The recent recommendation of the examiner in the I.C.C. hearing on the southern Illinois-Head-of-the-Lakes rate dispute has reassured dock men.

Prices are as follows: Youghiogheny and Hocking: lump, \$6.25@6.50; run of pile, \$5.25@5.50; screenings, \$3.75@4. Splint: lump, \$6.75; screenings, \$4@4.25. Pocahontas: lump, \$9@10; run of pile, \$6.50; screenings, \$6. Kentucky: lump, \$7.50; run of pile, \$6.75; screenings, \$4@4.25.

Active Anthracite Demand at Milwaukee

An active trade in anthracite is the dominant feature of the market at Milwaukee. The yards have plenty of room for hard coal, but soft-coal storage facilities are slowly being exhausted. Soft coal is being taken quite freely, but it is expected that there will be a marked check in receipts by the end of this month unless the outward movement increases. There is some agitation in the newspapers over the fact that the popular grades of anthracite are \$1.70 cheaper at Duluth than at Milwaukee and that ports nearer to Milwaukee also are retailing coal at from 25c. to 50c. per ton less than Milwaukee. Receipts of coal by lake during the first half of August aggregated 78,102 tons of anthracite and 133,036 tons of soft coal, making the cargo receipts since the opening of navigation 531,410 tons of anthracite and 1,681,782 tons of soft coal.

Demand for Kansas and Oklahoma coal, as well as for Arkansas semi-anthracite is beginning to pick up. Reports received by the Southwestern Interstate Coal Operators' Association indicate that the mines are now working an average of three days a week, while a week ago they averaged around two days.

Salt Lake City retail dealers have received many storage orders. Operators report a quiet market, but are optimistic.

Interest Awakens in Ohio Markets

The trade at Cincinnati is interested in the number of inquiries received last week, although they were not as productive of orders as they might have been. Prices showed more strength. The awakening of interest is attributed to the probability of trouble in the hard-coal fields. Demand for the low-volatile coals continues strong. West Virginia 2-in. lump is quoted at \$2.75, as compared with \$2.50@2.75 last week, and southeastern Kentucky 2-in. lump at \$2.75@3, as compared with last week's quotation of \$2.75.

A slight improvement in the demand for domestic coals at Columbus is reported. Due to better business from the consumer, retail dealers are showing a disposition to buy more, especially Pocahontas, New River and splint varieties. There is a fair demand for the steam coals. Railroads are not taking as large a tonnage as formerly, while public institutions and utilities are taking only a fair tonnage. No change in market conditions is reported from Cleveland. Little storing is being done, most consumers buying as they need the coal.

Domestic Coal Moving at Pittsburgh

There is no change in general conditions in the Pittsburgh district. Domestic coal is beginning to move with some freedom and the market for good grades is about \$3@3.25. It is estimated at Pittsburgh that about 1,000,000 tons of lake coal remains to be covered. A strengthening of the central Pennsylvania market was noticed at Altoona, more orders being received from Eastern consumers and at somewhat better figures than a week previous. The market at Buffalo remains quiet.

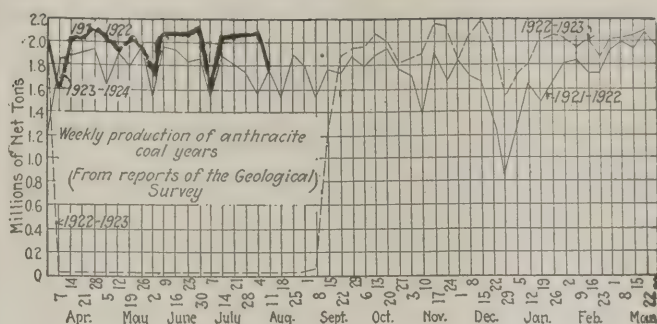

New England Market Still Apathetic

In New England the market shows no improvement. Buyers continue apathetic and there is so much coal offered that consumers have no idea of increasing their present large reserves. The textile mills in particular have used much less than anticipated, and there are almost no signs of better inquiry ahead.

Hampton Roads prices average lower than a week ago. Quotations still range around \$5.50 per gross ton f.o.b. vessel for No. 1 Navy standard, but a few actual sales have been made as low as \$5.10@5.25. There is practically no distress coal at this end, and for that reason prices on cars at Boston, Providence and Portland are a shade firmer. While Pocahontas and New River have sold at \$6.75 on cars Boston, the prevailing price is now nearer \$7 while certain factors are asking \$7.15.

Receipts all-rail from central Pennsylvania continue on a light basis. Shippers of even the most favorably known grades are actively canvassing for August and September business and prices are down to the cost of production. Prices on the medium and low grades show no change; in fact most of the low-grade operations are shut down until demand improves.

A fair volume is moving via New York and Philadelphia piers, although at New York there are beginning to be accumulations. The actual tonnage dumped this month at the Philadelphia terminals will not compare favorably with tonnage handled in July, but the amount of coal via this route holds up more consistently than coal from the same districts all-rail.

Buying on Increase in Seaboard Markets

Inquiries for soft coal increased in New York and Philadelphia during the week, and while not much new business developed shippers agreed that buying should increase from now on. There was some expectation among the New York trade that the drawn-out wage negotiations of the anthracite operators and miners would lead to a stronger market. Considerable interest was taken in the prices received by the U. S. Shipping Board on Aug. 13 for supplying coal to the vessels in New York harbor. Efforts made to introduce soft coal as a domestic fuel are not meeting with the success expected. The soft-coal market at Baltimore is quiet, due to a slump in the export trade. Mines in some of the Southern districts, which were damaged by severe wind and rain storms in the middle of August are beginning to recover. There is little demand for high-volatile coal for export. At Birmingham the market remains quiet, though there is a feeling that the trend is toward more activity. Production during the week ended Aug. 4 is reported at 343,000 tons.

The export market is dull. Inquiries have fallen and most of the business now moving is said to be on old orders. During the first twelve days of August four vessels left Baltimore for foreign countries carrying 18,469 tons of cargo and bunker coal.

Anthracite Market Reacts to Wage Parley

The anthracite market was more or less affected by the favorable impression gained early in the week that the wage negotiations were in a way to early settlement. Some shippers' quotations for independent quotations eased at once only to be partly regained within the next twenty-four hours when the union leaders further explained their offer to the operators. There has been no lessening in demand for domestic coals and steam coals are moving well. The coal fields continue to be thoroughly covered by buyers, who in some cases are bidding against each other. Stove coal continues to be the most desired size, with chestnut a close second. In the New York market egg coal demand is easier and some retail dealers are said to have small tonnages of it, as well as of pea coal, in their bins. Notwithstanding the heavy output retail dealers continue to receive orders, which with the orders already unfilled on their books absorb their receipts rapidly.

A steady demand for anthracite continues to make the hard-coal market at Toronto strong. Although retailers are experiencing no great difficulty in obtaining supplies, anthracite is none too plentiful.

Production of beehive coke continued to decline during the week ended Aug. 11, the Geological Survey reporting the total output to be estimated at 327,000 net tons, a decrease of 18,000 tons as compared with the previous week. The cumulative output of beehive coke during the present year to Aug. 11 stands at 12,192,000 net tons.

Foreign Market And Export News

Great Britain's Coal Output Increases; Operators Watching Anthracite Wage Conference

Output of coal continues to increase in Great Britain, 5,250,000 tons having been produced during the week ended Aug. 4, says a cable to *Coal Age*. The output for the previous week was 5,112,000 tons.

With the exception of a few of the better grades of large coals, supplies are sufficient to take care of the demand. Mine owners are watching developments in the wage negotiations between the anthracite mine owners and workers.

The Welsh steam coal trade has shown marked improvement. European and Canadian business increased, while the French and Italian railways have sent in bookings for about 400,000 tons of locomotive coals. Some of the best Admiralty mines are definitely out of the market until November. Prices generally are steadier. The anthracite market is good.

Newcastle improved slightly and inquiries increased. German business is slow; France, Italy and Belgium business is quiet and U. S. competition is being felt in the Mediterranean. Contracts reported include Zeebrugge, 12,000 tons best Durham coking; European gasworks, 6,000 tons Wear special gas. Other Continental gasworks are inquiring for quantities ranging from 5,000 tons to 40,000 tons of good gas coals.

French Coal Production for June Shows Large Increases

The coal market in France remains favorable, although prices for British and Belgium coals are still high. Supplies of industrial coals are fairly adequate to meet the requirements, while the recent decision of the Belgian Government for the re-establishment of export licenses for house-coals is believed to have caused a large cut in imports. The decision is believed to be due to the excessive prices charged by Belgian collieries. Owing to high prices the marketing of British coals in France has become almost impossible and has caused much uneasiness.

Shipments of coke from the Ruhr received by the S.C.O.F. during July

amounted to about 70,000 tons, as compared with 161,000 tons in June, the decline in the tonnage received being due in part to the bad loading facilities. In order to avoid as much as possible the exhaustion of stocks, the working of some of the coke-oven batteries in the Ruhr is being planned by the French authorities.

Contrary to the assertions made in the German press, the shipping of coal from the Ruhr to Italy has never been stopped, special regulations having lately been fixed by both French and German authorities.

Germany delivered to the Allies during 1922 9,076,000 tons of fuel, while the Commission for Reparations had previously fixed the amount to 11,536,700 tons. Of this amount, France has received 4,247,425 tons of coal, as against 5,308,400 tons fixed by the Commission for Reparations, and 4,340,154 tons of coke, instead of 5,333,300 tons.

The French mines output for June was 3,254,903 tons of coal and 70,813 tons of lignite, as compared with 3,060,061 tons of coal and 79,016 tons of lignite, in May. During the first six months of the year coal production amounted to 18,093,091 tons, as compared with 15,560,400 for the same period of time during 1922.

The total output of coal of the Nord and the Pas-de-Calais for the month of June was 1,785,765 tons, as compared with 1,648,445 in May.

The output in coke during June was 161,130 tons, as compared with 161,943 in May. In the devastated mines of the Nord and Pas-de-Calais, the production of coke in June was 108,149 tons, as compared with 104,740 in May.

There was produced during the first six months of 1923, 882,100 tons of coke, as compared with 464,300 tons for the same period in 1922.

Production of patent fuel during June amounted to 257,793 tons, as compared with 213,000 tons in May, while the devastated mines of the Nord and Pas-de-Calais produced 130,617 tons, as compared with 110,321 tons in May. For

the first six months of the year France produced 1,465,800 tons of patent fuel, as compared with 1,295,200 tons in the first six months of last year.

Production in the Sarre during June amounted to 1,025,716 tons of coal and 11,119 tons of coke.

Hampton Roads Market Quiet

Dumpings at Hampton Roads last week increased over those of the previous week, while prices declined slightly. There was some demand for Kanawha gas coals from Canada, but the tonnage was comparatively small. Inquiries from South America were quite numerous, it being stated that British coal agencies not being able to hold this tonnage, a large part of it had been diverted to this port. With the coming of cool weather a better market is looked for.

The large stocks on hand are not causing as much uneasiness among the shippers, as the light demand.

News Items From Field and Trade

ALABAMA

The Federal American Engineering societies have appointed Erskine Ramsay, vice-president of the Pratt Consolidated Coal Co. as chairman of the committee that will make a study of the coal storage problem in Alabama. Other members of the committee are F. B. Keiser, Robert Hamilton, S. L. Morrow, E. Stauverman, E. H. Pierce and T. H. Aldrich. Questionnaires will be sent out to consumers and producers and an effort will be made to compile the data necessary for an early report.

William Lacey, superintendent of mines for the Woodward Iron Co. has tendered his resignation and accepted an appointment in like capacity with the DeBardeleben Coal Corporation. Mr. Lacey for the past two years has been in charge of both the coal and ore mines of the Woodward Company. W. M. Johnson will succeed Mr. Lacey.

The largest class in the history of the mining industry in Alabama took the recent mid-year examination before the state board of examiners. There were 119 applicants for certificates of competency as mine foremen and fire bosses, out of which a total of eighty were successful in passing the examination. Sixty-four received certificates as first class mine foremen, seven as second class, and nine were successful in obtaining certificates as fire boss.

The Riley & Kincaid Coal Co., with capital stock of \$5,000, and the Morrison Coal Company, with \$2,000 capital, were incorporated recently in Jefferson county.

COLORADO

The American Continuous Retort Co. of Denver has bought a quarter-section of coal land from U. H. Clark of Thompsons located near that place. The price was \$15,000. The Colorado concern will use the output for its own use. The mine has been operated for several years and the coal disposed of in Grand County.

Papers have been drawn for a lease of 6,100 acres of Colorado coal lands to the Pacific Steel Co. of Los Angeles. State house officials reported that the lease would be signed shortly, thereby giving a clear road for extensive exploitation of what is known as the Fort Lewis mesa in La Plata County near Durango where coal lands are located.

A representative of the company has appeared before the state land board and also the state board of agriculture. The latter has control of the mesa. He told the board that 1,000 tons of coal daily could be taken from the field. The Pacific Steel company says it is prepared to spend \$2,000,000 in the development of the new coal fields. The plan is to build a railroad into the mesa country—possibly a branch of the Santa Fe.

ILLINOIS

The Cosgrove-Meehan Coal Co. of Illinois, at Marion, has increased its capital from \$1,500,000 to \$1,800,000.

The McLean County Coal Company, Bloomington, has resumed operations, work being done on the second vein. The third vein was abandoned several years ago. The company will operate the mine after September 1 at full capacity.

A new 1,000-foot switch is being constructed at the Benton mine of the Franklin County Mining Co. to connect that mine with the Chicago & Eastern Illinois railroad thus giving the mine a second rail outlet. James Seymour is general manager.

Mine No. 5 of the Southern Gem Coal Corporation located at Pinckneyville, will be reopened at once. The shaft was closed sometime ago when the men called a strike over the hoisting engineer, whose discharge the miners demanded. The company refused. The company operates two mines at Pinckneyville, Nos. 5 and 6.

The Kolb Coal Company, one of the leading companies in the Fifth & Ninth Districts of Illinois has just been acquired by Louis C. Emmons, of Philadelphia, who is also President of the Emmons Coal Mining Company, operating mines in Pennsylvania and West Virginia. Mr. Emmons becomes President succeeding C. C. Field. H. B.

Wessel has been promoted from Sales Manager to the office of Vice President, in charge of both the St. Louis office and the company's five mines.

The East Side Coal Co., of Freeburg, a new concern, announces that it is about ready to open its new mine at that place. The following are members of the new concern; Erwin and Edwin Koesterer, Jake and Edward Martin and Leo Funk. The shaft has been completed at a depth of 160 feet and development work is under way. The coal is of excellent quality and averages 6 feet, 8 inches in thickness.

INDIANA

The Joy Machine Co., a Delaware corporation, has qualified to do business in Indiana with a capital of \$9,000. They will manufacture coal digging and loading machines. Van Nolan, of Evansville, is their agent.

The Keystone Coal Mining Co. has been incorporated with a capital of \$50,000. They will mine coal, clay and minerals with offices at Linton, Ind. W. T. Suthard, Squire Walters, Andrew Humphreys, C. H. Gregory and J. C. Fritz are directors of the company.

John T. Reed, receiver for the Calcora Coal Co., Terre Haute, has received permission from the court to sell or lease the property of the company clear of all encumbrance. The petition showed that the property of the company is of no value so long as it is encumbered and further alleged that all creditors of the company are willing that the property should be sold in this way. The property is said to be worth in the neighborhood of \$40,000. The receiver's report shows a total disbursement of \$6,781.08.

A survey of the amount of coal in storage in Indianapolis is being made by a committee composed of T. A. Wynne, of the Indianapolis Light and Heat Co.; Carl Fletcher, of the Knox Coal Mining Co.; M. K. Foxworthy, of the Merchants' Heat and Light Co.; Earl Carter, of the Public Service Commission, and R. H. Bennett, of the Industrial Sales Co., on behalf of the Federated American Engineering Societies. Every industry that consumes coal is included in the survey, the committee ascertaining how much coal is in storage now and how much the concern can store against emergencies.

KENTUCKY

Rainbow Coal Co. has been incorporated in Louisville, with a capital stock of \$25,000, by C. D. Salyers, F. S. Salyers and others.

The Kentucky gubernatorial election this fall can't hurt the coal trade of the state materially, as candidates nominated by both parties are favorable to the coal trade. Alvin W. Barkley, Democratic nominee, from Paducah, Ky., who was arguing for a coal tonnage tax, higher mine property tax, lease tax, etc., was defeated on Aug. 4, by J. C. Cantrill, of Georgetown, a man favorable to the coal and racing interests of the state. Charles I. Dawson, of Barbourville, Republican candidate, comes from the coal country, and is favorable to the coal interests. Nominations have been largely argued as if coal and racing were the two big issues. Regardless of which party receives the election, the feeling in the coal trade is that the next Governor will not be a man who is gunning the coal trade.

MASSACHUSETTS

The committee of Western Massachusetts engineers appointed to study the coal situation as a part of a national investigation of coal storage, which the Federated American Engineering societies have undertaken, in co-operation with the United States Coal commission and the United States department of commerce, will be headed by Robert E. Newcomb of Worthington Pump & Machinery Company, Holyoke. Other members are A. B. Reynders, Westinghouse Electric and Manufacturing Company, Springfield; Herbert A. Moody, Turners Falls Power and Electric Company, Turner Falls; John M. Newton,

Roland T. Oakes Company, Holyoke; Harley W. Morrill, Ludlow Manufacturing Associates, Ludlow; Lorenzo J. Scott, United Electric Light Company, Springfield.

MINNESOTA

W. H. Hoyt, chief engineer of the D. M. & H. Ry., has been chosen to head the Duluth committee by the Federated American Engineering Societies to study the coal situation. Other members of the committee are W. H. Hawley, G. W. Andrews, W. H. Cargo, C. A. Graves, C. J. Enger, John A. Jess, C. D. Christie and Thomas D. Hodge.

MISSOURI

A 38-in. vein of coal has been struck on the J. W. Barton farm, at Amoret, seventy miles south of Kansas City on the Kansas City Southern Ry., at a depth of 102 feet.

Bids for the St. Louis city contract for approximately 80,000 tons of Standard screenings, which last year was held by the Egyptian Coal & Mining Co., of St. Louis, were recently opened. The Meteor Coal Co., of St. Louis, was low at \$1.30. The West Virginia Coal Co. came next with a price of \$1.37.

The Kolb Coal Co. of St. Louis, sold under the hammer recently and bought in by the First National Bank of St. Louis representing Philadelphia capitalists who were the bondholders, has been reorganized with Louis C. Emmons, president, of Philadelphia, who is also connected with the E. C. Emmons Coal Co., H. B. Wessels of St. Louis, vice-president and general manager, and Charles Morris, secretary and treasurer.

The property of the Morton Coal Co., operators of Mine No. 24, near Novinger, was sold recently by Sheriff Waddill, of Adair County. The leases were obtained by J. J. McGraw.

MONTANA

It is estimated that the new Rosebud coal field to be opened by the Northern Pacific Ry. in Rosebud County bears a vein 28 ft. thick and contains an estimated total of 11,550,000,000 tons. The road told the I. C. C. before the commission granted permission for 31 miles of railroad to tap the region, that about 1,400,000 tons will be mined annually for the road's use, saving possibly \$1,000,000 a year over coal of admittedly better quality which the line has been buying for its lines between Mandan, N. D., and Missoula, Mont. No commercial development in the field is planned yet, but the railroad believes that some revenue coal eventually will be produced.

NEW YORK

It has been announced that Frederick McCann, President of McCann-Camp Company of New York, with offices at Scranton, Pa., DuBois, Pa., and Morgantown, W. Va., has disposed of his interest in Producers Coal & Coke Company of Johnstown, Pa., and is now concentrating his efforts entirely to McCann-Camp Company.

The Board of Directors of the Coal & Iron National Bank, New York City, appointed Harold C. Knapp of the Irving National Bank Trust Officer. Mr. Knapp will take up his new duties Sept. 1st, succeeding Arthur A. G. Luders who has resigned. At the same time John R. Voorhis, Jr., was appointed Assistant Cashier, the appointment to take effect immediately.

Pattison & Bowns, of New York City, announce that they have negotiated a contract for the purchase for a period of years of the entire tonnage of the famous Pittston coal of the Pennsylvania Coal Company, The Hillside Coal & Iron Company and associated companies, to be sold commercially in Canada and the territory east of the western boundary of Pennsylvania, to take effect as of April 1, 1924. They are negotiating with Williams & Peters to take over their sales contract which expires as of April 1, 1924, and upon the completion of these negotiations, an announcement will be made of a definite date when this arrangement will be effective.

OHIO

H. C. Cain, purchasing agent for Columbus, has awarded the contract for 22,650 tons of nut, pea and slack coal for various city departments at an average cost at the mines of \$1.30 per ton. The Jay Miller Coal Co. will furnish 12,500 tons for the municipal light plant at \$1.40; the Williams S. Harmon Coal Co. will furnish 6,800 tons at the water works pumping station at \$1.24, and the Hisylvania Coal Co. will furnish 3,350 tons for the garbage reduction plant at \$1.25.

The Clear Creek Coal Company has been placed in voluntary bankruptcy. Its assets are in the neighborhood of \$2,500 and liabilities about \$6,000.

The H. Tahl Co., has been chartered with a capital of \$5,000 to deal in coal, among other things. Incorporators are: Rebecca Tahl, Hyman Tahl, S. Tahl, E. R. Shawman and R. E. Marrs.

Development of about 700 acres of coal land in Pultney and Pease townships, Belmont county, Ohio, is contemplated by Fether Hamilton, following the acquisition of the acreage. Coal in this acreage is in the Pittsburg No. 8-A vein. The 700 acres acquired involved a consideration of about \$25,000, it is stated.

The Swaywood Coal Company has been incorporated under the Ohio laws with offices in Cincinnati. Those back of the venture are: G. W. Swain and Miss G. R. Wood, who were employees of the Main Island Creek Coal Company when that branch office was directed by E. J. Frechtling.

Deeds have been recorded at St. Clairsville transferring 800 acres of Pittsburg or No. 8-A coal in Pultney township, Belmont Co. to David Hamilton of Greensburg, Pa. Although the price is given in the deed as \$10 for the entire tract, the revenue stamps on the document indicate the price was \$60,000 or an average of \$75 an acre. This is believed to be the largest price ever paid in the Eastern Ohio field for the thinner vein.

Southern Ohio Coal Exchange reports that during the week ended July 28 there were 153,717 tons produced in the district out of a full time capacity of 722,915 tons from 443 mines reporting. Of the shortage of 569,198 tons, car shortage caused a loss of 9,860 tons; labor shortage a loss of 10,408 tons; strikes, 14,145 tons; mine disability, 6,378 tons, and no market, 528,407 tons. During the same week the eastern Ohio field loaded 11,182 cars out of a total of 15,792 cars ordered.

The Raven Coal Mining Co., of Steubenville, has been incorporated with a capital stock of \$300,000 by Lee Van Tilburg, John H. Peterson, R. D. Stone, E. M. Morrow and M. H. Francis.

The Willard Coal Co., of Cleveland, has sold to the Brocalisa Chemical Co. a tract of coal land containing 1,000 acres near Racine which will be developed soon by the opening of several mines. The deal involved about \$1,000,000.

The Big Mountain Coal Co., of Columbus, has been made exclusive sales agents for the Vulcan Coal Co., with headquarters in Steubenville and three mines at Pomeroy. The company operates a large mine with a capacity of 1,200 tons daily, where prepared sizes are made, and two smaller mines with a daily capacity of 600 tons where mine-run is produced.

PENNSYLVANIA

The Amend Coal Co., of Greensburg, has contracted with the Roberts & Schaefer Co., Chicago, for a Marcus screen to be installed in its tipple at Newcomer.

The strike in the Somerset county coal fields, which has been in effect since April, 1922, was called off Aug. 14, when John Brophy, president of district No. 2, United Mine Workers, announced that an agreement had been reached between mine officials and local union representatives, in session at Johnstown for two days. Approximately 2,500 miners were involved in the strike.

A state charter has been granted to the South Cambria Coal Company, Johnstown, with a capital of \$5,000. Incorporators: K. C. Ryan and William Ryan, Johnstown, and George S. Vickrey, Salix. A charter was also issued to the Breck Fuel Company, Pittsburgh, with a capital of \$25,000; incorporators: George D. Breck, Jr., Pittsburgh; Greer McIlvain and Frank G. Thompson, of Dermont.

Graham Bright, general engineer in charge of coal and metal mining department of the Westinghouse Electric & Manufacturing Co., has joined the firm of Howard N. Eavenson & Associates, mining engineers, Pittsburgh, Pa. Mr. Bright will give special attention to power house systems, power plant appraisals, transportation and transmission systems for coal and metal mines and general industrial power applications.

The Bureau of Workmen's Compensation of the State Department of Labor and Industry reports that of the total of 221 fatal accidents that occurred in the industries of Pennsylvania during July, 107 occurred in the mines. Of the other fatalities seventy-three are listed as industrial and forty-one as public service. Fifty-seven of the mine deaths occurred at the anthracite opera-

tions and fifty at the bituminous mines. Luzerne led with the greatest number of any of the coal counties, having nineteen, while Lackawanna and Schuylkill each reported thirteen deaths.

There will be offered at public sale on September 25 in Pottsville by the Lehigh Coal and Navigation Co., all its rights, title and interest in 582 acres of coal, with 104 acres of overlying surface, located partly in and eastwardly from Pottsville. The property will be sold to the highest bidder whose bid exceeds the sum of \$1,200 an acre for the entire acreage.

Since the inception of the Workmen's Compensation act, Jan. 1, 1916, there have been 19,553 fatal accident reports received by the Bureau of Workmen's Compensation; 3,850 cases of permanent disability; 1,377,303 cases of temporary disability; 15,248 agreements approved in fatal cases; 8,878 approved in permanent disability cases, and 473,480 approved in temporary disability. The total compensation paid during this period, to Aug. 1, this year, amounted to \$45,980,264. The compensation awarded for fatal accidents amounted to \$40,826,405, and of this amount \$13,776,106 has been paid, while in addition \$32,204,158 has been paid in disability compensation.

Shipments of anthracite for the month of July, as reported to the Anthracite Bureau of Information, Philadelphia, amounted to 6,260,053 gross tons as compared with 6,634,787 tons during the preceding month of June, a decrease of 374,734 tons, or 5.6 per cent. The decrease was due to Independence Day celebrations, and the fact that there were five Sundays in July, reducing the working days to twenty-five against twenty-six in June. July shipments show an increase over the same month in 1921, when 5,462,760 tons were shipped, of 797,293 tons, or 14.6 per cent. The July shipments this year were about 535,000 tons above the average shipments for that month in recent normal years. Shipments by originating carriers were as follows:

	July, 1923	June, 1923
Philadelphia & Reading	1,155,701	1,165,468
Lehigh Valley	1,124,400	1,188,497
Central Railroad of N. J.	494,254	563,304
Del., Lack., & Western	965,446	1,009,505
Delaware & Hudson ..	879,772	961,703
Pennsylvania	520,423	556,291
Erie	661,120	690,172
N. Y., Ont. & Western ..	152,543	162,353
Lehigh & New England	306,394	337,494
	6,260,053	6,634,787

The Workmen's Compensation Board has sustained the appeal of the Philadelphia & Reading Coal and Iron Co. in the case of Mrs. Anna Smith, Mt. Carmel. The woman had been granted compensation by the referee for the death of her husband, William E. Smith, but the Board in an opinion writ-

ten by Paul W. Houck, Commissioner, and concurred in by Chairman Walnut and Commissioner Morrison, reaches the conclusion that the referee's findings in the case are not supported by competent proof and that his award cannot be sustained. The referee found that Smith died Aug. 24, 1921, from acute myocarditis, superinduced by a strain sustained while in the course of his employment with the defendant company, Aug. 20, 1921. No person saw the accident and the only proof offered at the hearing was hearsay. The medical testimony showed that the death may have been due to numerous causes and that a sudden heavy strain might have caused it.

The referee in the case of Thomas Gowles, Wilkes-Barre, against the Hudson Coal Co., was also reversed by the Board. This case involved an appeal by the defendant from an order of the referee, granting a petition for termination of a compensation agreement. The claimant was injured, a compensation agreement was executed, and after payments had been made, the company petitioned the Board to terminate the agreement, alleging that the claimant had recovered and was able to resume his regular work on April 17, 1922. The referee found that the claimant's total disability ceased Jan. 24, 1922, but that he is still partially disabled. There was no evidence produced by either side to show the extent of the partial disability. The referee in his order directed that payments of compensation for total disability cease and that a supplemental agreement be executed providing for the payment of partial disability compensation. The company's appeal was based on the ground that the order is impossible of performance because the claimant did not show the extent of his partial disability and the referee did not find it. This, it was claimed, would prevent the fixing of terms of any supplemental agreement. Moreover, the defendant company contended that the claimant has fully recovered.

The fourth annual first-aid meet of the Bertha-Consumers Company, Pittsburgh, which was held Aug. 11, was won for the third consecutive time by the team representing the Johnetta mine at Johnetta. The Johnetta score was 94.66%, closely followed by the Jean Mine of Dinsmore, with a score of 93.50%. As a result of its victory, the Johnetta team will represent the Bertha-Consumers Company at the International First-Aid and Mine Rescue Contest which will be held August 27th to 29th at Salt Lake City, Utah. The Johnetta team in 1921 won the Pennsylvania State championship and tied for fourth place in a field of 68 entries at the International meet held in St. Louis that year. The Bertha-Consumers Company has at its twenty mines in Pennsylvania, Ohio, West Virginia and Kentucky 287 men trained in first-aid and 106 men in mine rescue. Teams composed of picked members from nine of the twenty mines competed in this first aid meet which was staged in co-operation with the U. S.

CHIEF JUDGES AT THE BERTHA-CONSUMERS MEET
Left to Right—D. J. Parker, Dr. A. F. Knoefel, J. A. Cartel

Bureau of Mines. The members of the winning team are: T. L. Holsing, Captain; Robert Bainbridge, Patient, Edward Fitzmaurice, M. J. Fitzmaurice, David McKelvey and Charles Peterson. R. L. Barnaby is superintendent of Johnetta Mine.

TENNESSEE

Southland Coal Co. has been incorporated in Memphis, with a capital of \$30,000, by J. M. Green, T. D. Hunt and Geo. Coatway.

Alvin Owens, mine foreman of the Highland Coal & Lumber Co., has been elected president of Chapter No. 60 of the Joseph A. Holmes Safety Association, just organized at Davidson. W. C. Reeves is secretary.

The suit entered by the Government against the Nashville Industrial Corporation in the Federal Court of the Middle District of Tennessee asking that the contract held by that corporation with the Government covering the sale of the Old Hickory Plant be rescinded, will in no way interfere with the plans of industrialization of Old Hickory, as it is the desire of both the Government, as expressed by First Assistant Attorney General A. T. Seymour, and the Nashville Industrial Corporation that an industrial city be made of this war expenditure. As charges have been made that there was fraud in the sale of the property, it was felt by both litigants that the question should be definitely settled in order that industrialization might proceed with absolute safety to industries intending to locate at this point.

TEXAS

Saline Coal Co. has been incorporated in Grand Saline, with a capital of \$90,000, by J. S. Brown, J. F. Bailey and J. F. O'Neill. The latter is president and general manager. The company will develop 303 acres and operations will start within ninety days.

UTAH

The United States land office at Salt Lake City has been directed by the Secretary of the Interior to offer for lease a tract of coal land in Utah containing 760 acres. The land is in Emery county, occupying the plateau rim on the West side of Huntington Canon and is in greater part underlain by the coal measures of the Mesa Verde formation.

C. H. Hotchkiss, Utah Fuel Co., has been chosen chairman of the coal committee of the new shippers board, formed at the state capitol with Thomas E. McKay, president of the Public Utilities Commission, as president. The board will study production, markets, distribution and trade channels of the commodities local to each district, with a view to effecting improvements in trade practices when related to transportation, and promoting a more even distribution of commodities where practicable. It is hoped that the board will ensure proper car service and that Utah will get her pro rata share of empties.

WEST VIRGINIA

Probably the first coal company in the country to be named for the new president is the Coolidge Coal Co., launched by Fairmont people including Ernest Hutton and W. Nelson Beale of the Hutton-Beale Coal company, Benjamin Franklin Evans, W. D. Evans and A. J. Colborn. The company is capitalized at \$50,000.

The Shenandoah Coal company has been organized with a view to operating in the Logan county field, with a capital stock of \$75,000. Offices of the company are to be at Logan, W. Va. Those interested in the new concern include Paul Barrett, William Frank, Rex Jones, Fred Haislip and R. S. Burton, all of Logan.

The Goodman Manufacturing Co., of Chicago, manufacturers of "Goodman" coal mining machines and electric mine locomotives, have opened a repair and supply department at Huntington, occupying a building designed and erected expressly for their use.

As a result of a survey made by E. & O. Ry. officials of the number of cars to which mines on its various divisions in West Virginia and other coal producing sections are entitled, mine ratings for the various mines have been revised. In many instances the revision has resulted in a reduction of the allotment for mines on some divisions. The new allotment became effective July 16.

A. Spates Brady, president of the Brady and other coal companies of Elkins, escaped

with light injuries in an automobile collision on the Connellsville road, near Uniontown on Aug. 3, when another car in attempting to regain the road, rammed Mr. Brady's car, drove it against a telephone pole and ripped off both the rear wheels.

F. R. Lyon, vice-president of the Consolidation Coal Co., returned on Aug. 1 from a trip abroad.

R. E. Salvati, recently appointed superintendent of mines 15, 16, 17, 18 and 19 of the Island Creek Coal Co., at Holden, was less than a year ago a laborer for the company, having this advantage, however, that he was a graduate of the West Virginia University. He is only 24 years old. Salvati was promoted from laborer, made assistant mine foreman, later appointed assistant superintendent and finally made superintendent of the group of mines already mentioned.

The Dwyer Coal Co., with operations near Coalburg, is opening a new mine near Chapmansville, where it recently acquired about 1,000 acres of coal of excellent quality. The company is building a modern colliery and also attractive quarters for its employees. John G. Dwyer will have charge of the mines.

A new mine is being opened by the Deep Run Co., of Cumberland, Md., in the Elk Garden district of West Virginia, at a cost of approximately \$300,000. Three mines are already in operation. The new mine at the beginning of operations will have an output of about 500 cars a day and that output will be increased as the mine is further developed. The company produces about 300 tons a day at its other mines. All the plants of the company are operated on an open shop basis. C. H. Lantz, of Piedmont, W. Va., is president, and W. R. Nethken, of Cumberland, Md., vice-president of the company.

The law enacted at the last session of the West Virginia legislature, in April, creating the West Virginia School of Mines is now in effect. The new school when established is to contain departments of mining engineering, mining extension, mining geology and chemical engineering, as well as the mining experiment station already authorized by the mining laws of West Virginia. It is to be organized with a suitable staff of instructors and shall have the same rank and standing as the colleges of engineering, law, agriculture, medicine and arts and sciences. The cost of establishing and maintaining the West Virginia School of Mines shall be paid out of an appropriation hereafter to be made by the legislature for such purpose. The governor has been authorized to appoint a committee of five to ascertain where the school may best serve the mining interests of the state and avoid unnecessary duplication of work. The commission is to be composed of one member of the Senate, one member of the House of Delegates and three prominent coal mining men, who shall serve without pay, and is to report whether in its opinion the school shall be carried on as an independent institution or in connection with one or more of the present existing educational institutions of the state. At the time the bill was introduced a movement was launched in Fayette county to have the new school of mines established at Montgomery. It is probable that it will either be established there or in connection with the State University at Morgantown.

Coal Tonnage handled by the Chesapeake & Ohio during July was heavier than at any time in the history of the road, no less than 3,517,000 tons of coal being handled in that period. The nearest approach to that figure was reached in June, 1922, when a total of 3,300,000 tons of coal were transported. Record-breaking loading in July was made possible by an excellent car supply. Increased loading has also been made possible owing to the steps taken to increase transportation facilities in general for coal.

Of 15 teams competing for first honors in the annual first aid and mine rescue contests at Huntington, Aug. 11, two teams representing the Davis Coal & Coke Company carried off first honors. Team No. 6, representing the Davis operation of the company won first place, and team No. 2 representing the Thomas operation, won second honors. Team No. 8 representing the New River Coal Company, of Beckley, took third place. The Davis team won the cash prize of \$150, the State Department of Mines Loving Cup, six Wolf aluminum safety lamps suitably engraved, and will represent West Virginia at the national first aid meet to be held at St. Louis in September. To the Thomas team was awarded a cash prize of \$90 and six Wolf aluminum safety lamps. The contest was conducted by the West Virginia Department of Mines in co-operation with the

Huntington Chamber of Commerce and under the inspection of the United States Bureau of Mines.

WASHINGTON

The Morton Coal & Coke Co. has purchased the J. H. Bell farm near Morton and has begun shipments of coal over the new suspension bridge and the C. M. & St. P. Ry. to Seattle and the Coast.

WASHINGTON, D. C.

The Government Relations Committee of the National Coal Association for the coming year is as follows: Walter Barnum, treasurer, Pacific Coast Co., New York; J. G. Bradley, president, Elk River Coal & Lumber Co., Dundon, W. Va.; W. H. Cunningham (chairman), president, Cunningham, Miller & Enslow, Huntington, W. Va.; E. L. Douglass, vice-president, First Creek Mining Co., Cincinnati; Michael Gallagher, general manager, M. A. Hanna Co., Cleveland; W. H. Huff, president, Victor-American Fuel Co., Denver; S. Pemberton Hutchinson, president, Westmoreland Coal Co., Philadelphia; Sidney J. Jennings, president, U. S. Smelting, Refining & Mining Co., New York; A. J. Maloney, vice-president, Chicago, Wilmington & Franklin Coal Co., Chicago; Isaac T. Mann, president, Pocahontas Fuel Co., Washington, D. C.; W. F. Megeath, president, Roundup Coal Mining Co., Omaha, Neb.; A. M. Ogle, president, Vandalia Coal Co., Terre Haute; J. G. Puterbaugh, president, McAlester Fuel Co., McAlester, Okla.; P. J. Quealy, president, Gunn-Quealy Coal Co., Kemmerer, Wyo.; Frank D. Rash, president, St. Bernard Mining Co., Earlington, Ky.; H. B. Sajkeld, vice-president, Carnegie Coal Co., Pittsburgh; H. N. Taylor, president, U. S. Distributing Corporation, New York; George T. Watson, Consolidation Coal Co., Fairmont, W. Va., and S. L. Yerkes, vice-president, Grider Coal Sales Agency, Birmingham, Ala.

CANADA

The Hunt Coal Co., Ltd., of London, Ont., has been incorporated with \$100,000 capital by Charles R. Hunt, John I. A. Hunt, James D. Hunt and others.

Quinle Coal & Towage, Ltd., of Toronto, has been incorporated with \$50,000 capital by Frank W. Richardson, Lancing B. Campbell, Wm. C. H. Swinburne and others.

J. A. Ellis vice-chairman of the Ontario Municipal and Ry. Board, is being retained by the new Ferguson Government in Ontario in his capacity as Fuel Controller. He states that a reasonable supply of anthracite is coming into Ontario but not enough to meet the demand and urges consumers to buy liberally this summer.

A Pennsylvania syndicate which has been exploring for coal near Skidegate, Queen Charlotte Islands for more than a year, has traced a three-foot seam for more than two miles. It is now proposed to sink two shafts on the seam, which is almost vertical. The syndicate is building a wharf at Kagan Bay, on which to land the necessary equipment for sinking and later it will be used for shipping coal. The coal is said to be a good grade of semi-anthracite.

The British Empire Steel Corporation reports that its coal production for July amounted to 136,894 tons, as compared with 423,493 tons for July, 1922, the reduction in output being due to the strike. The production of coal for the seven months ending July 31st amounted to 2,959,426 tons, as compared with 2,185,816 tons for the corresponding months of 1922.

It has been suggested to the Canadian coal trade, that Welsh anthracite coal be shipped to Canada in exchange for pit props. Ships carrying the coal to Canada could load pit props for the return journey thus cutting down carrying charges. Wales produces various grades of anthracite and Canada received some low quality last year but shippers of Welsh coal understand now that only the best quality must be shipped to Canada.

Premier Charles A. Dunning, of Saskatchewan, is advocating protection of the Western Canada coal industry against competition from the United States in the same way as the manufacturing industries of Canada are protected.

Unexpected progress is being made in the campaign for the use of coke as a substitute fuel in Canada, according to the statement issued by Charles Camsell, Deputy Minister of Mines following a meeting of the Dominion Fuel Board, at Ottawa. The board has been endeavoring to prevail upon the larger cities such as Toronto, Montreal and Quebec to establish plants for the manufacture of coke from soft coal and the utilization of by-products.

Association Activities

COLUMBUS COAL BUREAU

The organization of the **Columbus Coal Bureau**, Columbus, Ohio, composed of producers and distributors, was completed Aug. 6, when the following officers were elected: President, John M. Taylor; vice-president, Jay W. Miller, and secretary-treasurer Thomas C. Collins. It is the purpose to have the prominent men in the coal industry address the members of the Bureau on industrial and economic conditions.

Obituary

C. R. Wilson, president of the International Fuel and Iron Co. of Pittsburgh, died July 27. He was 39 years old, and was a son of the late J. T. Wilson, who at the time of his death, was president of the National Fuel Co.

John Hoyes McGowan, president of the John H. McGowan Co., pump manufacturers of Cincinnati, Ohio, died Aug. 6. He was 93 years old, and had been president of the McGowan company since 1852.

Willis F. McCook, president of the Pittsburgh Steel Co., died on Aug. 5, aged 73 years. He was senior member of the law firm of McCook & Jarrett. Early in his career Mr. McCook was the legal representative of Henry C. Frick and T. M. Carnegie.

David Pursglove, assistant general manager of the Cleveland-Morgantown Coal Company, at Scott's Run died Aug. 11. Mr. Pursglove's death was due to apoplexy, a stroke of which he suffered while engaged in writing a letter to his nephew, Joseph Pursglove of Cleveland, president of the Pursglove Coal Mining Company, as he sat at his desk in the office of the company on Scott's Run. Mr. Pursglove was 68 years of age. He was a native of Ripley, England where at an early age he acquired a knowledge of mining and of English coal mines.

Publications Received

Grates, Stokers, Steam Blowers—McClave-Brooks Co., Scranton, Pa. Catalogue 8 x 11, describing the McClave mechanical stokers for all grades of bituminous and lignite fuels. Illustrated.

The Motor Gasoline Surveys of 1920 and 1921. (Sequel to Bull. 191) by N. A. C. Smith, Bureau of Mines, Washington, D. C. Technical paper 328. Pp. 41; 6 x 9 in.; tables. Includes complete details of analyses of each sample of gasoline collected in four surveys made in 1920 and 1921, with tables and charts showing comparative results and a brief discussion of the variations in quality developed by the surveys.

Mine Rescue Standards (A. Tentative Study). Prepared by a committee appointed at the International Mine Rescue Standardization Conference, Sept., 1921. Bureau of Mines, Washington, D. C. Technical paper 334. Pp. 43; 6 x 9 in.

Comparative Tests of By-Product Coke and Other Fuels for House-Heating Boilers, by Henry Kreisinger, John Blizzard, H. W. Jarrett and J. J. McKitterick, Bureau of Mines, Washington, D. C. Technical paper 315. Pp. 21; 6 x 9 in.; illustrated. Results of tests made to compare by-product coke, bituminous coal and anthracite as fuels for small boilers are given.

Trade Literature

Short Cuts to Power Transmission. Flexible Steel Lacing Co., Chicago, Ill. Pp. 72; 4 x 5 in.; illustrated. This handy little book should prove useful to belt users.

New Reinforced Concrete Coaling Plants. Roberts & Schaefer Co., Chicago, Ill. Bulletin No. 52. Pp. 10; 8 x 11 in.; illustrated. Shows views of coaling plants erected for different railroads, also patented "calibrated" measuring feeder, Simplex loader, by the use of which the 4-column bucket tower is eliminated and undercut lever type coaling gates with swivel aprons.

Chain-Drive Data. Diamond Chain & Mfg. Co., Indianapolis, Ind. Pp. 14; 4 x 7 in.; illustrated. This loose-leaf booklet contains charts and information on the design and application of roller-chain drives.

A description of the new standard sprocket tooth form approved by the A. S. M. E. is included, as is also a chart which will prove useful in selecting correct chains and sprockets for transmission purposes.

The Lilly Hoist Controller, Models C and D. Duro Metal Products Co., Chicago, Ill. Pp. 18; 8 x 11 in.; illustrated. Contains instructions for installing and adjusting on steam, air and electric hoists.

The Lilly Hoist Controller, Models C and D (Gravity-Electric). Duro Metal Products Co., Chicago, Ill. Pp. 22; 8 x 11 in.; illustrated. Auxiliary equipment for steam, air and electric mine hoists are described. The book also contains a treatise on causes of accidents.

Stow Mfg. Co. of Binghamton, N. Y., has just issued a four-page folder describing and illustrating its motor-driven grinders, buffers, drill and die-sinking tools.

Erie Upkeep Cost Record Book Erie Steam Shovel Co., Erie, Pa. Pp. 71; 5 x 8 in.; illustrated. Contains maintenance costs covering actual repairs and consumed parts of steam shovels, gathered from an upkeep cost contest.

The Cox Stoker. Combustion Engineering Corporation, New York City, N. Y. Bulletin CB2. Pp. 7; 8 x 11 in.; illustrated. The burning of small-sized anthracite coals and coke breeze by the Cox stoker is described, and evaporative tests of the stoker over a wide range of capacities are included.

International Painting Equipment. International Engineering Corporation, Malden, Mass. Pp. 15; 8 x 11 in.; illustrated. Among the apparatus described are aerograph sprayers, aerograph control, exhaust hoods, exhaust fans, turntables, electric heaters, reflectors, portable compressors and automatic painting machines.

Traffic News

The railroads set a new record during the last half of July in repairing and turning out 22,200 locomotives. On August 1 there were 11,555 engines in need of repairs, but the carriers had 52,385 serviceable locomotives and 2,550 locomotives in good repair and in storage, awaiting the heavy fall movement of traffic.

The Coal and Coke Committee, Trunk Line Territory, announce a hearing at 143 Liberty Street, New York, on Aug. 23, relative to an advance in rates on anthracite coal, buckwheat No. 1 and smaller sizes, from mines on Delaware and Hudson Rys. to stations on New York, Ontario and Western Ry., Rockdale, N. Y., to Edmeston, N. Y., incl. The reason for the proposal is to make rates same as for one line haul.

During the first fifteen days of July the railroads placed in service 8,217 new freight cars which brought the total number of new freight cars installed since January 1, up to 87,457. They also installed from July 1 to July 15, 102 new locomotives, making a total of 2,100 that have been placed in service since January 1. Of the new freight cars placed in service, box cars numbered 35,833; coal cars, 36,048, and refrigerator cars, 10,224, which includes 6,149 placed in service by railroad-owned private refrigerator companies. Railroads on July 15 had on order 94,202 freight cars, of which 41,726 were box cars, 37,135 were coal cars and 10,703 were refrigerator cars. They also had on order on the same day 1,848 new locomotives. Deliveries of new freight cars and locomotives are being made daily.

W. J. Smith, of Omaha, Neb., has been appointed district manager of the Car Service Division of the American Railway Association at Omaha, effective August 15. He has been general agent in Omaha for the Chicago and Northwestern Railroad. The territory making up the Omaha district includes the terminals at Council Bluffs and Sioux City, Iowa; the entire states of Nebraska, Wyoming, Colorado and Utah and the state of Idaho exclusive of the Panhandle.

In recognition of his service to the road, the management of the Chesapeake & Ohio has promoted **J. W. Davin**, chairman of the car allotment commission of the Chesapeake & Ohio Ry. for the last two years, to be assistant superintendent of transportation. The appointment, made by A. T. Lowmaster, superintendent of transportation, was with the approval of General Manager J. B. Parrish. Mr. Davin will have his headquarters at Huntington. Announcement has also been made of the appointment of **Ira F. Davis** as chairman of the allotment commission to succeed Mr. Davin. Mr. Davis has been the general manager of the Chesapeake & Ohio fuel mine operation. **H. B. Husband** has been

appointed as general manager of fuel mine operations, succeeding Mr. Davis.

During the last half of July, 9,493 new freight cars were delivered to the railroads and placed in service, which brought the total number of new freight cars placed in service from Jan. 1 to Aug. 1 up to 96,950, according to the Car Service Division of the American Railway Association. Of the new freight cars placed in service during the last half of July, box cars numbered 3,595; coal cars, 3,133; refrigerator cars, including those delivered to railroad-owned private refrigerator companies, 1,846, and stock cars, 226. The railroads had on Aug. 1, this year, 86,716 new freight cars on order with deliveries being made constantly. Of the total number on order, box cars numbered 38,689; coal cars, 34,457; refrigerator cars, 9,299, and stock cars, 2,214. They also had on order on Aug. 1 a total of 1,772 new locomotives.

Class 1 railroads of the United States, in June earned an annual rate of return of 5.47 per cent on their tentative valuation as fixed by the Interstate Commerce Commission for rate making purposes, including additions and betterments up to Jan. 1, 1923. This rate represented a net operating income for the month of \$87,742,000. In the Eastern district the rate earned was 6.39 per cent; the Southern district, 5.78 per cent, and the Western district 4.20 per cent. The same carriers in June last year earned a net operating income of \$76,271,000 which was at the annual rate of return of 4.86 per cent. In May this year the rate was 6.33 per cent. Thirty one Class 1 railroads in June operated at a loss, of which nine were in the Eastern, two in the Southern and twenty in the Western district. Operating revenues of the carriers in June totaled \$541,163,000 an increase of \$69,129,000 or 14.6 per cent over the same month last year, while their operating expenses amounted to \$416,908,000, an increase of \$43,629,267 or 11.7 per cent over June one year ago.

For the first six months this year the net operating income of the Class 1 railroads represented an annual rate of return of 5.64 per cent on their tentative valuation, amounting to \$443,912,000, compared with \$349,069,000 or 4.53 per cent for the same period in 1922 or an increase of \$94,842,000 over the first half of last year. In the Eastern district for the six months period it was 6.59 per cent or \$240,731,000; Southern district, 6.64 per cent or \$69,916,000; and the Western district, 4.20 per cent, or \$133,265,000. The Interstate Commerce Commission has not tabulated the tentative valuation of the carriers according to the various subdistricts but compilations show the annual rate of return for the first six months this year based on their property investment accounts to have been 4.94 per cent. From Sept. 1, 1920 to July 1, 1923, during which period of thirty-four months the railroads have been operating without any guarantee whatever, the average annual rate of return of the carriers on their tentative valuation has been only 3.94 per cent. For the Eastern district it was 4.02 per cent; for the Southern district, 4.05 per cent, and for the Western district 3.82 per cent.

Coming Meetings

Rocky Mountain Coal Mining Institute will hold its summer meeting Aug. 27 to 29 at Salt Lake City, Utah, in conjunction with the **International Safety and First-Aid Meet.** Secretary, Benedict Shubart, Denver.

New York State Coal Merchants' Association will hold its annual convention on Sept. 10-12 at Sacandaga Park, N. Y. Executive secretary, G. W. F. Woodside, 250 Arkay Building, Albany, N. Y.

Oklahoma Coal Operators' Association will hold its annual meeting Sept. 13 at McAlester, Okla. Secretary, A. C. Casev. McAlester, Okla.

The American Mining Congress will hold its twenty-sixth annual convention in conjunction with the **National Exposition of Mines and Mining Equipment**, Sept. 24-29, at the Milwaukee Auditorium, Milwaukee. Secretary, J. F. Callbreath, Washington.

National Safety Council will hold its twelfth annual safety convention at the Buffalo Statler Hotel, Buffalo, N. Y., Oct. 1-5. Secretary, W. H. Cameron, 168 No. Michigan Ave., Chicago, Ill.

The West Virginia-Kentucky Association of Mine, Mechanical and Electrical Engineers will hold its annual meeting Oct. 19-20 at Huntington, W. Va. Secretary-treasurer, Herbert Smith, Robson-Prichard Bldg., Huntington, W. Va.

Coal Mining Institute of America will hold its annual meeting Dec. 19, 20 and 21 at Pittsburgh, Pa. Secretary, H. D. Mason, Jr., Chamber of Commerce Building, Pittsburgh, Pa.

COAL AGE

The Only National Paper Devoted to Coal Mining and Coal Marketing

C. E. LESHER, *Editor*

Volume 24

NEW YORK, AUGUST 30, 1923

Number 9

Practical Moves

GOVERNOR PINCHOT stated the case of the public well in his address to the hard-coal miners and operators and the public at Harrisburg on Monday. The millions of people dependent on anthracite to keep warm next winter do not want a strike; they want and have a right to expect the contending parties to get together, even at this eleventh hour, to avert the concerted withdrawal of the mine workers next Saturday. To accomplish this he is proceeding in the right way. No published notes, just confidential conferences, sensible negotiations through a third party. If anything will save the day it is this method. Hope, seemingly scant, lies in this direction.

And while Governor Pinchot is undertaking this thankless task, co-operating we are told with the administration at Washington, the Federal Fuel Distributor is carrying out the policy of Washington of getting the country ready for a winter without more hard coal than we already have. This is practical procedure. It is common sense for the government to accept the soft-coal operators' assistance in distributing their product as a substitute and it is practical business to enlist the consumers' aid through their state officials.

The Third Line of Defense

PREVENTION is better than cure. Nevertheless it is well to cure an evil if it cannot be prevented and it is well to escape from an evil if it cannot either be prevented or cured. Thus in the matter of mine explosions; the best way is to prevent them, the next best way is to extinguish them when they occur and the third line of defense is to make a way of escape for those who, not being killed by the blast, are exposed to the noxious atmospheres it creates and so have their lives jeopardized. The last way is not a counsel of perfection, but if it were provided it would save a large percentage of the men who are caught in a mine where an explosion has occurred.

Rescue chambers have been proposed and provided. Even metal mines have them. They need to be quite airtight, for they must be used till the area in which they are placed has been explored. That may be days after the accident has occurred, and during all those hours the air is getting fouler from leakage from without and from breathing, if not combustion, within. In metal mines the use of compressed air pumped from the surface provides that the pressure will be always outward. In fact the problem is to protect the chamber from the building up of such a pressure within, as it might suddenly rupture its walls.

Many a man has found help from a handkerchief thoroughly soaked in the liquid of the container in his dinner pail. It keeps out the hydro-carbons and so may

save his life, but if, as usually happens, carbon monoxide is present, the wetted handkerchief is powerless against it. Something should be provided that will not only give the worker safety but will not interfere with his mobility. He should be able to provide for his own escape to the surface, or should exit be cut off by reason of rockfalls he should be empowered in some way to travel to some place of shelter where the air is free from contamination. We have means now of absorbing carbon monoxide and all the deadly gases that the chemistry of war and of industry have devised, and surely it should be an easy matter to make a mask which will carry a man through any mine atmosphere, however badly poisoned by deadly gases, so long as enough oxygen is present to support respiration.

Negotiation and Arbitration Rejected

THERE may or there may not be a strike in the anthracite mines next month. But if there is the basic cause will be plain. The country is fast coming to a realization that the "rule or ruin" policy of the United Mine Workers is again in force. It ruled in 1922 and it may rule again. The ruin that it can accomplish in this instance is all the more apparent as the consumers' anger rises and threatens the boycott of anthracite. To say that the union is indifferent since it covers both hard- and soft-coal fields and the loss of one would be the gain of the other is to overlook the fact that it will be the non-union fields that will furnish the bulk of the substitutes if they are needed.

The workers in the hard-coal mines are not up in arms demanding the check-off or a 20- to 30-per cent increase in wages. Nor are they keen about a strike again so soon after the last one. Some of the debts are not paid up and, furthermore, winter is coming. So finds the impartial and keen observer William Hard. Yet he finds that if a strike is called the men will loyally go out and uncomplainingly support it.

If the workers are not downtrodden, desperate and insistent on some eleven demands, why this perseverance of the union officials? Perhaps the answer in part at least is that Mr. Hard did not get the whole story. There are in sections of the anthracite region groups of malcontents. Cappellini won his way back to a job with the union by teaching and preaching discontent. He is now one of the leaders and sits in the councils of the union, a member of the scale committee which meets off and on with the operators at Atlantic City. District President Golden is by no means a conservative.

The strike of 1922 netted the hard-coal workers nothing but the satisfaction of having helped the soft-coal workers win their strike. The local union leaders from the anthracite region have told their constituents that they will not come back from Atlantic City with empty hands. It is to make good on their jobs as union offi-

cials that the country is threatened with a strike and may have one.

There is a significant sentence in the Anthracite Report of the Coal Commission. It reads: "*The union must justify itself.*" It is not headed in that direction when it refuses to negotiate with the operators and likewise refuses to submit to arbitration. It is now the same wearisome story of 1919 and of 1922. It is collective threatening and not collective bargaining. It was the ultimatum on the check-off in July; this month it is the ultimatum on the 20-30 per cent wage increase. There are those who hold that John L. Lewis is not in sympathy with these tactics this year, and that he is letting the hotheads have rope. It may be that this situation does not appeal to him, but if it is not to his liking he conceals it very well. His bellicose threat to give the operators the "trouncing" of their lives savors of that "swashbuckling" mentioned in one of the Coal Commission reports. He is leading with his customary vigor.

No, the union is not intent on justifying itself. The union leaders are intent on bringing home the bacon—justifying their jobs. What they take back must be showy—something that they have wrung from a reluctant opposition. Things like the elimination of the 12-hour day, the continuing umpire, adjustments in working conditions, minor matters corrected that would make for less friction and satisfied workmen, increases in wages that affect the individual here and there—matters that can be had by straight negotiations—are not for them.

Anthracite Production Costs

TIME alone will show how generally useful such a complete and comprehensive statement of the cost of production of anthracite as has been published by the Coal Commission will be in educating the coal-consuming public to the facts. Even though Mr. Wing and his associates have stripped the maximum of technical and professional lingo from their report to the Commission, it is quite certain that were the complete details to be put in the hands of every hard-coal consumer, 95 out of every 100 would either refuse to exert the mental effort to read and understand it or would fail to take in the significance of its findings. It was so with the report of the Federal Trade Commission in 1919 covering the same subject and prepared by the same authors.

Too many will hasten to garner from this report facts to support stands previously taken. The honest student, however, can find therein a simple and clear statement of the facts. In the first place it is clear that this Commission, like its predecessors, the Fuel Administration and the Federal Trade Commission, had no difficulty in getting the facts. There is no mention that they were unable to learn all they wanted. No "secrets" are withheld from duly constituted authorities. Big companies and little companies furnished their figures—the high-cost and the low-cost, the "rail-road" and independent producers are all included.

Nor does the Coal Commission fear that any of the figures were not correct. It has satisfied itself on that score. No revision was made of figures given in sworn reports, the experience of the Federal Trade Commission indicating that "any effect on the total figures of a few false statements was negligible so far as affecting any general results."

In its treatment of "margin," that much-abused figure that does not represent profit but which so often is taken for it, the report is fortunate. It points out that the margin between sales realization and f.o.b. mine cost is net operating income before deduction of interest and federal taxes. "It is not a good measure for arriving at the relative profits of different operations." One operator, for instance, may have a heavy investment in mining machinery per ton of output and thus show a relatively low labor cost, while another may have a higher labor cost because he has no investment in labor-saving machinery; for this reason it says, "In the case of the first operator the margin must be larger in order to give an equal rate of remuneration to the larger amount of invested capital per ton of product." In the past ten years, and notably in the past three or four, the anthracite industry has been investing heavily in new equipment in its program of electrification.

Labor costs of production are shown to have increased 145 per cent from 1913 to the first quarter of this year, and it is stated that this is not all to be accounted for by increases in wage scales, but in part by the greater amount of labor necessary, in the later years, to produce a ton of coal, due to changes in the physical conditions in the mines, such as the mining of seams which formerly were considered too poor to work, etc." It is quite true that the coal now mined is deeper and thinner than ten years ago and that the cost in man power has increased thereby. According to the figures of the Geological Survey that increase has been slight, in fact the average output per man per day has risen from 2.02 net tons in 1913 to 2.09 tons in 1921. The weighted average increase in wage scales appears to have been not less than 125 per cent, according to data previously published by the Commission. It is evident therefore that the industry must be given some credit for having improved its practices and for having very nearly maintained the efficiency in output per man per day despite the added burden imposed by more difficult mining conditions. The greater part of the increase in labor cost must therefore be attributed to the gain in rates of wages.

It is the profits of the producers, however, that interest the consumer. The Commission has not yet issued its conclusions on this matter, having yet to report on the investment on which profit is to be calculated. It is stated, however, that whereas the "margin" of the producers averaged nearly 38c. per ton of total output in the three years 1913-1915, in the six months ended last March it was, on a comparable basis, \$1.20 per ton of total output. That is, there was an increase in the ten years of some 316 per cent in the margin between mine cost and selling price.

If the dollar of today is worth in buying power but 67c. compared with that of 1913, the anthracite mine worker is getting 50 per cent more wages, on the average, in actual worth—or real wages, as the economist puts it—than he was in 1913. The producer is getting, by the same method of calculation, 112 per cent more, out of which he must pay his federal taxes. The margin of today, \$1.20, is worth 80c. in buying power, as against a margin of 38c. before the war. What is paid in federal taxes is not as yet stated, but if it is half the margin, as was estimated for 1918, then the real money left for distribution as profits is but little greater than before the war. The intervening years, 1914-1922, made a much poorer showing.

Big Franklin Refining Plant and Coke Ovens

Franklin Byproduct Plant Makes Ammonia, Motor and Pure Benzol, Toluol, Xylol and Solvent Naphtha

A Description of Those Features in the Franklin Plant Which Differ from Those Delineated in the Article on the Rosedale Refinery—Methods of Fractionating the Light Oil for Commerce

BY G. A. RICHARDSON*
Philadelphia, Pa.

AT THE Franklin plant the processes of refinement in regard to light oil go much further than at Rosedale. In fact the light oil obtained at the latter plant is sent to the Franklin plant for further treatment. In this article it will be my endeavor to pass lightly over those parts of the processes at Franklin that are similar to those at Rosedale and dwell on those having to do with the fractionating of the light oil and the making of ammonia liquor, referring briefly, however, to the more careful drying which the sulphate of ammonia receives at this plant to suit such markets as demand that the water content shall be below 0.15 per cent.

The Franklin plant is a combination of old and new construction. About 1916 the old byproduct equipment (where only a partial recovery of byproducts was effected) was torn out and a new byproduct plant constructed. The coke ovens at this place include one of the first blocks built in this country. This block was erected in 1895.

No change was made in the ovens, of which there are eleven batteries of various types, namely: Five Otto-Hoffman, two Koppers, three Cambria and one Belgian type, making a total of 492 ovens with a combined capacity of 4,500 gross tons per day. The capacity varies but is smaller than that of newer types of ovens. The coking time averages 24 hours. As at Rosedale the coal from mines located at the plant

is washed on tables of Campbell type and mixed with gas coal.

The present plant is a complete installation for the recovery of byproducts. It takes care of the entire gas output of the plant and consists of hydraulic-main circulating systems, gas washers and condensing equipment for the separation of tar and light oil from the gas, for the manufacture of sulphate of ammonia and for the obtaining of pure benzol, toluol, xylol and solvent naphtha, a boiler house and all auxiliary equipment, including ample storage capacity. This equipment is listed in detail in Table I.

The construction difficulties encountered at Rosedale

PANORAMA OF PLANT TAKEN FROM SPRAY POND

In foreground is a 40,000-cuft. gas holder. The tall towers on the left and beyond the concrete road are the scrubbers where the benzol is collected, and to the right of them are the low secondary coolers. The primary coolers are to the right of these, and still further to the right is the office and laboratory. In the rear may be seen the steel works and two blast furnaces, half hidden by the smoke from the ovens.

NOTE—This is the sixth and last of a series of articles on the mines, ovens and byproduct refineries of the Cambria Steel Co. Earlier articles appeared Aug. 31 and Sept. 7, 1922; Feb. 15, July 19 and Aug. 9, 1923.

*Midvale Steel & Ordnance Co. and Cambria Steel Co. Since this article was received these two companies have merged with the Bethlehem Steel Co.

TABLE I—BYPRODUCT AND BENZOL EQUIPMENT AT FRANKLIN PLANT

Byproduct Equipment		
Primary coolers	Ammonia stills	Decanters
Exhausters	Final coolers	Collector tanks
Gas boosters	Absorbers	Banks of cooling coils
Tar extractors	Gas holder	(2 sets)
Acid separators	Light-oil stills	Dehydrators
Saturators	Ammonia condenser	
Benzol Equipment, etc.		
Absorbers	Acid washers	Spray pond
Wash-oil cooler coils	Acid storage tanks	Spray-pond collector tank
Wash-oil collector tanks	Acid monte-jus	Light-oil storage tanks
Decanters	Acid receiver	Washed light-oil tanks
Preheaters	Acid feed tank	Residue tank
Light-oil stills	Caustic dissolvers	Benzol test tank
Vent scrubbers	Caustic feed tank	Toluol test tank
Pure-benzol condensers	Caustic receiver	Refined light-oil tanks
Pure-benzol receivers	Caustic monte-jus	Benzol free-oil tank
Pure-toluol still	Sludge disposal tank	Toluol free-oil tank
Pure-toluol condenser	Refined light-oil stills	First-runnings tank
Pure-toluol receivers	Refined light-oil condensers	Pure-benzol tanks
Solvent-naphtha still	Refined light-oil separators	Refined 90-per cent benzol tank
Solvent-naphtha condenser	Refined light-oil receivers	Motor-benzol tanks
Light-oil condensers	Pure-benzol stills	Pure-toluol tank
Light-oil separators	Solvent-naphtha separator	Solvent naphtha tanks
Light-oil receivers	Solvent naphtha receivers	

were absent at Franklin, the only problems arising being those that might be expected to occur when endeavoring to modify existing equipment in a plant which is being kept steadily in operation.

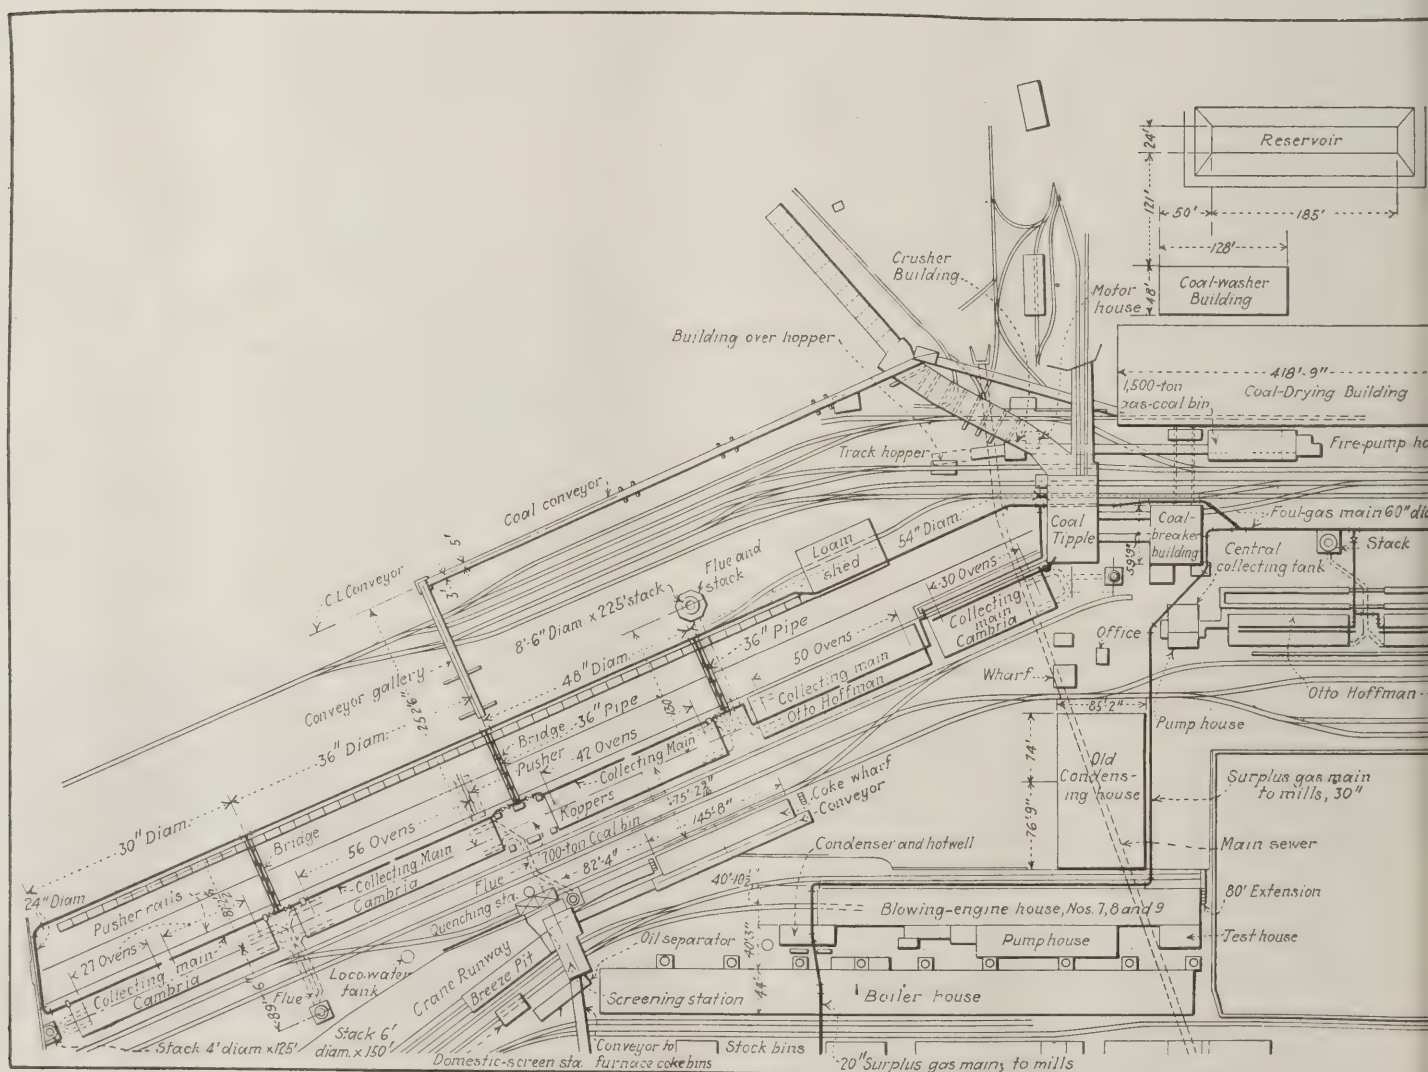

The gas from the ovens is taken off through two foul-gas mains which unite to form one 60-in. main at the three primary coolers. These coolers are somewhat

larger than those at Rosedale, but of the same type. Each cooler is 16 ft. in diameter, 45 ft. high, and has a capacity of 60,000,000 cu.ft. of gas per day. The cooling liquor is circulated through 160 banks of cooling coils, each 30 pipes high.

From the primary coolers the gas goes into the byproduct building, a steel and brick structure 360 ft. long by 83 ft. wide. Here are four turbo-exhausters, each having a capacity of 14,000 cu.ft. of gas per minute. From these the gas proceeds through (1) P. & A. tar extractors, of which there are five, and (2) Semet-Solvay saturators, of which there are an equal number. These latter take the ammonia from the gas by passing the latter through sulphuric acid, thus manufacturing sulphate of ammonia.

COOLERS AND ABSORBERS ARRANGED IN SERIES

The final coolers, which remove the naphthalene, and the absorbers or scrubbers, the function of which is to remove the light oil, are each arranged in two sets of three in series. The water from the final coolers is pumped to a spray pond for cooling and is circulated again. A small quantity of naphthalene is washed out at the final coolers, but owing to the efficient operation of the plant the yield is too small to warrant recovering it and it is wasted. The coolers are all 13 ft. in

The coal tippie shown near the center of the illustration is that of the Franklin mine. This slope has been operated for many years, and the plant for preparing the coal for use in the ovens also is by no means

new. The coal-drying building and the washer are quite similar in detail to like buildings at Rosedale; Bradford breakers, Campbell washers and large drainage pit with excavators being in use at both places.

Some of the buildings in the right foreground are parts of the steel mill, namely the blowing-engine house and the boiler house, neither of these having any part in the coke ovens or refinery. In like man-

PLAN OF THE FRANKLIN BYPRODUCT OVENS AND

diameter and 45 ft. high. The scrubbers, or absorbers, are of the same diameter as the final coolers but their height is 90 ft.

On leaving the scrubbers the fuel gas passes through a 42-in. main to the boilers to take care of Sunday gas requirements and a 30-in. main delivers the surplus to two turbine boosters and thence to the steel plant.

The ovens at Franklin are not of the regenerative type, and as a result the gas yield is smaller than at Rosedale. At full operation about 28,000,000 cu.ft. of surplus gas is released, which will replace approximately 570 tons of coal or 120,000 gal. of fuel oil or 15,000,000 cu.ft. of natural gas or 120,000,000 cu.ft. of producer gas. From these figures and those given for the Rosedale plant it will be seen that the savings in fuel consumption alone by installations of this character are a considerable item.

TABLE II—RECENT AVERAGE YIELD PER NET TON OF COAL CHARGED

Coke.....	70 per cent	Concentrated liquor...	1 gallon
Gas.....	10,500 cu.ft.	Ammonia sulphate.....	24 lb.
Weak liquor.....	30 gallons	Light oil.....	3 gallons
Tar.....	7 gallons	Motor benzol.....	2.4 gallons

These figures will vary, of course, with the mixtures charged in the ovens. The Semet-Solvay Co. estimates that the byproducts when the Franklin plant is running at full capacity are as follows: Tar, 40,000 gal.; sul-

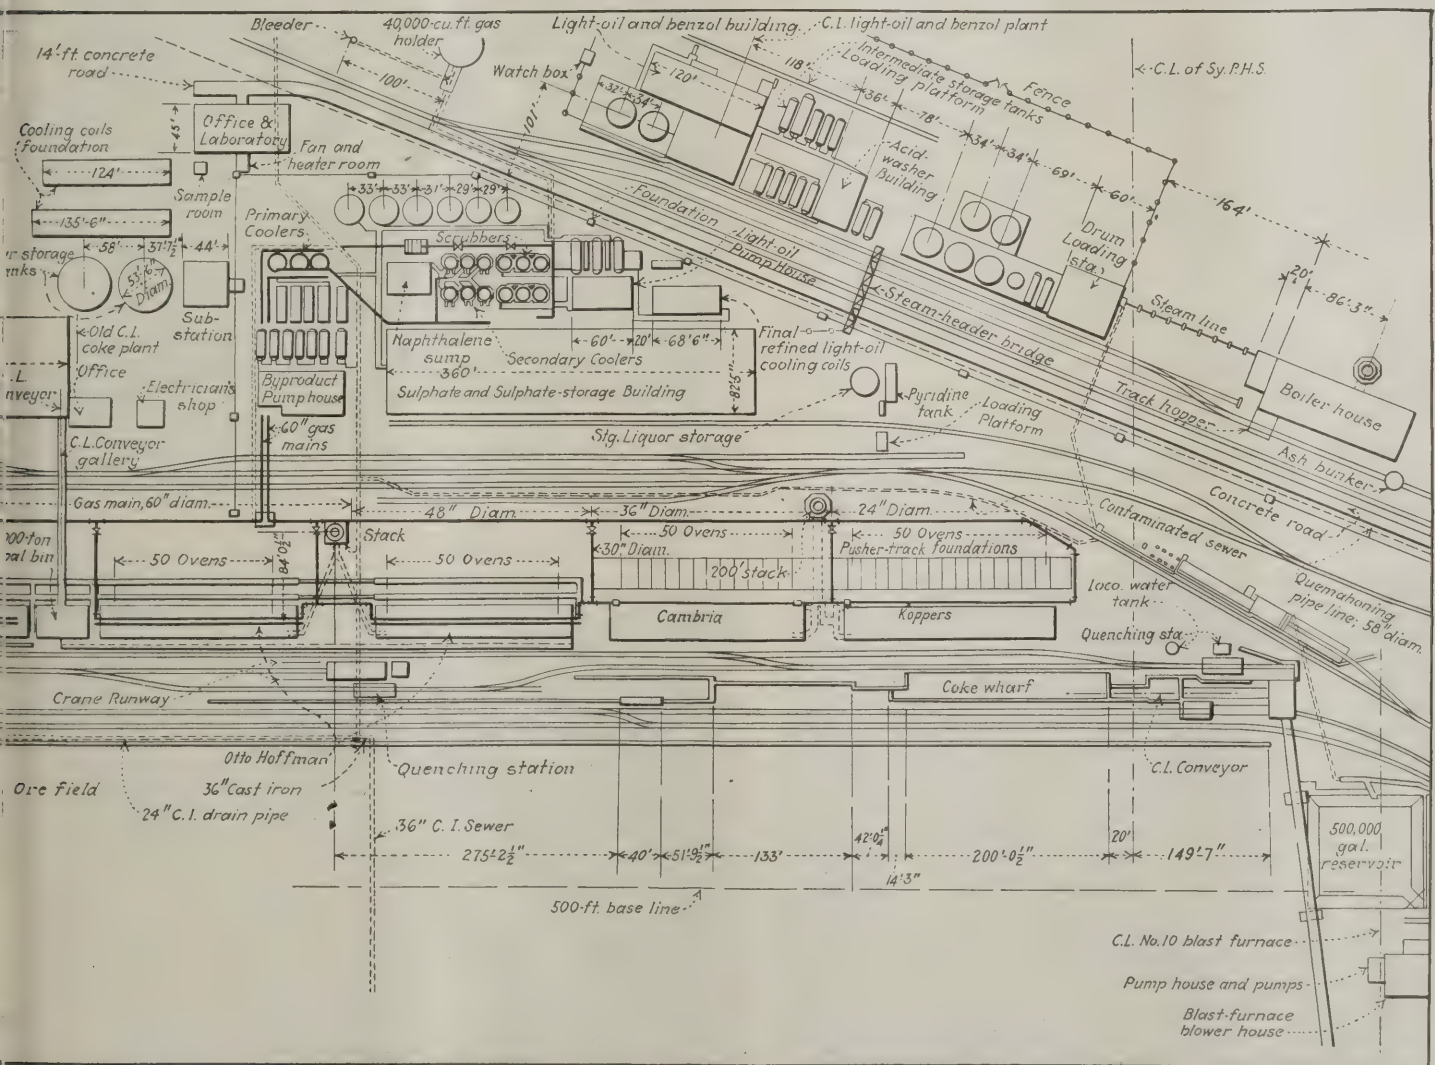

DRYING AMMONIUM SULPHATE IN ROTARY KILN

This kiln is air heated. Some industries require their sulphate of ammonia very dry, and this kiln brings the moisture below 0.15 per cent, which is the specified limit.

phate of ammonia, 126,000 lb.; light oil, 15,000 gallons.

As a rule ammonia is recovered at Franklin as ammonia sulphate. The salt precipitated in the saturators is taken to the centrifugal driers, of which there are ten. After drying it is delivered by a belt conveyor into the storage room, which will hold 5,000 tons and which measures 83x160 ft. A rotary air-heated drying kiln also is provided. Some consumers demand a very dry sulphate in which the moisture content is reduced

REFINING PLANT, CAMBRIA STEEL CO., JOHNSTOWN, PA.

ner the large ore field on the right marks the edge of the steel plant and the beginning of the plant which deals with the coal and its byproducts. This plant as it existed in June, 1912, was described in *Coal*

Age by R. Dawson Hall in the issue of July 20 of that year, pages 72-77. At that time nothing but Otto-Hoffman ovens were to be found at the plant. At the far side of the concrete road can be seen the light-

oil refining plant which purifies the light oil to motor benzol or goes further and breaks it up to form benzol, toluol, xylol and solvent naphtha. The latter benzol is the pure product.

TAR SEPARATOR AND SATURATOR AT FRANKLIN

The gas, in which the ammonia is contained, passes through a screen and impinges on flat surfaces in the tar extractor or separator. Thus the tar is mechanically taken from the gas and falls to the bottom, where it is piped to the tar decanters. The gas, purified of tar, goes to the saturator, where it bubbles through a 5-per cent solution of sulphuric acid, forming ammonium sulphate.

to less than 0.15 per cent and the acid content to an equally low figure. In order to meet this requirement the drier is provided. As at Rosedale, the sulphate is either shipped in bulk or bagged.

If desired the two ammonia stills provided to free the fixed ammonia and return it to the gas for absorption as sulphate can be used to make crude concentrated ammonia liquor, a condenser having been provided for that purpose.

Flexibility of operation is claimed by the manufacturers for the ammonia-recovery system. When sulphate is in demand, only a minimum quantity of ammonia liquor requiring distillation is produced. If, on the other hand, concentrated liquor is needed, the circulation systems easily can be reversed and, by adding small quantities of water, a large proportion of the total ammonia in the gas, whether free or fixed, can be recovered in the form of liquor. The quantity recoverable in this way will vary from 15 per cent to 85 per cent of the total, according to the coal used. The main essential in making this possible is that the stills have ample capacity, and the manufacturer asserts

TANKS IN WHICH SULPHURIC ACID IS STORED

Sulphuric acid is used for the manufacture of sulphate and for the purification of the light oil in the manufacture of benzol and its homologues.

INTERIOR OF SULPHATE BUILDING

The tar extractors are on the left and the saturators are under the eels where the big take-off pipes bend down. On the gallery floor are a line of centrifugals by which the sulphate is dried. If specially dry sulphate is desired an additional drying in a rotary kiln follows.

that the particular stills installed have a capacity four times greater than that of any other type of the same size.

Stripping stills, similar to those at Rosedale, are provided for the recovery of the light oil, together with the usual preheaters, heat exchangers, decanters, etc. From the stills the crude light oil goes into storage tanks. All storage tanks are vented into columns in front of the stills.

The first stage in the treatment of the crude light oil consists in washing it with sulphuric acid. The oil comes in at the top of the washer and is agitated by paddles which are driven by vertical steam engines. The acid also flows in at the top from a gravity feed tank, being forced up to that tank from storage by air pressure in an apparatus known as an acid monte-jus. For this washing 66 deg. sulphuric acid is used, and the quantity is determined by a color test on the oil after treatment. The general practice is to gage the work by No. 6 Barrett color. This acid wash takes out the olefines, and the sludge resulting, which is of no commercial value, is drained and sent to the slag dump.

BUILDING IN WHICH SULPHATE OF AMMONIA IS STORED

About 25 lb. of ammonium sulphate is made per ton of coal, or 1.25 per cent of the coal weight.

After the removal of the sludge, the oil is neutralized with caustic soda, which is blown over from the caustic tanks with the aid of a caustic-soda monte-jus. In preparing the caustic, holes are cut in the ends of the drums, which are then dropped into the water in the caustic tank. The sludge resulting from the neutralization of the oil is drained off into a tank and from that point goes to the quencher sewer.

The oil is agitated continuously while the acid is being introduced and is then still further agitated for a period of one hour. After this it is allowed to settle for one hour before draining the sludge and treating with caustic.

The neutral oil is run into the washed light-oil storage tank, and it is pumped thence into the refined light-oil still kettle. Steam injected at the bottom through fractionating coils vaporizes the oil. The vapors then go to the refined light-oil column, where they are still further refined, and lastly they are condensed in the refined light-oil condenser. Some of the water which also condenses in the process is separated out, and the refined light oil is pumped to the refined light-oil receiver. If no further refining is done the liquid is collected in the motor-benzol storage tank and sold as motor benzol.

ONE OF THE PUMP INSTALLATIONS AT FRANKLIN

Every part of the plant is as fireproof as tile, concrete, steel and glass can make it, as easy to keep clean as ingenuity can devise, well lighted and orderly.

When a product of greater purity is required further fractionation is necessary. Oil from the refined light-oil tank is pumped to the pure-benzol still kettle. Closed steam is injected to raise the temperature of the light oil to 80.2 deg. C., which is the true boiling point of pure benzol. The benzol vaporizes, and the toluol, xylol and solvent naphtha are run off from the bottom of the kettle and collected in the benzol-free-oil tank. This is further refined into toluol, etc.

The vapors from the pure-benzol still kettle are sent to the pure-benzol fractionating column and any toluol and naphtha that may be carried mechanically forward in the vapor are condensed and flow back into pure-benzol still kettle. The vapor passes out of the fractionating column through a dephlegmator which is in the form of a multi-tubular vessel.

The vapor circulates through the tubes while water passes around the outside of them. By regulating the flow of the water a partial condensation of the vapors is effected and only the most volatile compounds pass

BATTERY OF WATER-TUBE BOILERS

The Franklin coke ovens and refinery have their own boiler plant, containing five 768-hp. water-tube boilers, each equipped with chain-grate stokers burning coke breeze from the ovens.

off. These are condensed in the pure-benzol condenser, from which the resulting liquid flows to the pure-benzol receiver, where it is analyzed to determine its purity.

The "first runnings" of the benzol are collected in the "first-runnings" tank and are isolated in order to reduce the proportion of carbon disulphide in the "blown-over" benzol. These are then returned to the washed light-oil tank. The temperature of the still is allowed to rise, and the product that comes off contains a large proportion of benzene. This goes to the benzol test tank. Tests are made on this as a check on the analysis made at the receiver, and if it meets the specifications it is either sent to the pure-benzol storage or to the refined 90-percent benzol storage tank, depending on whether chemically pure (C.P.) or 90-per-cent benzol is being made.

Toluol is the product of a second distillation at a higher temperature. The contents of the benzol-free-oil still are pumped to the pure-toluol still kettle, where closed steam is used to raise the temperature to about 110 deg. C., at which point the toluol vaporizes. Any xylol and naphthas settle to the bottom of the kettle and are taken to the toluol-free-oil tank. The toluol vapors pass into the pure-toluol fractionating column. Here any xylol or naphthas carried forward are condensed and flow back into the kettle. The remainder of the vapor

LIGHT-OIL PUMPROOM

This installation is adjacent to the scrubbers. It pumps the light oil across the railroad tracks to the light-oil refinery, where it is subjected to the final refinement. Note how carefully all dangerous machinery is guarded.

CONTROL EQUIPMENT, LIGHT-OIL PUMPROOM

The transformers and controls are fully inclosed and placed in a brick room which forms part of the light-oil pump building but is separated by an unbroken brick wall, entrance being obtained from the outside of the building.

passes as through a dephlegmator of the same type as that used with the benzol, and then into the pure-toluol condenser, where it is cooled and condensed with water. Thence it goes to the pure-toluol receiver, where a test is taken for chemical analysis. Then it drains by gravity into the toluol test tank, where another test is made as a check on the first. If it meets the specifications it is pumped to the pure-toluol storage tank.

The product in the toluol-free-oil tank requires a little more handling than the products previously obtained. It is pumped into the solvent-naphtha-still kettle, where the naphtha fraction is driven off. The temperature of the closed steam is not high enough, and open steam is admitted to assist in the expulsion of the naphthas by mechanical means. The vapors are condensed in the solvent-naphtha condenser and then go to the solvent-naphtha separator by gravity. Any water present is separated and then the naphtha goes to the solvent-naphtha receiver. After a chemical analysis has been made and it is found that the naphtha meets the requirements it is admitted to the solvent-naphtha storage tank.

If xylol is desired, the liquid which comes from the toluol-free-oil tank is subjected to a much more careful refining process.

This briefly outlines the uses of the equipment which has already been listed. It is intended as a general and not as a detailed technical description. Its purpose is to give those not familiar with byproduct-plant operation some idea of the equipment and what actually takes place in it.

The auxiliary equipment of the Franklin plant embraces some interesting features. Foremost among these, perhaps, is the pneumatic-tube system which has been installed to expedite the sending of samples to the laboratory.

As at Rosedale, the plant has its own power house,

POWER HOUSE FROM BLAST FURNACES

In the foreground is a reservoir holding 500,000 gallons of water and on the left the conveyor which delivers the metallurgical coke, made in six of the blocks of ovens, to the stock bins for use in certain of the blast furnaces.

which is equipped in the most modern manner. It is, however, considerably larger than the Rosedale plant. It contains five 768-hp. water-tube boilers, each equipped with chain-grate stokers for burning breeze. The boiler efficiency obtained with breeze compares very favorably with that obtained with coal.

Motor-generator equipment and three 500-kva. transformers housed in an independent transformer building

VIEW OF THE VALLEY TAKEN FROM THE HILL ABOVE THE LIGHT-OIL REFINERY

On the extreme left is the boiler house. To the right of this is the acid washer building and the big gas holder. Back of the latter are the scrubbers and the large sulphate storage and sulphate building. To the right of the scrubbers are the secondary coolers. To the right of the tall stack are the primary coolers and in the right foreground the office and laboratory, which at the time when the photograph was taken for this cut was still under construction.

take care of all current requirements. The pumps are located in two separate pumphouses.

One feature that strikes the visitor is the neat appearance of all the buildings both at Rosedale and Franklin. Scrupulous cleanliness is a necessity, and a liberal use of white tiling on the side walls aids in brightening the surroundings and in enhancing the neat appearance.

The electrical equipment is of the latest type and some of the installations are models of their kind. Particular attention is called to the illustration showing the transformer and control installation at the light-oil pumping station. Everything is fully inclosed and located in a brick room which forms part of, but is separated by a wall from, the pumphouse, the only entrance being through a door from the outside.

All in all the Rosedale and Franklin byproduct plants form two installations which not only are of the most modern type to be found in this country but are among the finest. A high degree of efficiency in operation is being obtained and it is interesting to note that original estimates as to production are being exceeded.

Combustion and Mechanical Engineers Study Pulverized Fuel for Boilers

THE interest taken by a gathering of 175 combustion and mechanical engineers, in Pittsburgh on June 5, in a paper on "Pulverized Fuel for Boilers," which was delivered before a joint meeting of the mechanical section of the Engineers' Society of Western Pennsylvania and the Pittsburgh section of the American Society of Mechanical Engineers, attests the importance that engineers of this country attach to this new problem.

The discussion which followed the reading of the paper would lead one to believe that pulverization offers possibilities as a means of obtaining higher combustion efficiencies of coal, but that pulverized combustion adds difficulties to the problems of designing furnaces to withstand the higher temperatures that accompany the increased efficiency. It was generally agreed by those who participated in the discussion that the belief so firmly established as recently as five years ago that the furnace wall should be as thoroughly insulated as possible to retain the heat in the furnace no longer exists. Though pulverization does not insure complete combustion of coal it gives greater combustion efficiency than stoker feeding and simplifies control.

By way of introduction to the paper, which was prepared by J. C. Hobbs and L. W. Heller, it was pointed out that the Middle West has been most active in investigating and adopting pulverized coal for steam-producing purposes. The enormous tonnage of steam coal burned yearly justifies investigation of this problem on a large scale as a means to reduce the cost of producing energy.

Facts upon which the paper was based were obtained in a test conducted by the Duquesne Light Co. in its Colfax station. In the burning of nearly 10,000 tons of pulverized coal in an 850-hp. Stirling boiler an over-all efficiency of 84 per cent was obtained, while the heat derived amounted to 30,000 B.t.u. per cubic ft. of furnace space per hour. The coal was ground so that 65 per cent of it passed through a 200-mesh screen.

Little was said about the obstacles encountered in the test. It was asserted that the cost of good refractories to withstand high temperatures is prohibitive. The dis-

cussion marked this statement as unsound by reason of the need of better furnace design to check the rise of temperature in the furnace walls above the temperature of failure of the refractories used. This, it was pointed out, can be accomplished by passing air to the combustion chamber through hollow furnace walls or by water tubes in the wall or a screen in the furnace, the latter method being preferred.

Dr. Kreisinger, formerly combustion engineer for the U. S. Bureau of Mines, opened the discussion by stating that powdered coal gives higher efficiencies and permits higher capacities than coal in any other form. High efficiencies can be maintained under conditions of variable load and losses through banking are small, which is not the case with the stoker-fed fire. Only a few minutes are required to bring the boiler up to rating. The success in the use of pulverized coal, he affirmed, is due to almost complete combustion with little excess air. In other methods combustion losses may be 5 to 10 per cent, while with powdered coal they seldom exceed 1 to 2 per cent, and little excess air means smaller stack losses. In the burning of pulverized coal the excess air consistently may be held at 10 to 25 per cent as against 100 per cent or more when lump coal is burned.

The endurance of furnace linings, which is important to insure continuous operation, can be obtained by proper design as well as by the use of high-grade refractories. If this factor is overlooked the lining may be burned away in a short time. Molten ash usually runs to the bottom if it is not frozen by means of a screen of water tubes placed close to the walls; otherwise the furnace must be cooled and the slag punched out periodically.

Dr. Kreisinger was not in accord with a statement made in the paper that air-cooled walls should be inclined away from the furnace. His belief is that they should be vertical and that they will stand if of sufficient strength. To give the necessary strength and to hold the fire bricks in place recourse may be had to a steel casing on the outside, which should be utilized solely to retain the heat in the furnace and to resist abrasion by molten ash.

Mr. Crolis deplored the practice of charging the cost of furnace repairs and maintenance as an "experimental" item. Some of these at least should be charged to the generation of steam. He further added that the problem is one of economy as well as efficiency, and among other things, that it is not a practice in economy to crush the bulk of the coal to 200 mesh when 100 mesh will give equal efficiency. He said that nobody yet has designed a furnace which will long withstand the high temperatures of present-day practice.

It was suggested by Mr. Romb that the amount of air admitted with the coal can be increased by reducing the rate of feeding the coal.

That the results obtained with the use of pulverized coal have caused the manufacturers of stokers to develop the super stoker was intimated by J. B. Gregg. The capacity of the furnace per foot of width is now about three times that formerly obtained.

The burning of pulverized coal is increasing, according to Mr. Breslove, consulting combustion engineer of Pittsburgh, Pa. Ease of operation is one of the salient features which recommends it. He told of a small installation in Pittsburgh where a higher efficiency is being obtained in a 500-hp. boiler than is general where stokers are intelligently operated. The boiler is attended by a man who is no expert.

New Equipment

Traction Wheel Mounting for Railroad Type Steam Shovels Saves Time and Expense

TRACTION wheel mountings for heavy railroad type steam shovels, recently built, have successfully withstood tests on a machine of this type having a capacity of 6 cu.yd. Heretofore such machines have been mounted only upon standard railroad trucks, but on account of the necessity for laying track for moving the shovels much time was consumed in getting from one point to another. This size shovel is much used in large rock quarries and open mines and when blasting operations were in progress it usually was necessary to lay track and move

RAILWAY TYPE SHOVEL MOUNTED ON LARGE TRACTION WHEELS

The flexibility and ease of locomotion are important factors in the arrangement of this shovel. Limiting the location of a shovel to places where there are rails frequently results in great losses of time and money.

the shovel back from the face of the excavation and then up again after the explosives had been set off. These operations were not only costly in time and labor consumed in making the changes, but also in decreased output through time lost, and steps were taken to overcome the difficulty.

Traction wheels measuring 6 ft. in diameter and with a face of 36 in. on the front or drive wheels and 30 in. on the rear wheels were designed. The front wheels are used as drivers and power is delivered through a series of gears from the powerful hoisting engines on the shovel. Steering is accomplished by turning the rear wheels by means of a screw shaft and traveling nut. The nut, to which is attached the axle tongue, moves along the screw shaft, slewing the rear axle and wheels in the direction desired. The screw shaft is operated by a separate reversible steering engine mounted above deck alongside the boiler—out of the way yet readily accessible. Reversing the engine causes the traveling nut to move in the opposite direction. The engine is controlled and steering accomplished by means of a single lever from the engineer's position in the forward end of the cab.

Briefly summarized, the advantage of traction wheels over railroad trucks for large railroad type steam shovels are as follows: Greater mobility of machine, elimination of pit crew, easier accessibility to face of excavation, elimination of tracks and reduction of side strains and racking to the machine in general. Traction

wheels also have a marked advantage over any other type of mounting in that the traction wheels are much less complicated, simpler to operate and have a much lower upkeep cost.

The shovel has an over-all length of slightly more than 85 ft. and the over-all width is 20 ft. with a maximum height over the cab of 15 ft., while the boom extends to a height of 32 ft.

An interesting feat accomplished by one shovel recently was in a pit about 80 ft. deep and reached by a steep incline. To get the new machine into the pit ordinarily would be quite a problem, but when equipped with traction wheels the problem was much simplified. With boom up and dipper and handle in place the shovel was backed down the steep declivity under its own power without difficulty.

Soon after this shovel had been placed in operation a train of loaded dump cars was derailed when some distance from the shovel and on the way to the incline hoist. The shovel was thrown into gear, run down to the cars, a chain hooked over the dipper teeth and around the cars. In a few minutes the train was re-railed and on its way to the hoist while the shovel went back to the face ready for work. Under the old conditions it would have been necessary to unload the cars to rerail them by hand, and then reload them. While this was being done the shovel and other cars would have been standing idle if the ready mobility of the shovel had not saved the day. The shovel also has been used for handling boilers and other heavy machinery that would require the services of a locomotive crane.

Traction mountings on the 1½-cu.yd. shovel have been standard equipment for some time and their successful use led to experiments which have developed the traction wheels for all sizes of railroad type steam shovels. The traction mountings and shovel are manufactured by the Osgood Co., Marion, Ohio.

Roughening the Thread of the Coal Spiral

"IT IS KNOWN to those skilled in the art of coal cleaning," says Frank Pardee, of Hazleton, Pa., in applying for a patent on a new spiral separator, "that coal from one bed often requires different treatment from that given to coal from other beds, and it is apparent that by utilizing one or a combination of several types of corrugated jackets I can readily adapt the separator for handling materials of widely differing natural characteristics." The corrugation may be made over the whole thread or only a part, it may

MODIFYING SPIRAL SURFACE TO SUIT COAL

Here the spiral corrugations are concentric but it is not certain that this will be the best kind of roughness to adopt.

be directed in any one of several directions, may be curved or straight to suit the peculiar needs of any particular kind of coal. By testing the various spirals, that particular one may be chosen which has the right pitch and the correct type of roughness.

How Revolving Field Is Produced in Induction Motor

Explanation of the Varying Current in a Single-Phase Circuit—Combining of Phases—Grouping of Phases to Produce Magnetic Field—Visualizing the Rotating Field

BY O. E. KENWORTHY

Electrical Engineer with Lehigh Valley Coal Co., Wilkes-Barre, Pa.

THE revolving field of a polyphase alternating-current motor always has been considered more or less of a mystery. As a matter of fact it can readily be understood by one having only a slight knowledge of the fundamentals of alternating-current and motor-winding diagrams.

One of these fundamental concepts is that in a single-phase alternating-current 60-cycle circuit the current will flow in one direction through a given conductor, starting from a zero value, building up to a maximum, dying down to zero again; then completely reverse itself in direction and build up to maximum and die down to zero. This operation completes a cycle of which there are sixty in one second. This variation of the current value and direction in the conductor may be visualized by means of what is known as a sine curve, shown in Fig. 1.

The line A, always designating the vertical distance from the zero line to the curve as it moves from left to right, represents the different values of the current in the circuit at any instant during a cycle. A three-phase circuit is made up of three single phases with the instantaneous current values timed so that the currents in each phase reaches its maximum value in a given direction one-third of a cycle apart from one another. Fig. 2 will show this. Phase A is maximum at the instant of time marked X-X' while phases B and C are one-half their maximum value at the same instant. At the point marked 120 deg. phase B is maximum and A and C are one-half their maximum value. At the point marked 240 deg. phase C is maximum while A and B are one-half maximum value.

Looking at Fig. 2 again it can be seen that a full cycle has been completed for all three phases when phase A has progressed from the point marked zero to the point marked 360 deg. This may show that a cycle can be divided into 360 deg. and that in a three-phase circuit the phases are 120 deg. apart.

Again the three phases of a three-phase circuit may be interconnected in several different ways within a motor. Two of the most important connections are called the delta connection, and the wye connection. Fig. 3 is called a delta because of its resemblance to the Greek letter D or Δ . Fig. 4 is called a wye connection because of its resemblance to the letter Y.

In order to visualize the revolving field of a three-phase motor we will consider a stator winding diagram of a three-phase motor (see Fig. 5). This particular winding diagram applies to a motor having 120 slots and 120 coils. The diagram is for a ten-pole motor so

that there are twelve coils per pole, or four coils per phase per pole. Or again there are four coils per group, three groups per pole and thirty groups in all. The coils are made up of one turn each and the four coils in each group are connected in series. One can now easily see that there are ten groups connected in series for each phase. The winding is termed a "series delta."

In order to simplify the winding and make it easier to follow we will draw in the line X, Fig. 5, and considering that part of the winding above X we can construct Fig. 6 by combining the coil groups. This is a method used by a prominent manufacturing company to represent windings. Now we can see each group and its relation to all the other groups of the complete winding.

If we consider that each group can set up a magnetic flux by itself in a given direction at a given instant there will be a series of alternate north and south poles around the stator. For instance, refer to Fig. 7 and Fig. 2; Fig. 7 represents the groups, 2, 1, 30, 29, 28, 27 taken from Fig. 6. At the instant marked zero on Fig. 2, phase A is maximum, groups 1 and 28 are in phase A; phase B is one-half maximum, groups 2 and 29 are in phase B; phase C is one-half maximum and groups 30 and 27 are in phase C. Curve 1 of Fig. 7 shows the magnetic field thus set up by these groups; for convenience it is shown as a sine curve. It is easily seen that groups 2, 1 and 30 and groups 29, 28 and 27 make up two poles as shown on Fig. 6. Considering again curve 1, Fig. 7, we can assume that groups 2, 1 and 30 form a south pole while groups 29, 28 and 27 make a north pole, the maximum strength of the south pole being centered under group 28. If the reader will now follow around the winding he will see that a sine curve can be traversed around the winding showing five south poles and five north poles. (See curve 1 of Fig. 6.)

So far we have shown that at a given instant marked zero on Fig. 2 the winding produces a series of alternate north and south poles, different polarities appearing on the opposite sides of the zero line. Now if we refer again to Figs. 2 and 7 and consider the point on Fig. 2

FIG. 2—THREE-PHASE CURRENTS

In the combination of single-phase currents to produce a three-phase system each phase must be 120 electrical degrees apart. Each current wave must start a definite interval after that preceding.

FIG. 1—ALTERNATING-CURRENT VALUES

The amount and direction of the current at any given instant is the vertical distance, as A, measured between the zero line and the current line.

Fig. 3

Fig. 4

FIGS. 3 AND 4—DELTA AND WYE CONNECTIONS

These are the two common methods of combining windings for a three-phase circuit.

marked 30 deg. and curve 2 of Fig. 7 we see that the current in phase A, or groups 1 and 28, has dropped 0.866 of its maximum value, that the current in phase B, or groups 2 and 29, has dropped to zero and that current in phase C, or groups 30 and 27, has increased to 0.866 of its maximum value. Curve 2 of Fig. 7 is drawn to show this. From this curve we see that the

south pole, which was formed with its maximum strength directly under group 1 at the instant zero Fig. 2, has moved to a position where its maximum strength is directly under a point midway between groups 1 and 30, and that the north pole, which was formed with its maximum strength directly under group 28, at the instant marked zero has moved to a point midway between groups 28 and 27. Similarly taking the point 60 deg., Fig. 2, we get curve 3, Fig. 7, showing that the south pole has moved so that its maximum strength is directly under group 30 and that the north pole has moved so that its maximum strength is directly under 27. Considering the rest of the points in Fig. 2 and the corresponding curves of Fig. 7 we can see that the magnetic field set up by the winding is actually revolving around the stator.

The speed of the revolving field, of course, is entirely dependent upon the number of poles for which the motor is wound. Referring to curve 7, Fig. 7, and point 180, Fig. 2, the pole set up under group 1 has changed completely from a maximum south pole to a maximum north pole. Fig. 2 shows that this change has occurred during one-half of a cycle. We can say

FIG. 5—COMPLETE WINDING DIAGRAM

This development drawing shows the three-phase circuits very distinctly throughout the whole winding. The complete circuit may be easily traced from one line wire to the other.

then that the field has revolved the distance of one pole pitch; that is, the distance from the center of one pole face to the center of the next pole face, in one-half cycle and twice the pole pitch in one cycle. Then for 60 cycles per second the field has revolved past 60×2 , or 120 poles, and in one minute the field has revolved past 7,200 poles. If the machine is wound then as per diagram Fig. 5, the speed of the winding is $7,200 \div 10$, or 720 r.p.m. This brings out a simple method of figuring the speed of the revolving field for any 60-cycle three-phase motor, which is 7,200

divided by the number of poles. This speed is called the "synchronous speed," the full-load speed of an induction motor being about 95 per cent of the synchronous speed. An induction motor always runs at less than synchronous speed. The rotor must run slower than synchronous speed in order to operate.

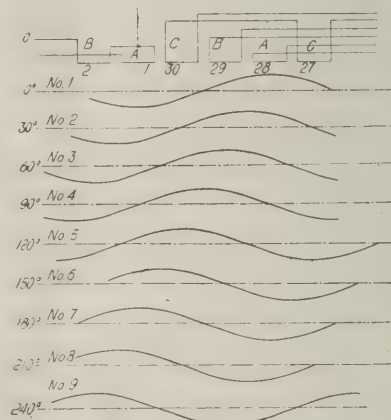

FIG. 7—SHIFTING OF THE POLES

As the electrical degrees indicated in Fig. 2 are passed the field poles progress as shown by the curves. Each field pole has a definite position, depending upon the amount and direction of the current in the stator winding.

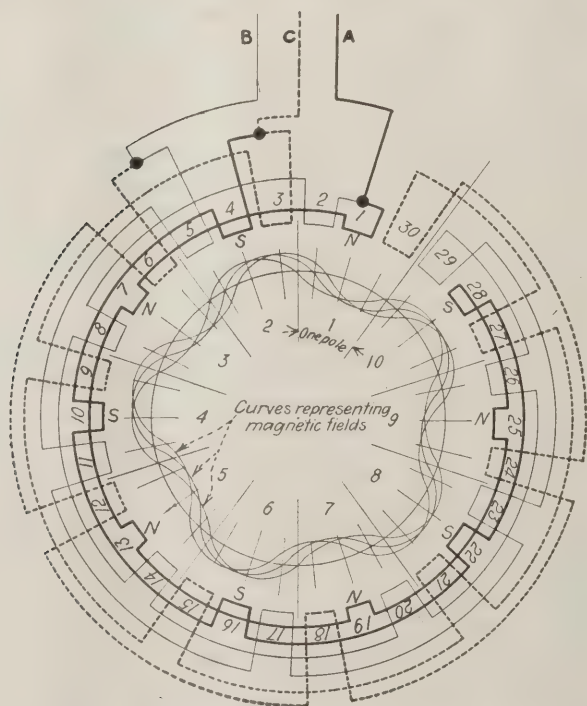

FIG. 6—STATOR WINDING AND FIELD POLES

The curves on the inside of the diagram are used to indicate the location and quality of the poles created by the current in the winding. That part of the curve wave which is on the outside of the circle is considered as being a south pole while that part of the curve on the inside of the circle represents a north pole. The three curve positions considered as existing in three successive instants of time visualize the shifting of the poles in a clockwise rotary motion.

Germany Imports Less Coal During May

Imports of bituminous coal into Germany in May, according to German official statistics, were as follows in metric tons:

Sarre.....	50
Great Britain.....	1,667,099
Czechoslovakia.....	84,867
Polish Upper Silesia.....	583,831
Other Countries.....	59,803
Total.....	2,395,650

How the importation of coal has grown since the commencement of the Ruhr occupation is shown in the following monthly tabulation as compared with the last three months of 1922, in metric tons:

	October	November	December	January
Bituminous coal.....	2,146,226	1,799,965	1,471,559	1,870,127
Brown coal.....	127,972	54,685	81,045	86,829
Coke.....	43,650	48,019	18,987	27,107
Briquets { bituminous coal.....	5,942	11,973	7,098	2,871
brown coal.....	95	135	665	945

	February	March	April	May
Bituminous coal.....	1,421,832	3,397,658	2,695,152	2,395,649
Brown coal.....	121,115	247,345	233,997	83,031
Coke.....	16,565	71,954	132,379	95,699
Briquets { bituminous coal.....	6,996	13,413	22,258	23,678
brown coal.....	7,099	12,800	3,240	1,784

Machine Bookkeeping Speeds Accounts at the Mine

Here Is a System of Sales Accounting Which Puts Correct Bills Out on Time and With so Little Labor That Two Clerks Can Serve a 4,000-Ton Coal Operation

By JOHN C. MCNEIL

Certified Public Accountant, Louisville, Ky.

IT MIGHT safely be assumed that every coal operator in the country is interested in reducing the cost and increasing the accuracy and speed of his sales accounting at the mine. It is the purpose of this article to offer a plan by which any operator can do that very thing. Lessening lost time, getting bills into the mail always exactly at the end of the month, making disbursements well within the discount period, keeping accounts up to the minute, all have their cash value to a mining company, which can be realized through this improved bookkeeping method.

The usual method of accounting for coal sales at the mine is first of all to render to the railroad a bill of lading covering the coal shipped. After this is returned from the coal-billing station, an entry usually is made in the shipping book, charging the coal to the customer, the entry showing to whom the coal was shipped and what was the weight of the shipment. Extensions are then made, and a record is entered in the shipping book from these data. From this the invoice is prepared. Some concerns reverse the order, making the invoice first and then writing the data in the shipping or sales record. The sales ledger is then posted, either from the shipping book or from the duplicate invoice.

The postings to the sales ledgers are then proved and at the end of the month the sales ledger is balanced with the controlling account in the general ledger, statements are taken off, added and compared with the sales ledger. Coal often is shipped to some railroad station where there is no agent, necessitating the prepaying of freight charges on the shipment. In this event it is necessary to make a debit charge against the customer, to journalize this charge, post it to the ledger and then enter it in the controlling account in the general ledger.

USUAL PLAN, THOUGH SLOW, WILL SERVE

Allowances often have to be made to the customers on account of faulty preparation, which allowance has to be posted or journalized, the proper account being credited in the sales ledger, the same item being posted to the controlling account in the general ledger. All these items, of course, have to receive consideration in preparing the statement against the customer. When the customer pays on his account, the check is taken, compared with the account in the sales ledger, written up in the cash book of the sales ledger account, and is posted to the credit of the customer in the sales ledger, postings being proved, so as to show that no credits have failed to receive consideration.

That method of handling the sales account will produce the desired results, provided it is carefully and accurately done, but the repeated copying of figures is likely to introduce errors and the time involved in doing the work in this way and the strain which comes at the beginning of every month greatly delays statements, for the clerical force has at that time to do a lot of balancing of accounts in order to be sure that every-

thing ties in properly. Delays in getting statements to the customer mean delays in getting returns; thus capital is tied up unnecessarily, and a larger investment is needed than would be necessary with a better accounting system.

The efficiency exhibited in the management of production is lost if that efficiency is not carried through all departments. Whenever the work is done by the usual methods and done with due accuracy too long a time passes between the day when the amount the customer owes is on record and the day when the cash is deposited in the bank. Of course the work must be done accurately or it is practically useless. The purpose of this article is to reduce the cost of transporting these accounts through the office by reducing the number of men employed and by making use of mechanical equipment—precisely the same result we expect to derive from introducing mechanical haulage at our mines. Combining as many operations as possible into one will effect this result.

We will now take up the work by the new methods, commencing with the bill of lading as it stands after the railroad weights have been inserted. On the memorandum or office-file copy we ascertain the tonnage, multiply this by the price per ton and pencil in the name of the customer. After we have made these calculations on all of the memorandum bills of lading for the day, we go to the adding machine and total the tonnage of the shipments and their value, saving this tape as a showing of the total tonnage shipped and its aggregate selling price.

We are now ready for handling this information in our bookkeeping machine. The superintendent long ago replaced the old hand picks by undercutting machines. Just as he has demonstrated to us the efficiency of machine methods in mining, we are going to demonstrate to him the superiority of machine over pen methods in bookkeeping.

FOUR FORMS AND THREE CARBONS IN MACHINE

We put Form A-1, our "daily audit sheet of coal sales," in our machine and let it stay there. This is placed under a carbon sheet in roll form in the machine, and, as we want to charge our customer, we put in also at the same time the accounts receivable ledger sheet, Form A-2. As we want to mail our customer a monthly statement of his account at the end of the month, we put in a third sheet, Form A-3, "statement of account" under which is a carbon roll. We also put the invoice in the machine over a carbon sheet. So now we have four forms and three carbons in the machine.

We then collate our memorandum bills of lading according to customers, and, assuming that we have not had any account with the customers, we take each bill of lading and write the data on the invoice, showing first the date, the order or invoice number, the car initial and number and then the grade. Moving over into the

weight columns, we insert the weight in pounds and then in tons. We next insert the price which he is to be charged. Then in the amounts column we place the amounts or extension on each car.

When we have entered all the bills of lading for this customer on the little adding machine we have over the amounts column the totals of these items of the invoice, and we move over into the charge column and write this total. As we have no more charges for this customer, we move over on the statement, and, in the balance-due column we write the amount which our machine has automatically accumulated for us as the balance.

After making each entry of each bill of lading, we distribute the sizes by tonnages and amounts, writing these entries on the part of our sales sheet that extends beyond the other forms. This we do by moving over and making entries in the appropriate columns. Assuming now that we have some more charges to this customer, we put in a new invoice and over in the extreme left of the invoice, in "old balance" we write the amount shown at the right of the statement sheet "balance due" and proceed as before.

Suppose that now we have paid the freight on a car for a customer to a prepaid station. We leave the coal-sales sheet in the machine, removing the others, take the ledger sheet and the statement sheet and put them in the machine. We take the debit memorandum, Form A-5, and after writing the balance in the "old-balance" column, we fill in the date, number of the charge ticket, the data in the data column and the amount in the charge column, after showing such items as are necessary in the items column. After writing this in the charge column we move over to the "sundry" column of our sales sheet and write the credit to our prepaid freight account.

WE ARE NOW READY TO CHECK OUR FIGURES

After we have written up all the bills of lading for that date, we write in the totals at the bottom of the following columns: Pounds, tons, debit sales ledger, old balance, new balance, repeat old balance, tons and amounts under "block," "egg," "R.O.M.," "slack" and "sundries." If we have done our work correctly the total tons will agree with our adding-machine tape of tonnages and the total debit to sales ledger will agree with our total amounts, plus any freight charges we have made. The total debit to sales ledger will agree with the total credits in the sales-distribution columns.

The distribution of the different tonnages will agree with the total tonnages shipped. To these totals we will add the accumulation for the previous dates, and the last sheet at the end of the month will show us the total tonnages shipped, the total debits to our sale ledger and the corresponding credits, giving us one entry for posting to our general ledger at the end of the month. As we have the total tonnages for the month by grades and the total amounts by sizes it is an easy calculation for us to determine the selling price averages by sizes, and also the general average for the month.

We have now completed our sales sheets and are ready to enter remittances. We put first into the machine Form B-1, "daily audit sheet of credits to accounts receivable." Let us suppose now that we have a check from the Ohio Valley Coal Co. paying on account; so we get their ledger sheet, Form A-2, and their statement of account, Form A-3, putting the necessary carbons between them.

We write in the "old balance" column the balance as

shown by the statement, the date and sufficient data to identify the check or remittance received and put the amount in our credit column. Our machine has told us the balance left after this payment, so we write the balance in the balance-due column. We then write the name of the customer on our credit sheet and as we are running three bank accounts and are making daily deposits, we charge in the proper column the bank in which we are going to place the check.

HOW TO ENTER ALLOWANCES AND COMMISSIONS

Now, possibly, we have a contract with the Ohio Valley Co., whereby we allow them a commission on their sales, or it may be that we wish to make them an allowance because of faulty preparation, excess freight or some other allowance which always confronts the coal man. We take our ledger and statement sheet and put them in the machine. We then take a "credit memorandum," Form B-2, and put it in the machine, write in the data and put the total of the items credited in the "amount credited" column, writing on the statement the automatically calculated new balance due, at the same time making an appropriate charge on the daily credit sheet. When we have finished our total credits for the day, the total credits to our sales ledger will agree with the total debits to banks and sundry items and by bringing these items forward from day to day we have totals for posting to our general ledger.

After entry of the last day's business, which at the average mine will be around the first or second of the following month, depending upon the rapidity with which we receive our weights, we are ready to mail out our statements. These statements to the customers are itemized in every respect and proved with the ledger accounts to the penny.

Because we are able to get our statements in the mail so promptly at the end of the month we are going to be able to collect on the 10th, as sales agencies will not be able to put up the usual excuse of delayed statements.

The basis for the disbursements entry is the vendors' invoice. The vendors' invoices for each day are assembled in alphabetical order, and an adding-machine run is made of them for the predetermined total. The distribution of the charges is indicated on each invoice. A voucher, Form C-1, is prepared in duplicate for each vendor. At the time the entry is made on this it is copied through by carbon process on the purchase-record sheet. The first items for each vendor are written in order according to the invoices, entry being made in the detail column and the daily total moved over into the next or credit column. The balance is calculated by the machine and written in the "new-balance" column.

UNNEEDED ENTRIES TORN OFF AT PERFORATION

It is well to call attention here to the reversal of the usual order of debits and credits so as to use the same machine for handling receivables and payables. If there is already a balance in favor of the vendor this balance is written in the old-balance column and the machine automatically calculates the balances.

After entry is made in the voucher, corresponding charges to the various subsidiary expenses in the general ledger sheet are made on the purchase record, Form C-2. It will be observed that Form C-1 is perforated just to the right of the "old-balance" column, so that the check and remittance slip will go to the vendor without the old-balance pick-ups being shown.

At the end of the month or whenever the vendor's or

creditor's amount is due, there is nothing to do but draw the check. The usual custom with coal companies is to deduct a fixed percentage, say 2 per cent, of the total month's charges for payment between the first and fifth of the succeeding month. Check record, Form C-3, is placed in the machine and the vouchers (original and duplicate) are arranged for vouchering. The last amount in the balance column is written in the "old-balance" block, at the left of the check and the name and address of the payee written in. At the same time the date and check number are put in.

The amount of the discount to be deducted is written after the name of the payee, and the machine automatically calculates the balance due. The duplicate voucher can then be filed in alphabetical order, to which is attached all of the invoices covered by the voucher. It will be observed from this that Form C-3, being in the machine, will automatically get at the extreme left the debit to accounts payable, the credit to purchase discounts and the net amount of the check. As we have provided in the receipts side of the cash book for three banks, similar columns are provided on the check register and the bank on which the check is drawn should be credited by entry in the proper column.

A few checks necessarily will have to be written for payrolls, and other items not affecting accounts payable, and for that reason debit columns have been provided. In writing a check for this kind of a transaction the entries are not accumulated in the "old-balance" column or in the discount column.

LEAVE AS LITTLE AS POSSIBLE TO MONTH'S END

The advantages of this system over ordinary pen-and-ink methods are that balances are automatically accumulated after each transaction. There is no lost time at the end of the month in preparing statements for debtors and proving them with the ledgers. Remittance advices and vouchers are ready for mailing to creditors after the last invoice is entered.

The totals of each column of the proof sheets are written in from adding registers at the close of each day, the amounts for the previous day to date written next and the last line will show the totals down to date. After making the entries for the last day of the month, totals are ready for posting to the general ledger without having to recapitulate a large number of sheets.

Proofs of accuracy of the work are obtained from the daily audit sheets in the following manner:

A-1, Coal Sales Sheet—

Old Balance agrees with Repeat Old Balance.

Pounds in "Railroad Weights" will be two thousand times amount in tons.

Total Tons in "Railroad Weights" will agree with total tons by grades.

Debit to Sales Ledger will agree with Distribution Credits.

B-1, Credits to Accounts Receivable.

Old Balance agrees with Repeat Old Balance.

Credit Sales Ledger agrees with Debit Distributions.

Both Forms

Total of "Old Balances" and "Debits" agrees with "Credits" and "New Balances."

C-2, Purchase Record

Old Balance agrees with Repeat Old Balance.

Credits agrees with detail distribution of debits.

Old Balances and Credits agrees with Debits and New Balances.

C-3, Check Register

Old Balance agrees with Repeat Old Balance.

Totals of three bank columns and discounts agrees with totals of All Debit Columns.

If the company produces 100 cars of coal per day and handles 300 payable invoices daily, the bookkeeper can handle this system in less than four hours per day, provided the tonnage calculations and bills of lading are priced for him. Two people can handle the accounts receivable and payable for a 4,000-ton operation with this system, an impossibility with pen-written books, to say nothing of the advantages of rendering accounts promptly at the close of each month.

June Explosives Sales Show Increase

Sales of explosives in June 1923 for use in the United States according to the U. S. Bureau of Mines amounted to 529,697 kegs of black powder, 4,442,175 pounds of permissible explosives, and 18,174,435 pounds of explosives other than permissibles. Each of these figures represents a large increase over sales in June last year. The figures are based upon reports of manufacturers whose yearly sales represent 85 per cent of all black powder used in the United States, 88 per cent of all permissibles, and 81 per cent of all other high explosives. The sales in May amounted to 502,747 kegs of black powder, 4,894,200 pounds of permissibles, and 21,546,905 pounds of high explosives other than permissibles.

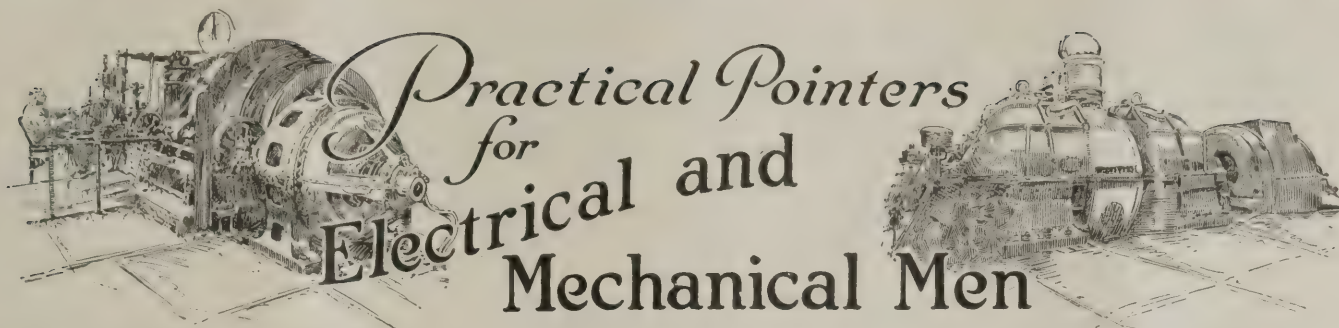

The June sales of black powder were considerably in excess of the amount sold in June 1922 and 1921. Since the beginning of the present calendar year, sales of black powder aggregating 3,643,093 kegs have been reported to the bureau, representing an increase of 63.2 per cent over the amount reported for the first half of 1922, and 49.5 per cent over the 1921 six-months period. Of the total amount sold to date in 1923, coal mining required 87.1 per cent, other mining 2.1 per cent, railway and other construction work 4.8 per cent, and miscellaneous purposes 6.1 per cent. The number of kegs of black powder used by coal miners to date is 3,173,933 kegs, equivalent to 79,348,325 pounds, an amount representing 245 pounds for every thousand tons of coal produced in this country since January 1.

The quantity of permissibles sold in June was much larger than the amount sold in the corresponding month of one and two years ago. The total sales for the first half of 1923 were 29,127,152 pounds, exceeding the record of the first half of 1922 by 93.4 per cent and of the first six months of 1921 by 64.4 per cent. Of the total sales during 1923 to date, 93.7 per cent was for coal mining, 1.3 per cent for other mining, 0.6 per cent for railway and other construction work, and 4.4 per cent for miscellaneous purposes. For each thousand tons of coal produced since January 1, the consumption of permissibles has averaged 84 pounds.

Sales of high explosives in June other than permissibles were greatly in excess of those for June 1922 and 1921. For the first six months of 1923, sales of 115,155,946 pounds were reported, an amount 44.4 per cent in excess of that for the corresponding period last year and 51.4 per cent above the sales during the first half of 1921. Of the total 1923 sales, 16.0 per cent was for coal mining, 40.9 per cent for other mining, 10.0 per cent for railway and other construction work, and 33.1 per cent for miscellaneous purposes.

Cement Shipments and Stocks Decline

Production of portland cement during July, 1923, according to the Geological Survey, totaled 12,620,000 barrels, as compared with 11,557,000 barrels in the corresponding month of 1922, and 12,382,000 barrels in June, 1923. Shipments for the month were 13,712,000 barrels, as compared with 13,850,000 barrels in July, 1922, and 13,307,000 barrels in June, 1923. Stocks at the end of July amounted to 8,076,000 barrels, as compared with 8,433,000 barrels in July of last year, and 9,168,000 barrels in June of this year.

Placing Winding on Locomotive Armatures

TO insure the best life from an armature, extreme care should be used to see that every point that might cause failure is guarded in a satisfactory manner while the armature is being wound. First of all, any sharp corners and any roughness in the slots that might damage the coils should be filed down and all chips and filings removed before applying the insulating material to the core. In applying the insulating material on the coil supports, the material should be evenly placed, and thin spots avoided.

Fit of Coil in Slot.—The coils should fit tightly in the slot and wind so that the top of the coil is $\frac{3}{8}$ in. above the band groove. Fillers should be used between the coils if necessary to meet these conditions. This will permit the bands to pull the coils down tightly and at

back to such a distance that there will be no untinned copper in the commutator neck. The cotton sleeving on the leads should not be allowed to get into the commutator slot, as it may hinder soldering to such an extent that a poor connection will result. The tool used in driving the leads into place should be free from sharp corners that might nick the leads, as a nicked wire may result in a broken lead.

Layout of Commutators.—Most direct-current windings used in haulage motor work are of the wave or two-circuit type. In laying out such a winding it is necessary to know the throw of the coils and the throw of the leads. The throw of a coil is the distance spanned on the core designated in terms of the slots—that is, if the coil throw is stated as 1 and 8, the bottom of the coils lies in slot No. 1, while the top of the coil is in slot No. 8. In a similar manner the throw of the leads is the distance spanned on the commutator in terms of the commutator bars.

When there is an odd number of leads per coil or if, when a dead coil is taken care of, an odd number of leads remain, the following is the method to be used:

Locate the center between the slots indicated by the coil throw. If the lead throw is an odd number of bars, this center will line up on a commutator bar, and if it is an even number of bars, it will line up on the mica between bars. This bar or mica is the starting point for laying off the commutator. If there is an odd number of bars in the throw, take one less than the number of bars and count off half of this number each direction from the starting bar, and this will give the first and last bar of the commutator throw. If there is an even number of bars in the throw, count off half the number in each direction from the starting mica. A check is to count from the first to the last bar, and see if it agrees with the information given. As the first coil put down will have an odd number of leads, the center one of the top and bottom leads should be placed in

FIG. 1—LAYOUT OF WINDING WITH AN ODD COIL THROW AND AN ODD THROW OF LEADS

Care should be exercised at all times while placing the winding; this is especially true when placing the first coil, which locates the others which follow.

the same time finally rest on the iron, which allows minimum movement of the coils in the slots. If the coils are wound too high the bands will not rest on the iron and when the insulation dries out in service loose bands will result.

Winding Coils in Slot.—The coils should not be twisted, bent or abused any more than is absolutely necessary to get them in place. Care should be taken not to get the wires or leads crossed in such a manner that when pressure is applied in banding short-circuits will occur. The coils on the end windings should be down, so as to make a solid foundation for the bands, but pounding should not be carried to the extent that the coils or leads will be damaged. Insulating protecting pieces should be placed at all points where the coils cross and where there is danger of short-circuit occurring. It is good practice to weave braid between the leads directly back of the commutator, both on the top and bottom layers.

Armature Coil Leads.—The leads should be tinned

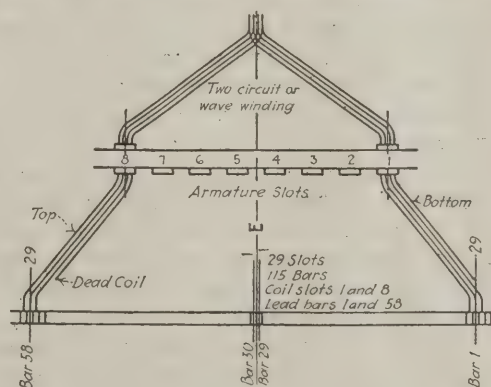

FIG. 2—LAYOUT OF WINDING WITH AN EVEN COIL THROW AND AN EVEN THROW OF THE LEADS
With this development there is a dead coil. This results when there are an even number of coils per slot.

the first and last bar of the throw as determined. Sample layouts are shown in Figs. 1 and 2.

A slightly different method is necessary when there is an odd number of coils per slot and an even number of slots. This seldom occurs, however. In this case, if the lead throw is an odd number of bars, the center, as indicated by the coil throw, will line up on the mica, and if an even number of bars, it will line up on a bar. If there is an odd number of bars in the throw, take one less than the number of bars and count off half this number to the left and one more than half to the right, and this will give the first and last bar of the commutator throw. If there is an even number of bars in the throw, count off half the throw to the right and one less than half to the left. If there are two leads in the first coil, No. 1 lead should lie in No. 1 bar, and if there are four leads in the first coil, No. 2 lead should lie in No. 1 bar.

ALIGNMENT OF COMMUTATOR BAR AND MICA WITH ARMATURE TOOTH AND SLOT CENTER LINES

Coil throw	even	} mica with tooth
Lead throw	even	
Coil throw	odd	} bar with slot
Lead throw	odd	
Coil throw	even	} bar with tooth
Lead throw	odd	
Coil throw	odd	} mica with slot
Lead throw	even	

Winding Rules.—The wave or two-circuit winding always requires an odd number of commutator bars.

When an even number of coils per slot are used there always will be an idle or dead lead.

When an odd number of coils per slot are used and there are an even number of slots on the armature, there will always be an idle or a dead lead.

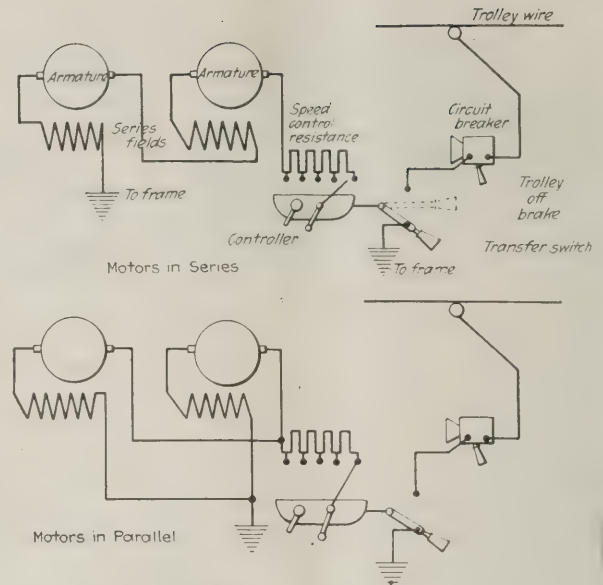

When an odd number of coils per slot are used and there are an add number of slots on the armature, there will never be an idle or a dead lead.

Dynamic Braking of Electric Mine Haulage Locomotives at Hazleton Shaft Colliery

IN THE development of the local coal basins of the Hazleton Shaft Colliery it was found necessary to drive backswitch gangways on account of basins rising ahead on an average of approximately 8 per cent. The length of these gangways is about 2,000 ft. The customary way of gathering and handling 12 loaded cars down the grades was by attaching an electric locomotive to the trip and placing steel shoes under the car wheels. Trouble was frequently experienced due to the shoes becoming dislodged and falling out from under the car wheels. This exposed the motorman as well as the locomotive and equipment to the danger of a runaway or wreck, with the result that the motorman reverted back to the method of hand spragging the wheels.

This method was found to be very injurious to the running gear of the mine cars as well as the locomotives in general and resulted in a high maintenance cost. Due to this method flat spots developed on the wheels very rapidly. A few trips in this section was sufficient to ruin the locomotive and car wheels due to sliding over the heavily sanded rails. Wheels in this condition reduced the number of mine cars possible to cage at the foot of the mine shaft with a normal force of men.

The question of a more suitable means of controlling the load on these grades became a problem for the colliery electrical department to solve. After careful consideration it was decided to apply means for dynamic

LOCATION OF TRANSFER SWITCH

These sketches show the connections of the motors in series and in parallel when effecting electric braking. Without any further change than grounding the trolley cable, electric braking is accomplished. Under certain conditions the parallel operation may cause one motor to generate power into the other motor and tend to drive it as a motor.

braking on the locomotives and this was to be accomplished with the minimum delay. The present or standard control equipment on the locomotives was used with the addition of a single pole double throw knife blade switch for the purpose of disconnecting the trolley circuit from the motors and to provide a circuit through the motors for control of the transition from motor to generator action, as it will be understood that the motors are converted into generators when driven in this manner, the trailing load furnishing the necessary power for electric braking.

The operation for braking is to reverse the motors so that they are connected in series or parallel depending upon the amount of retardation desired. The reverse handle on the controller provides this means, and the control handle is used for varying the resistance in series with the motors now operating as generators. The braking effect can be controlled by decreasing the resistance which increases the braking power, and this in turn decreases or controls the speed of trains down grade. The resistance here referred to is the same resistance used for speed control when operated as a haulage locomotive. This method of electric braking has been in successful operation for the past several months. The accompanying wiring sketch will give a clear idea of the arrangement and operation.

PETER BROADT.

Division Electrician, Lehigh Valley Coal Co.,
Hazleton, Pa.

Owing to the steepness of the grades on which this locomotive is used and the weight of the loaded trip it is probable that the braking is nearly always done with the motors in series. This being the case the difficulties mentioned by Mr. Holsopple in his article, which appeared in the Aug. 23 issue of *Coal Age*, when operating the two motors in parallel as generators is not experienced.

This is a real case where greater safety, less maintenance cost and better output are realized at once, through the application of the principle of electric braking. No doubt many opportunities similar to this one exist in nearly all mines.

Problems of Operating Men

Edited by
James T. Beard

Developing Two Coal Seams on Steep Pitches

Mine Opened by Cross-Tunnel—Main and Counter Levels Driven Right and Left in Seam—Coal Mined by Chutes on the Full Pitch of the Seam

REFERRING to the inquiry that appeared recently in *Coal Age* (June 7, p. 942), regarding the best method of developing two coal seams, pitching 45 deg. and separated by 125 ft. of strata, where the physical conditions are such that the seams must be approached from the hanging wall side, I will say that the plan suggested of driving a cross-tunnel to reach these seams is quite practical.

In British Columbia there are two coal properties, both of which were opened under conditions that must have been similar to those here described—the Hosmer mine, on the Canadian-Pacific Ry. and the Coalmont mine, formerly operated by the Columbia Coal & Coke Co. The Hosmer mine was developed by two tunnels, while the mine at Coalmont was opened by a single tunnel only.

In the inquiry to which I have referred, no mention is made of the seams generating gas; but I will assume they do, as that is most common under conditions such as have been described. My plan would be to make ample provision in the cross-tunnel for a permanent traveling way for the men going to and from their work, as the town will undoubtedly be built where the plant is located.

DETAIL DESCRIPTION OF THE DEVELOPMENT

The tunnel should be driven 18 ft. wide and 7½ ft. high, which will give room for a double-track haulage road and a manway on one side. Safety holes should be provided on the manway side of the tunnel, at intervals of 100 ft. apart, and these should be cut 5 ft. wide and 8 ft. deep and kept whitewashed and free of every obstruction at all times.

For the ventilation of the tunnel while driving and also for that of the mine until a second opening and return air-course is provided, a good substantial partition should be built in the center of the tunnel. The partition should be provided with explosion doors, every 100 ft., which will serve to relieve the pressure on the brattice caused by the heavy blasting common in tunnel-work.

To provide ventilation during the development of the mine, a fan of sufficient capacity should be installed on the surface, at one side of the tunnel, where it will not be in a direct line with the heavy concussion due to blasting. A conduit built on an easy curve should connect the fan with the tunnel opening.

Where the cross-tunnel intercepts the coal seam I would start driving the main entries to the right and

left of the tunnel, on a grade of 8 in. per 100 ft., in favor of the loading cars. These main entries should be 12 ft. wide and 8 ft. high and provided with a ditch 2 ft. wide and 18 in. deep, made in the coal on the low side of the entries.

At the same time, an air-course should be started in the formation above each main entry, leaving a 50-ft. pillar of coal between the entry and the air-course. The air-course should be driven 10 ft. wide and 8 ft. high and connected by crosscuts with the main entry, at intervals of 60-ft. centers.

COAL LAGGED ON HIGH SIDE OF ENTRIES

In order to prevent the coal from falling from the rib on the high side of these openings, posts 12 in. in diameter should be set 5 ft. apart and properly lagged, in both the main entry and the air-course above. In the later development of the mine, the crosscuts will serve as chutes for the extraction of the coal in the rooms.

When the entries and air-courses have advanced 100 ft., on each side of the tunnel, I would at once start two pairs of rise headings, one on each side of the tunnel. I would push these raises through to the surface or outcrop with all possible speed, employing three shifts for that purpose.

The idea of making three shifts is to provide second openings as quickly as possible and enable the full development of the mine to proceed without delay. This is important inasmuch as the mining law, in most cases, limits the number of men to be employed in a mine, until a second opening and escapeway is provided.

At the points where the rise headings reach the surface, two large ventilating fans should be installed. These fans should have ample capacity for the future development of the mine; and great care must be taken in laying out the work in respect to this feature, in order to reduce to a minimum the expense of ventilation and make the mine healthy and safe for work.

RETREATING PLAN, CHUTE MINING

When this preliminary work has been accomplished the development of the mine can proceed without further delay. If the invested capital will permit, the main entries and air-courses should be driven to the boundary lines of the property and extraction of the coal commenced at those points on the retreating plan of the room-and-pillar method of mining. The rooms should be driven 25 ft. wide, on 60-ft. centers, leaving 35-ft. pillars between them.

The general plan adopted in working this seam of coal is that known as "chute mining." I do not consider it practicable to make the length of the chutes or the distance between levels such that there will be danger of breaking and crushing the coal on this account. The length of the chutes and distance apart of the levels must be determined with this idea in view.

Counter-levels and air-courses are driven to the right and left of each pair of raises, after the manner described in respect to the main entries and air-courses. In order to preserve a proper breaking line across the several levels, it is important to see that the work in the upper level is kept in advance of that in the level next below, in each case.

In conclusion, I would suggest that it is possible to adopt some economic system of dropping the coal mined in each level, by a suitable conveyor system installed on the rise headings mentioned, and that matter should receive careful consideration.

AJAX.

Welch, W. Va.

[We assume this correspondent has in mind the mining of the two seams independently, completing the extraction in the upper 5-ft. seam, before attempting to work out the 6-ft. coal lying 125 ft. below.—EDITOR.]

ANOTHER LETTER

Tunnel to reach seam—Main heading driven up pitch, with levels to right and left—Extraction by longwall face at angle with pitch.

MY METHOD of working the two seams pitching 45 deg., mentioned in the inquiry of L. L. Travis, *Coal Age*, June 7, p. 942, would be to adopt the longwall system of mining. The plan should be carried out in such a way that the longwall face can be arranged at an angle with the pitch best adapted to the working of the coal in question. This will vary with the conditions existing in the seams and can only be determined in the course of development.

When the cross-tunnel has reached the upper or 5-ft. seam a main heading should be driven directly up the pitch to the outcrop of the seam, a distance described as about 2,000 ft. At the same time I would drive two levels, respectively right and left in the seam, giving to each road a grade that will afford the best results in hauling the loaded and empty cars out and into the mine. This grade must be carefully calculated according to the size and number of cars hauled in a trip. The main levels must be driven perfectly straight to insure good haulage.

MAIN LEVEL AND AIR-COURSE DRIVEN IN ROCK

One of the chief points to be considered, in driving the levels in a steeply pitching seam, is to provide for the support of the rib on the high side of the road. For that reason, I would drive the main right and left entries starting from the face of the tunnel by taking out 10 ft. of bottom rock on the high side. Then, for a clear width of roadway of, say 8 ft. and 6 ft. of headroom, on a pitch of 45 deg., there would be 2 ft. of rock to lift on the low side of the road.

By this means, the main road would not be materially affected in the extraction of the coal all of which is to be taken out in the longwall method. In this plan, a low level should be driven about 30 ft. below the main level and, in the course of development, this low level could be cut off at distances of 400 ft. by an angle road from the main level. The extraction of the coal between the two levels would afford ample room for the storage of the waste rock taken from the main level.

When the main heading has been driven up the pitch 150 ft., two more levels can be driven to the right and left, respectively. Unlike the main level, however, these counter-levels must be brushed mostly in the top, since the heading has to serve as a chute into which the coal

from these levels must be dumped. As the levels are advanced a suitable distance, a panel is formed and the extraction of the coal between the two levels started by arranging a longwall face at a suitable angle with the pitch of the seam.

CONVEYOR USED ON LONGWALL FACE

My idea would be to erect a conveyor on the line of this longwall face so that all of the coal can be carried to the main level and there loaded into cars to be hauled out of the mine. The size of the panel, distance between levels, the angle of the longwall face with the pitch and the style of conveyor adopted must all be made to conform to conditions found to exist in the seam.

Regarding the support of the roof, it should be stated that wooden cribs will be required to be built on the high side of the road on all counter-levels, while the main heading will require to be cribbed on both sides of the road. It will be necessary to brush the roof on the heading, the rock from which can be built on each side of the road. The longwall face will also require cribbing at intervals and these cribs must be taken out as the work is advanced. After the first great break-occurs, the settlement of the roof will be more gradual.

My preference for the longwall method of working is that it will require far less timber, practically no explosives and afford a more complete extraction of the coal. If this system is found to work in the upper 5-ft. seam, the company has got an "Eldorado," as cross-levels can be driven, at suitable points on the main level, and the coal in the second seam taken out through these openings.

JOHN MCNEIL.

River Herbert West, N. S.

Arbitration of Disputed Authority of Mine Inspector

Protracted method of arbitration prescribed by law fails—The law in British Columbia more direct in accomplishing results.

IT WAS with some surprise that I read, a short time ago, in *Coal Age* (May 24, p. 862), an account outlining the practical working of the Bituminous Mine Law of Pennsylvania, in respect to the settlement of dispute between the district mine inspector and the operator of a mine, regarding an order of the former.

My impression on reading the account was that it revealed a very unsatisfactory condition of affairs and one that might seriously affect the safety of the workmen engaged in the mine, to say nothing of the security of the property in question, for which, however, the operator would take his own chances, in disputing a claim of the inspector and refusing to obey his orders.

DISAGREEMENT IN OPINION WILL OFTEN ARISE

It cannot be denied that a situation in which an operator disagrees with the conclusions of a district mine inspector, concerning conditions in the mine, will often arise. If my recollection serves me rightly the outline of proceedings, described in the letter to which I have referred as the method laid down in the bituminous law, was such that a possible six weeks or more might elapse before any final decision could be reached.

In the management and operation of a coal mine, nothing is of greater importance than the safety of the workmen employed; and there should be no delay in removing any alleged dangerous condition, or in reach-

ing a settlement of a dispute that might arise regarding its existence. In this connection, I should like to point out the law laid down in the statutes of British Columbia, relating to such a situation.

The Coal Mines Regulation Act (Sec. 79, 1) reads as follows:

If an inspector, upon careful investigation, is of the opinion that a mine or any part thereof is in any respect dangerous; or that any matter, thing or practice done, followed, or permitted in, about, or in connection with such mine, constitutes a defect calculated to impair the efficiency of mining operations, or to endanger the safety of any persons in or about such mine; such inspector shall give notice thereof, in writing, to the owner, agent or manager of the mine, stating in such notice the grounds of his opinion; and shall, by the said notice or otherwise, order that such remedies be applied and such provision be made for the safeguarding of those employed in or about the mine as he thinks requisite.

If the inspector is of the opinion that any delay in remedying such matter would be dangerous he may order the closing of the mine or any part thereof, or may order the stopping of all work therein or connected therewith, until the matter complained of be remedied; and, in every such case, the inspector shall forthwith transmit to the minister of mines a copy of the order and a full report of the reasons therefor.

Any owner, agent, manager or other person refusing or neglecting to obey any order given by the inspector under this subsection shall be guilty of an offence against this act.

To prevent the abuse of this power by the inspector, however, the law (Sec. 81) provides as follows:

If the owner, agent or manager of the mine objects to any order of an inspector, under either of the last two preceding sections, he may, within twenty-one days after receipt of the notice of such order, send his objection, in writing, stating the grounds thereof, to the minister of mines; and thereupon the matter shall be settled by arbitration, in the manner provided by this act, save and except that in such arbitration the parties to such arbitration shall be the owner, agent or manager of the mine, on the one hand, and an inspector (on behalf of the minister of mines), on the other; and the date of the receipt of such objection shall be deemed to be the date of the reference.

Inquiries Of General Interest

Calculating Required Grade of Slant Road in Mine

Three Angles A, B, C Involved in the Calculation
-First Find Rise on Full Pitch, per 100
Ft.—Then Find Grade Angle for Same Rise

KINDLY explain, in the columns of *Coal Age*, how it is possible to calculate the grade of a slant road, in a seam having a given inclination, when the slant road makes any given angle with the direction of the full pitch of the seam. I have seen this method explained somewhere but have lost track of it and am anxious to know the process of easy calculation, as we have a number of such problems occurring in the mine.

Mahanoy City, Pa.

ASSISTANT FOREMAN.

The problem is a simple one and can be made quite clear by reference to the accompanying figure, which shows three vertical planes and a horizontal plane. The vertical plane $o y n$ marks the full pitch of the seam. We will assume that the rise $y n$ corresponds to the horizontal distance $o y$, equal to 100 ft.

Now, the vertical plane $o x m$ marks the direction of the slant road. The rise $x m$ is equal to the rise $y n$, since $n m$ is a strike line or level line in the seam. Evidently, the horizontal distance $o x$ being greater than 100 ft., the assumed basis of calculation, and the rise for this distance being equal to the rise on the full pitch of the seam, the slant road will have a less per-

centage of grade, or a lesser grade angle B , than the angle of pitch A .

Under the Coal Mines Regulation Act, each of the parties appoints an arbitrator, which must be done within twenty-one days. If either of the parties fails to appoint an arbitrator within that time the appointee of the other side proceeds to hear and determine the matter in dispute and his conclusions shall be final. On the other hand, should both parties appoint an arbitrator the two appointees shall select an umpire to decide on any points of difference that may arise between them. Failure of the arbitrators to agree upon the selection of an umpire gives the minister of mines the right to appoint an umpire, on the application of either party to the dispute.

Now, the point to which I wish to draw particular attention is the fact that the order of the inspector of mines stands good during all this proceeding. In other words, if I am not mistaken, the mine cannot be operated and the order of the inspector disregarded. All work affected by the order must cease, until such time as the matter in dispute has been finally decided.

There should be no hesitation in admitting that safety is the first consideration. That being true, it is right that work should cease where there is any doubt regarding the safe condition of a mine where men are employed. At the best, the work of mining coal is a dangerous occupation and should not admit of the taking of chances in questions of dispute.

Fernie, B. C.

GLEN CALDER.

centage of grade, or a lesser grade angle B , than the angle of pitch A .

The first step, then, is to calculate the horizontal length $o x$ of the slant road, corresponding to the horizontal distance $o y$ of 100 ft., in the direction of the full pitch of the seam; thus

$$o x = \frac{o y}{\cos C} = \frac{100}{\cos C} \quad 1$$

But, in the vertical plane $o y n$ corresponding to the full pitch of the seam, the rise $y n = 100 \tan A$. Again,

DIAGRAM SHOWING SLANT ROAD DRIVEN ACROSS PITCH

in the vertical plane $o x m$ through the slant road, the rise $x m = o x \tan B$; and since $x m$ is equal to $y n$, we write

$$100 \tan A = o x \times \tan B \quad 2$$

Finally, combining equations 1 and 2, we find for the value of the cosine of the grade angle C ; thus,

$$100 \tan A = \frac{100}{\cos C} \times \tan B$$

and

$$\cos C = \frac{\tan B}{\tan A}$$

In other words, the cosine of the angle that the slant road makes with the full pitch of the seam is equal to the ratio of the tangent of the grade angle to the tangent of the pitch angle.

To illustrate, let it be required to find the bearing of a slant road having a grade of 10 per cent, in a

seam having an inclination of, say 45 deg., when the pitch of the seam is due north. In this case, the tangent of 45 deg. being 1 and the tangent of the grade angle B , for a grade of 10 per cent being 0.1, $\cos C$, equals 0.1; and the slant road, therefore, makes an angle of $89^\circ 25'$ with the meridian corresponding to the full pitch of the seam. The bearing of a slant road turned to the right of the full pitch (due north) would then be N. $89^\circ 25'$ E. In this case the slant road would make an angle of 35 minutes with the strike of the seam.

Examination Questions Answered

Anthracite Foremen's Examination, Districts 3-7 incl., 1923

(Selected Questions)

QUESTION—*Explain the manner in which you would make a test for firedamp with a safety lamp.*

ANSWER—When making a test for explosive gas in a mine, the flame of the lamp should be lowered so as to cut out practically the bright luminous portion of the flame. The best results are obtained when a uniform height of flame is adopted. Holding the lamp in an upright position, it is carefully raised toward the roof or into any cavity where gas is suspected. While doing this the flame is closely watched for the first appearance of a faint blue cap surmounting the lamp flame, or any lengthening of the lamp flame, which would indicate the presence of gas. The height of the cap is an index of the percentage of gas present.

On the first appearance of any indication of gas, the lamp should be carefully withdrawn, making no quick movement of the lamp, which would tend to cause the flame of the gas burning within the lamp to pass through the mesh of the gauze and ignite the gas surrounding the lamp. When making a test in a quiet atmosphere a thin layer of gas at the roof may escape notice. To prevent this, the fireboss should blow a gentle whiff against the roof so as to disturb the gas and bring it down to where it will enter the lamp. In no case, should the lamp be tilted to one side, which would cause the heat of the flame to bear directly on the gauze and make the lamp unsafe. This is a dangerous practice of some firebosses.

QUESTION—*State the requirements of a good safety lamp for general mining use.*

ANSWER—The lamp must give a good light. It should be simple in construction, of few parts that can be assembled without danger of mistake or omission of any part, which would render the lamp unsafe for use. The design of the lamp should be such as to render it least liable to accident, fairly safe in strong air currents, light and portable. The flame should be so set in the lamp as to give a good range of illumination, upward on the roof and downward on the floor. The lamp should be provided with a lock fastening that will betray any attempt to tamper with the lock. The chimney of the lamp should be provided with a bonnet for protection against strong air currents and falling dust and dirt.

QUESTION—*What oils are generally used in safety lamps?*

ANSWER—A vegetable oil, as cottonseed, or an animal oil, as sperm or seal oil, is commonly used; except in lamps designed to burn a volatile or light mineral oil such as naphtha or benzene. The vegetable and animal oils first mentioned are the safest for common use, because they are not explosive. Greater precaution is needed when burning a volatile oil, and the vessel of the lamp must then be designed for that purpose.

QUESTION—*How should all doors affecting the ventilation in a mine be adjusted?*

ANSWER—Mine doors must be set in a substantial frame and in such a manner that they will close with the air current. The door must be given a slight fall so that it cannot stand open without being propped back. Doors controlling the main air current in a mine should be in duplicate and so arranged that when one door is open the other will always be shut. This is important in order to prevent the short-circuiting of the air when it is necessary to pass through a door separating the main intake and return airways. Besides these requirements, the anthracite law also requires an extra main door to be kept standing open where it will not be in danger of accident and can be at once closed should the door in use be destroyed from any cause.

QUESTION—*What portions of a mine would you most carefully examine in your rounds as a fireboss?*

ANSWER—Portions of the mine requiring the most careful attention on the part of the fireboss are those where danger from gas or bad roof conditions are most expected to develop. This does not mean, however, that other portions of the mine should be neglected in any manner. Where gas is being generated a good fireboss will naturally make a more careful test where he suspects gas than in places generally known to be free from gas.

QUESTION—*After passing the workmen into the mine in the morning what would be your duty as a fireboss?*

ANSWER—Upon completing his morning examination and the making out of his report in the book kept for that purpose, as required by law, and having passed the men into the mine, except those in whose places danger has been found, and having made a verbal report to the mine foreman in charge, the fireboss returns for his breakfast, after which he must start his second examination of the mine, by visiting those working places first where danger has been found. It is his duty to see that the work of removing those dangers is being performed in a safe manner and as promptly as possible. Following this, it is the fireboss' duty to visit in order every working place in his section and give the men any needed instructions in the safe performance of their work.

QUESTION—*What is dynamite and what proportion of nitroglycerine is contained in each grade?*

ANSWER—Dynamite is a detonating explosive formed by the absorption of nitroglycerine in some inert substance capable of absorbing and holding the liquid. Infusorial earth has been largely used as an absorbent. Wood meal and sawdust are also largely employed in the manufacture of dynamite. The percentage of nitroglycerine in the several grades of this explosive is generally given as follows:

Grade No. 1.....	50-70 per cent,
Grade No. 2.....	33-50 per cent,
Grade No. 3.....	27-30 per cent,
Grade No. 4.....	20-25 per cent.

Labor's Cause Safe in Hands of Coolidge, Says McMenimen

U. S. Railroad Labor Board Member, in London, Cites Official Record of New President as Showing Friendship to Labor.

BY PAUL WOOTON
Special Correspondent of *Coal Age*

LONDON, Aug. 12.—Labor will make no mistake in placing absolute confidence in Calvin Coolidge, in the opinion of W. L. McMenimen, a member of the U. S. Railroad Labor Board, who is in Europe to study certain phases of railroad operation here. Mr. McMenimen is one of the labor members of the board and is recognized nationally as one of the most capable of the country's public servants who have been recruited from the ranks of labor.

"Because of the action Mr. Coolidge took in handling the unfortunate and ill advised police strike in Boston," said Mr. McMenimen, "many think Mr. Coolidge is unfriendly to union labor, at least. Such is not the case. Prior to the police strike his record had been all that labor could desire. This applies to his entire period of public service, which included such important posts as membership in the lower and upper houses of the State Legislature, the Lieutenant Governorship and the Governorship of the state and covers his official career at Northampton.

"Shortly prior to the police strike Mr. Coolidge had attended the convention of the state section of the American Federation of Labor as the special guest of the Federa-

tion. While a member of the Massachusetts Senate he supported the full-crew bill and was among those who voted to pass it over Governor Foss' veto. As Governor he signed the forty-eight-hour bill despite the fact that the measure was opposed with unusual bitterness by the owners of textile mills and by such influential organization as the Associated Industries and the Arkwright Club. No longer ago than last August, in the course of an address before the American Bar Association at San Francisco, he declared that he would rather be known as the Governor who signed the forty-eight-hour bill than the Governor who dealt with the police strike.

"From my long contact with Mr. Coolidge I am convinced that labor can trust him to do the just and fair thing at all times."

Mr. McMenimen's intimate acquaintanceship with President Coolidge began many years ago when Mr. Coolidge was a commuter between Boston and Northampton. Mr. McMenimen was the brakeman on the train which Mr. Coolidge used. The friendship which sprang up between them then has continued since and became closer during the years in which Mr. McMenimen acted as legislative representative of the railroad trainmen at the Massachusetts capital and at Washington.

The fear has been expressed that the succession of Mr. Coolidge to the Presidency would make the United Mine Workers less anxious to submit to the President for final determination any of the matters in which they had been unable to agree in their conferences with the operators. If so stalwart a champion of labor as Mr. McMenimen, who more than any labor leader is in a position to know, is willing it would seem that the anthracite workers are not justified in fearing unfair treatment by the new President.

Industrial Court Uncovers Irregularities in Subleasing of Kansas Coal Lands

Investigation concluded recently at Pittsburg, Kan., by the Kansas Industrial Court, of the terms under which the Jackson Walker Coal & Mining Co. subleases coal land in the southeastern Kansas district developed an inclination to veer frequently from the straight and narrow. In addition to examining the leases, the court sought to trace the lands now held under lease by the Jackson-Walker company to their original owner, the Atchison, Topeka & Santa Fe R.R. Taking another tack, it also inquired into the action officials of District 14, United Mine Workers, in placing Jackson-Walker mine No. 17 on the unfair list a few days before the Industrial hearing was scheduled.

In explanation of the terms by which lessees are required to deliver to Jackson-Walker all coal produced by them on land leased from the Jackson-Walker company, or pay a royalty of 40c. a ton to sell it in the open market, C. P. A. Clough, president of the Jackson-Walker company, told the court his concern had contracted with the Santa Fe R.R. to deliver to it its entire production upon demand. Until the last year, he said, the Santa Fe had taken 85 per cent of the coal produced by the Jackson-Walker company and its lessees, and though installation of oil burners in Santa Fe locomotives had cut this demand considerably, his company was forced to protect its contract by continuing to control the output from its lands.

Firms leasing from Jackson-Walker declared the 40c. royalty made it impossible for them to compete in the open market, and, as a result, when the Jackson-Walker demand slackened they were compelled to close down.

J. H. Keefe, president of the Pittsburg & Cherokee Coal & Mining Co., from which the Jackson-Walker company leases, testified that majority stock in his concern is held in trust by the Central Trust Co., New York, for the Santa Fe R.R. Mr. Keefe also testified that \$100,000 of the \$225,000 paid by Mr. Clough for control of the Jackson-Walker company last winter was lent Mr. Clough by the Santa Fe Land Development Co., majority stock in which also is held by the railroad. Jackson-Walker stock was security for the loan, he said.

Passing to the union's placing Jackson-Walker Mine No. 17 on the unfair list, William Bogartz, president of District

14, examined relative to the union's purpose, admitted that union officials expected miners employed in the mine to cease work. This terminated the court's inquiry, but the district board withdrew its order a few days later, following a conference between its representatives and representatives of the operators, at the instigation of members of the International board.

The Industrial Court has given no date for the announcement of the results of its investigation.

World's Coal Output Higher in 1922 Despite Strike in United States

Although preliminary estimates of the production of coal in the United States in 1922 show a marked decrease as a result of the five-months miners' strike, the world's coal production of 1,208,000,000 metric tons in that year showed an increase of 72,000,000 tons, or 6 per cent, over the output in 1921, according to W. I. Whiteside, of the U. S. Geological Survey. Production in the United Kingdom has risen to the level of the early war years, and this increase counterbalances not only the falling off in the United States but that in other countries. Although Germany lost (beginning in June) about 70 per cent of the Upper Silesian coal production to Poland, so that the Polish output was about three or four times as much as in former years, the total in Germany for the year shows an increase over the output of 1920 and hardly 5,000,000 tons less than that of 1921. The Netherlands lignite industry, which in 1920 had reached an output of almost 1,500,000 tons, has now practically if not entirely ceased.

The following table shows the trend of the world's production for the last 13 years, and the percentage of the annual total produced in the United States:

Year	Production in Part Estimated	Per Cent Produced by United States	Year	Production, in Part Estimated	Per Cent Produced by United States
1910	1,160,000,000	39.2	1917	1,325,000,000	44.6
1911	1,189,000,000	37.9	1918	1,331,000,000	46.4
1912	1,249,000,000	38.8	1919	1,168,000,000	43.1
1913	1,342,000,000	38.6	1920	1,319,000,000	45.3
1914	1,207,000,000	38.7	1921	1,136,000,000	40.4
1915	1,189,000,000	40.6	1922	1,208,000,000	34.6
1916	1,257,000,000	42.7			

The term "coal" as used by the Geological Survey includes

lignite, and the production for the world is simply the total of quantities reported, no attempt being made to reduce the statistics for inferior coals to an equivalent tonnage of coals of higher rank. Where possible, however, coal and lignite are shown separately.

The preliminary statistics of the world's coal production given in the Geological Survey's weekly report No. 295 have been revised and are given in greater detail in the following table. Attention is especially called to the change in Canadian figures. The Dominion Bureau of Statistics now compiles the mineral statistics of Canada, and its figures, which differ somewhat from those published by the Canadian Department of Mines, have been used in this table, in order that subsequent figures may be comparable. The production in countries from which reports had not been received by June 6, 1923, represents only about 3 or 4 per cent of the total, and as estimates for these countries have been included, the margin of error in the total as given is perhaps not over 2 per cent. The table will be revised as final official data are received.

(a) Estimate included in total. (b) Includes the Saar. (c) Includes entire output of Upper Silesia for January-May, for June-December only that part of Upper Silesia allocated to Germany. (d) Includes for June-December that part of Upper Silesia awarded to Poland. (e) Estimated on incomplete data. (f) Exclusive of lignite from Japan (annual production of about 200,000 tons), for which estimate is included in total.

Fewer Anthracite Mine Employees in 1922

Employees in and about the anthracite mines decreased slightly in number in 1922. Final returns from the producers of anthracite to the U. S. Geological Survey (including those in the Bernice Basin of Sullivan County) show a total of 156,849 men employed, a decrease, when compared with 1921, of 1.6 per cent. The reports offer no explanation of the cause of the decrease, but it seems probable that the effect on operations of the unsettled conditions that prevailed for some time after the settlement of the general strike during the summer months must have limited for a time the number of men that could be employed. The decrease was general at mines and breakers, but owing to the demand for coal to fill the shortage brought about by the strike the washeries employed a greater number of men than in 1921.

The average number of days worked by the mines and breakers was 151, a decrease of 121 days from the record for 1921, which may perhaps be attributed almost entirely to the strike. In this respect also the washeries benefited by the shutdown of the mines, and the average number of days of operation increased from 118 in 1921 to 136 in 1922. The days worked by dredges decreased from 176 to 169. These are weighted averages that take into account the number of men employed at each individual operation.

The mines in the Lehigh and Schuylkill regions were operated almost exactly the same number of days—157 and 156 respectively—while those in the Wyoming region worked 147 days. The working time for washeries averaged 136 days, and for dredges, 169 days.

Grand Total.....	42,570	72,527	41,752	114,279	156,849	151

(a) Includes comparatively small number of washery employees who could not be separated from breaker employees.

A better measure of the effect of the great strike may be gained from the table below, which shows by regions the number of days lost through strikes and the number of men involved during 1922. It was reported that a total of 142,442 men were on strike for 138 days on the average during 1922. Part of the days lost were due to local strikes before and after the general strike, but in the main the losses were brought about by it. Computed on the basis of total employees, the average loss per man employed was 125 days.

High Lights in Governor Pinchot's Address to Miners and Operators

This controversy between the miners and the operators of the anthracite field is not a private quarrel. The general public is a party to this controversy, and its rights, as well as the rights of the two other parties, must be represented and recognized.

A shortage of anthracite means not only a huge loss of profits to the operators—not only a huge loss of wages to the miners—but it means also loss of health among millions of American families, loss of comfort, of working power and of time.

A strike or suspension such as now threatens is a public calamity, and as such every reasonable public means must be used to prevent it.

The interest of the public in the settlement of this

controversy is double. In the first place, the public wants it settled. It is utterly wrong that the people should be called upon again to bear the enormous and most oppressive burden of a shortage of anthracite coal.

The public interest demands that this controversy shall be settled, and that a suspension of anthracite mining shall be avoided. The thing is possible—and it must be done.

Settlement means that neither side can get everything it would like to have. Few people ever do in the world we live in. But the settlement of this dispute is absolutely necessary for the public safety and welfare. The public needs and must have coal, and I am entirely confident that the public is going to have it.

Governor Pinchot Assumes Rôle of Anthracite Mediator

Mine Workers Issue Strike Call—Lewis Denies Report That Bituminous Miners Will Walk Out in Sympathy — Promises Operators "Most Complete Trouncing of Their Lives"

HARRISBURG, PA., Aug. 28.—Possibility of a joint session of the delegates representing anthracite operators and miners late this afternoon or tomorrow loomed big today following a conference Governor Pinchot had with the four operators at his office at the Capitol. The Governor is holding three conferences today, and the fourth, while a possibility, would not be discussed by him.

"I have discussed the case of the operators with them this morning as I did that of the miners yesterday," said the Governor, following his talk of the situation with the four producers today. I am to see both sides again this afternoon, the operators at 4 and the miners at 2." The operators were closeted with the Governor for two hours and a half and as they left the executive department they refused to disclose anything that had transpired there. The Governor continued his reticence relative to the discussion and when asked regarding the possibility of a joint session following two separate sessions with each side, said he had nothing to say.

The presence of W. B. Colver, of the Federal Trade Commission, in Harrisburg was commented upon and the Governor said: "A number of persons with special knowledge which might be useful in the present circumstances have come to this city, some by invitation and some not. As I have said before, I will counsel with anyone and everyone I can reach who can contribute from any angle to the discussion of this proposition." The Governor said that John Hays Hammond, chairman of the Federal Coal Commission, had loaned him several experts and these here today were: W. E. Fisher, David L. Wing, R. A. Walter, F. G. Tryon and Joseph H. Willits, experts in wage scales, cost production, and other matters.

The Governor also has invited here two experts representing the trade unions and two representing the anthracite operators. These experts are working with Dr. Clyde L. King, Secretary of State. There are other experts here watching the proceedings and working with the delegates. Following the organization of the new giant power board today the experts who have been invited to attend that session will also confer with Dr. King and the federal experts.

In an effort to effect a peaceful settlement of the anthracite strike situation, Governor Pinchot of Pennsylvania on Aug. 27 addressed representatives of the operators and miners, presenting a plan for separate conferences with him at the Capitol at Harrisburg. This was agreed to by both sides at an open meeting attended by the operators and the miners and numerous state officials. The Governor at this opening session of the parley outlined the entire situation. While optimistic that a way out of the difficulty, which threatens a general strike throughout the anthracite district on Saturday, can be found, he withheld suggestions of

methods by which the impending strike might be averted.

He said he recognized the rights of both operators and miners and added that the "general public is a party to this controversy and its rights as well as the rights of the other two parties must be represented and recognized." He was acting, he said, as the representative of the Commonwealth and in his capacity as Governor.

The operators at the conference were S. D. Warriner, president of the Lehigh Coal & Navigation Co., Philadelphia; W. J. Richards, president of the Philadelphia & Reading Coal & Iron Co., Pottsville; W. W. Inglis, president of the Glen Alden Coal Co., Scranton, and A. B. Jessup, vice-president of the Jeddo-Highland Coal Co., Jeddo. For the miners there were present Thomas Kennedy, Hazleton, president of District No. 7, United Mine Workers; C. J. Golden, Shamokin, president of District No. 9; Rinaldo Capellini, Hilldale, president of District No. 1, and Philip Murray, Pittsburgh, international vice-president of the United Mine Workers, representing President John L. Lewis.

At the opening session there were present in addition to the authorized representatives of the operators and miners other operators and other mining officials, statisticians and representatives of several scale committees.

The first of the separate conferences was held Monday afternoon, when for three hours the Governor went over the situation in great detail with the representatives of the miners. At the conclusion of this session the Governor announced that a second conference would be held the following day, after he had conferred with the operators. These latter met with the Governor Tuesday morning from 9 a.m. until noon.

Wholly apart from the Governor's public statement and the meeting with the miners' leaders in his chambers, was a session of more than twenty federal, state and local experts at which the practical details of a possible compromise were being worked out.

The Governor in effect is forming his own "fact-finding commission" in an effort to hammer out a practical solution and avert a strike which is but three days away. It is rumored generally that a wage increase of from 5 to 10 per cent will be suggested as the first essential to a compromise settlement.

John L. Lewis, International president of the United Mine Workers, on Aug. 27 transferred his headquarters from Atlantic City to the Bellevue-Stratford Hotel, Philadelphia.

With the selection of Governor Pinchot as mediator by President Coolidge, negotiations between the anthracite operators and miners' representatives took a new turn. Early in the week the subcommittee of operators and union leaders had discontinued their conferences at Atlantic City

because of their failure to agree on the wage demands and the refusal of Mr. Lewis and his associates to accept arbitration of all eleven demands.

At about the time that the appointment of Governor Pinchot as mediator was announced, it was made public at Atlantic City that a statement would be transmitted to the union locals in the coal fields not later than Aug. 28 "containing the rules governing the suspension that automatically will take place on Sept. 1."

The announcement from the miners that plans had been ratified for the suspension of work on Sept. 1 was made by Vice-President Murray. It read:

"The full scale committee met this afternoon and discussed the breaking off of negotiations with the anthracite operators. The committee instructed the subcommittee to prepare a statement containing the rules governing the suspension that automatically will take place Sept. 1.

"This statement will be printed and sent to the local unions in the anthracite coal fields not later than Tuesday of next week and will cover all men, including maintenance men, members of our organization employed in and around the anthracite coal fields.

"The statement will provide specifically, however, that maintenance men be continued at work, provided the anthracite operators invite the mine workers to confer to make a satisfactory agreement governing these men.

"This is the first time in the history of joint relationship that negotiations have been broken off and the operators have not requested the mine workers to supply them with maintenance men. It is not the purpose of union mine workers to furnish the anthracite operators with maintenance men after Sept. 1 unless they ask for them and are willing to make a satisfactory agreement governing their conditions of employment.

"In years gone by we have always effected a joint understanding governing the employment of maintenance men during a suspension."

James Marks, vice-president of District No. 2, United Mine Workers, had a conference with President Lewis at Atlantic City on Aug. 23, which gave rise to reports that it was probable that the bituminous coal workers would go out on strike in sympathy with the anthracite workers. This was later denied by Mr. Lewis, who declared that the union never breaks a contract.

It was hoped that when the anthracite operators and union leaders resumed their wage conferences at Atlantic City on Aug. 20 they would make progress toward a settlement of their differences on the demands of the mine workers. Two days was spent in deliberations and then, failing to agree, another adjournment was taken and the secretary of the joint committee of operators' and mine workers' representatives was instructed to notify the U. S. Coal Commission of the failure to reach an agreement.

After the adjournment on Aug. 21, John L. Lewis promised the operators "the most complete trouncing of their lives." Mr. Lewis said the break resulted from the operators' refusal to consider a wage increase while the operators said the miners' refusal to agree to arbitration was the cause.

Operators' and miners' representatives at the reconvening of the conferences on Aug. 20 immediately took up the demand for an advance of 20 per cent for contract workers and \$2 a day for day workers. Mr. Lewis stood firmly for the increase while Mr. Warriner, for the operators, as strongly opposed it, saying it would mean higher prices.

After adjournment on Aug. 20 Mr. Lewis declared the miners got no satisfaction from the operators and made it plain to the newspapermen that they had not receded from their position on the check-off.

The demand for an increase in wages was renewed at the session the following day, and when it was refused by the operators the latter offered a resolution for the renewal of the present contract to expire March 31, 1925, which was refused by the miners. This was followed by a resolution by the operators offering to submit all eleven demands to arbitration and that the findings be retroactive to Sept. 1, which likewise was voted down by the miners. A motion by the miners to adjourn was rejected by the operators.

GOING UP?

From the New York World

The operators then submitted a resolution that the secretary be instructed to advise the U. S. Coal Commission of the status of the negotiations, and that the sub-committee hold itself in readiness for consideration of such suggestions as they may make. The miners voted "no" on it, but a resolution directing the secretary to notify the U. S. Coal Commission of the status of the negotiations and that the committee adjourn to meet at the call of the secretary was unanimously adopted.

Experts Gather Facts for Pinchot

Facts in connection with points at issue in the anthracite wage dispute are being gathered for Governor Pinchot under the direction of his confidential adviser, Secretary of State Clyde H. King, formerly professor of economics of the University of Pennsylvania. Those who are furnishing information to the Governor include W. B. Colver, Robert W. Bruère, director of the Bureau of Industrial Research of New York; Royal S. Meeker, former Commissioner of Labor Statistics of the U. S. Department of Labor and recently head of the Labor Bureau of the League of Nations at Geneva; W. Jett Lauck, economic adviser to the railroad brotherhoods and to the mine workers; the Right Rev. Michael J. Hoban, Roman Catholic Bishop of Scranton; William Rauschenbusch, author of a book on coal; Joseph J. Walsh, Secretary of the State Department of Mines, and F. G. Tryon, Samuel W. Tater and David L. Wing, statisticians in the employ of the U. S. Coal Commission.

C. L. Poston Dies After Long Illness

Clinton L. Poston, aged 76, a well-known Ohio coal operator died Aug. 23 at Athens, Ohio, after an illness of more than three years. He was one of the last of the old-time operators who amassed a fortune in the coal fields of the Hocking Valley. He was born at Nelsonville in 1847 and was the son of L. D. Poston, who was interested in coal lands for years. After attending the Ohio State University, in 1867 he took charge of business for his father until 1873, when he and his brothers formed a partnership under the name of Poston Bros., to conduct the mining business. In 1881 his brothers sold out and in 1893 Mr. Poston purchased the interests of the outside partners. He was actively connected until 1902, when he relinquished a number of his activities. Later he became interested in Pittsburgh No. 8 field under the name of the Morris-Poston Coal Co., and still had interests in that field at the time of his death.

Wadleigh Gives Governors His Emergency Plan For Coal Distribution

Representatives of the Governors, among them several Governors themselves, of eleven anthracite-consuming states met in New York on Tuesday, Aug. 28, at the invitation of Federal Fuel Distributor Wadleigh, to discuss the best means of handling the emergency in the event that the anthracite mine workers go on strike Sept. 1. Among the Governors present were Cox, of Massachusetts; Flynn, of Rhode Island, and Proctor, of Vermont. General Goethals represented Governor Smith of New York. Interstate Commerce Commissioner Aitchison sat with Mr. Wadleigh, who presided as chairman.

Mr. Wadleigh opened the meeting by telling the Governors of the limitation in the powers of his office, and that the act creating the Federal Fuel Distributor provided that such powers as it conferred shall not extend beyond Sept. 22, 1923. The so-called Brydon plan of emergency distribution of soft coal was discussed and it was pointed out by Mr. Wadleigh that in one important aspect the soft-coal operators' proposal is not feasible. The Brydon plan contemplates that the government set the prices at which bituminous coal shall not be sold during the emergency. The Federal Fuel Distributor or no other federal agency has power to fix the price of coal.

After some discussion of the possibilities of working out some plan the soft-coal operators were invited into the meeting. Mr. Brydon informed them of the plan which he had worked out, which in brief contemplates that so far as possible the ordinary channels of distribution shall not be disturbed, and that an emergency supply of coal would be obtained through a special organization that would have representatives in each anthracite-consuming state to act in conjunction with the state authorities and consumers. He announced that S. L. Yerkes, of Birmingham, would be asked to take general direction of production and distribution.

Mr. Brydon called particular attention to the fact that his emergency plan is designed to deal effectively with a serious emergency where the ordinary channels of purchase and distribution prove insufficient for the effective supplying of the needs of the public, and is predicated "on the government determining that there existed such an actual or threatened shortage in the supply that it was desirable to fix prices by governmental action rather than leaving them to the ordinary processes of competition." He added: "Under existing laws no emergency organization of the operators can itself undertake to agree on or fix prices even for the purpose of keeping prices down in the absence of governmental co-operation. Therefore, until the government may deem the emergency such as to justify it in fixing prices by the method used during the strike of 1922, or otherwise, or will give its sanction to some other method, it would be impossible for any emergency organization of operators itself to receive and place orders for the purchase of coal."

The assistance of the soft-coal operators was offered to the Governors, to wholesalers, retailers and consumers by way of giving information as to the use of soft coal as a substitute for anthracite and the sources of available supply.

Representatives of the petroleum industry were present, and Mr. Welch, secretary of the Petroleum Institute, read a prepared statement pointing out the advantages of oil for household heating. He suggested that the larger homes be equipped with oil-burning apparatus, leaving the supply of anthracite available to those who could not afford the high initial cost of installation. He refused to make any prophecy as to the future price of oil and stated that on present costs of coal and oil material savings in operating expense would be realized by those who use oil.

Several of the state representatives asserted that retail dealers are exceedingly reluctant at this time to buy bituminous coal because of the fear that if there is no strike they will be left with the soft coal in their yards and that eventually they will have to sell it at a loss.

There was spirited debate toward the close of the session between Mr. Ainey, representing Governor Pinchot of Pennsylvania, and Mr. Maloy, representing the Governor of Maryland, as to the proper form in which the assembled Governors and their representatives should express their willingness to co-operate with the Federal Fuel Distributor.

The resolution finally adopted by state representatives, which summarized the results of the meeting, simply pledged state governments to co-operate fully with the Federal Fuel Distributor in whatever plan he should propose, should the necessity for emergency action arise.

The meeting was held in the office of the Port Authority, No. 11 Broadway, New York, and at the outset the press and representatives of the coal trade were excluded. Railroads were represented by their coal traffic managers.

Commission Appraises Hard-Coal Situation

The Coal Commission on Aug. 24 issued a statement summarizing the situation with respect to supply and stock of anthracite and appraising the condition of the country in the event that there is a prolonged strike in the hard-coal fields. The statement follows:

"In the first place, the anthracite mines to date have maintained so high a rate of shipment that by Sept. 1 over 25,000,000 net tons of domestic sizes of anthracite will be in the possession of the consumers or dealers. This supply, representing shipments from April 1 to Aug. 31, is over 7,000,000 tons more than was distributed by Dec. 31 last year and only about 17,000,000 tons less than the average supply on Dec. 31 of the three years previous to the strike year.

"Any complete stoppage of anthracite mining on Sept. 1 would thus involve a deficit of 17,000,000 tons of domestic sizes to be made up before the end of December, or a million tons a week. Indeed, with the present high rate of shipments continuing through this month, the supply on hand would be nearly 2,500,000 tons above the average on Sept. 1, and a real deficit would not exist until after two weeks of shutdown. To that degree is the anthracite-consuming territory prepared to face the threatened strike.

"However, the Sept. 1 stocks of household fuel are not equally distributed and the many households without any anthracite would be forced to prepare for winter by accepting some substitute.

"While, as was true last winter, some byproduct and bee-hive coke will be available, perhaps at a rate of from 100,000 to 200,000 tons a week, the principal substitute must be bituminous coal.

"To sum up the situation: In the event of an anthracite strike, a household fuel emergency would exist in the Eastern United States which the bituminous operators believe could be promptly met by utilizing the excess mine capacity of the bituminous fields normally shipping steam coal to New England, Canada and the Atlantic seaboard. The united effort of soft-coal operators, railroad executives and the Interstate Commerce Commission would probably be in the line of starting this movement of coal before the period of maximum freight movement, for which the railroads are reported to be in excellent condition to handle.

"Stoppage of anthracite mining would be a public emergency to meet which would require the full co-operation of the consumers with the soft-coal operators and all the agencies of distribution, with all the aid possible through executive action by federal and state governments. If those who now control the mining and distribution of anthracite are to continue to think only of their own demands and not at all of the public's demand for coal, the Coal Commission feels that every measure should be taken to supply the domestic fuel needed in the homes of the great mass of the consumers and especially of the industrial workers throughout the East."

Coming of Hodges Recalls Reported Co-operative Strike Agreement

Frank Hodges, secretary of the Miners' Federation of Great Britain, according to a newspaper dispatch, is on his way to Canada, and later will confer with John L. Lewis, president of the United Mine Workers of America, and his associates in Indianapolis. When Lewis recently visited Europe he saw Hodges and shortly after the former's return to the United States it was reported that an agreement in principle had been reached between the two leaders to co-operate in the event of a strike in either country. In view of the wage negotiations now on between the anthracite operators and miners Mr. Hodges' visit at this time has an added significance.

Soon after Mr. Mr. Lewis' return from Europe he was a witness before the U. S. Coal Commission but gave no intimation that there was an agreement between Mr. Hodges and himself. At about the same time Attorney General Daugherty, whose attention had been called to the newspaper articles, sent a letter to the U. S. Coal Commission stating that it would be a violation of the laws of this country if the alleged agreement, whereby British coal diggers would not mine coal for shipment to the United States during a strike here and whereby the American union would conduct itself similarly during a strike in the British Isles, had been entered into.

FRANK HODGES

Enjoin Roads and I. C. C. in Joint Mine Case

The U. S. District Court for the Southern District of West Virginia has granted a permanent injunction against the Chesapeake & Ohio R.R., the Virginian Ry., the United States of America and the Interstate Commerce Commission in Equity No. 1276, commonly called the Joint Mine Case. The decision restrains the carriers involved from putting into effect the Interstate Commerce Commission decision which provided that joint mines could not obtain more cars than local mines. The Court says the restraining order is only meant to hold that circular CS-31, Rule 4 (Revised) is erroneous and the action of the carriers in putting it in force must be enjoined and that an order will be entered without prejudice to the Interstate Commerce Commission making proper orders relative to reasonable car distribution to joint as well as local mines not in conflict with the Court's view, which is that the Commission's decision is not in accordance with the law. The Interstate Commerce Commission intends to appeal the court's ruling to the U. S. Supreme Court.

Federal Bureaus at Variance on New Mine

Considerable interest has been aroused in Washington by the conflict between the attitudes of the Interstate Commerce Commission and the Interior Department toward opening new coal mines. The commission recently denied the Virginian Ry. permission to build a branch line 1.19 miles in length in Wyoming County, W. Va., to reach a proposed coal mine, saying at one place in its decision: "There are at present more mines in the country than is consistent with the most efficient use of carriers' equipment, and their aggregate capacity exceeds greatly the country's demand."

The Commission asserted that the Virginian Ry. had not been able to give a sufficient car supply to the mines already operating along its lines and dependent upon it.

While one government agency thus gives what appears to be a general declaration that too many coal mines are in existence in the country, the Department of the Interior has announced the sale at public auction of mineral rights to 1,840 acres of public land in Fayette County, Ala. The coal rights were purchased by Moss & McCormick, of Birmingham, who paid a cash bonus of \$85,000, with a pledge to spend \$75,000 for improvements on the property within three years and to guarantee the government a royalty of 10c. per ton per annum on a minimum production of 20,000 tons of coal, the stipulations meaning that the coal must be mined.

J. H. Barnes Sees Menace to Fundamental Of American Industrial Relations

Julius H. Barnes, president of the Chamber of Commerce of the United States, issued a statement Aug. 26 on the anthracite situation, declaring that the public will place the blame and condemnation upon the party which refuses to submit their cause to determination by an impartial tribunal. "The coal situation, to my mind," said Mr. Barnes, "has assumed unusual importance because in its present aspect this question has assumed a challenge to a fundamental principle of American industrial relations."

"Now, if it is true that in this dispute there has been on the part of the operators an unreserved offer to submit the questions to impartial arbitration, and if that offer has no conditions which tend to render it unfair or partial in any degree; and if that offer has been flatly refused, then we are, as I said, to the point of a challenge to the principle on which organized society preserves its orderly existence. There has developed, moreover, a feeling that the public has an interest in the settlement of wage disputes and of relations between workers and their employers on such a scale as this such as has not been generally recognized."

"It is now realized that a settlement which grants unfair demands on either side and is reimbursed by a public price levied on every consumer is not a fair settlement, in an article of such common use and of such a character as to assume almost the character of a monopoly. Therefore there is an unusual significance in the direct issue, stripped of all other technicalities, as to whether, in this great industry, the question of the relations between workers and employers is to be subject to the determination of an impartial tribunal, in which the public interest also will be considered, or whether one side or the other shall impose its will brutally upon the other, and the public pay the cost."

"Here is no attempt to weigh the merits of the case, one side or the other, but an attempt to define to the public the clear issue in this case: Shall an industrial dispute, when all other means of conference and discussion have failed, be submitted to the determination of unprejudiced tribunals, or shall the public see its interest jeopardized by a contest of violence and relative strength? In such a case the public, having learned the facts, will attach the blame and visit their condemnation, effective or futile as it may later prove to be, upon the party which refuses to submit their cause to such determination."

Let Coal Contracts for Ohio Institutions

The Ohio Board of Purchase has awarded contracts for 73,900 tons of coal for seventeen state institutions. The awards, based on bids submitted about a month ago, cover 23,900 tons of mine-run at prices ranging from \$1.63 to \$1.79 per ton. The awards on mine-run were made on nine lots, the smallest 900 tons, three lots of 2,000 tons, two lots of 2,500 tons, three lots of 4,000 tons.

Awards also were made for 50,000 tons of nut, pea and slack. The lowest figure was \$1.01 per ton on 6,000 tons. There were 19,000 tons awarded at \$1.10, 2,500 tons at \$1.14, 5,000 tons at \$1.18, 6,000 tons at \$1.19, 3,000 tons at \$1.25 and 6,000 tons at \$1.45. All but two of the companies obtaining the awards have headquarters in Columbus.

Still Hopeful of Peace in Anthracite Field, Washington Prepares to Provide Substitutes if Necessary

Entrance of Governor Pinchot into the anthracite situation came Aug. 24, when the Pennsylvania executive reached Washington and lunched with President Coolidge. Chairman Hammond of the Coal Commission also was a guest. The Governor made it plain that he had come as the result of an invitation. At the White House it was stated that the federal government was abandoning nothing to the state in this movement, but that the object was co-operation between the state and the federal governments. It was reported, without confirmation, that Secretary Hoover had suggested that the Pennsylvania Governor be asked to see what he could do to restore harmony, anthracite production being almost wholly within that state. To assist the Governor at his conference with the operators and miners at Harrisburg, the Coal Commission sent to that city F. G. Tryon and several others of its staff.

Official Washington entered the last week of August outwardly optimistic that there would be no cessation of work in the anthracite mines at the end of the month, when the existing agreement will expire, but confessedly basing this feeling upon deduction and not upon assurances from those connected with the production of hard coal.

While hopeful of peace in the anthracite fields, preparations went forward to provide communities which normally consume anthracite with substitutes in the form of bituminous coal and coke in the event that work in the anthracite collieries should cease Sept. 1.

Eyes were turned expectantly Monday toward Harrisburg, where Governor Pinchot was scheduled to meet representatives of the anthracite miners and operators in an effort to bring about an agreement whereby anthracite production would not be interrupted.

WADLEIGH TO MEET GOVERNORS IN NEW YORK

F. R. Wadleigh, Federal Fuel Distributor, left Washington Sunday for New York, where he had invited governors of Eastern anthracite-consuming states to meet him, in person or through representatives, Tuesday to discuss plans for sending into those states soft coal and coke in the event that shipments of anthracite should cease.

According to Mr. Wadleigh's invitation, which was issued August 22: "An important subject to be discussed will be the matter of education of the consumer in the use of fuels other than anthracite, as it is felt that a systematic plan of public instruction can be made of great service in the practical and efficient use of such fuels and will thereby reduce the actual cost of heating, with resultant savings to the individual consumer and the community." In this connection attention has been directed to "Comparative Tests of By-product Coke and Other Fuels for House-Heating Boilers," by Henry Kreisinger, John Blizard, H. W. Jarrett and J. J. McKitterick, which was issued as Technical Paper No. 315 of the Bureau of Mines, last May.

The termination of the Atlantic City conference between representatives of the anthracite operators and miners Aug. 21 after only two days of a resumption of negotiations following the meeting with the Coal Commission served somewhat to lower the optimistic feeling in Washington, but did not destroy it. John Hays Hammond, chairman of the Coal Commission, immediately reported to President Coolidge, and has been in daily conference with the President since.

Members of the Coal Commission felt that they had nothing further to offer toward bringing together the anthracite groups, having laid the situation before the two sides at the New York meeting. It was stated by Chairman Hammond that the promised report fixing responsibility as between the operators and the miners probably would not be submitted to the President until after Aug. 31, in the event that there was continued failure to reach an agreement.

Nowhere in official Washington was weight given newspaper speculation as to the possibility of a walk-out in the

bituminous fields which are unionized in the event of cessation of operations in the anthracite fields. This speculation is minimized in Washington. It was pointed out, for one thing, that a strike of soft-coal miners would be unauthorized by the United Mine Workers of America, in the face of their contract in the bituminous fields, which does not expire until next April, and that men ceasing work under these circumstances would not receive strike payments from the union treasury.

At a conference of members of the Coal Commission with newspaper correspondents Friday, Chairman Hammond made a detailed statement of the reasons which he said caused him to feel optimistic over the situation.

Summed up, these are that a cessation of operations would prove costly to the operators, because their mines would have to be maintained in readiness to resume work whenever an agreement should be reached, while the market for their product for at least this winter would be destroyed, and possibly much of it taken away permanently by substitutes, while for the miners there would be unemployment during the period the mines were not producing, with possibly a reduction of employment thereafter if the market for anthracite were injured, as expected.

"But," said Chairman Hammond, "before the world war all intelligent men said that such a war would be impossible; yet it came. And I have known intelligent men to run amuck and I have known intelligent men to commit suicide."

Former Vice-President Marshall called attention to the fact that the price of anthracite has reached almost the breaking point, and that it is already a "luxury fuel."

Commission members stated that by Sept. 1 there will be in consumers' bins or in the hands of dealers 25,000,000 tons of domestic sizes of anthracite and that a supply of 1,000,000 tons of substitutes weekly will maintain the situation until Dec. 31. Unfortunately, Chairman Hammond stated, the supply in consumers' bins is not evenly distributed, so that the lack will fall most severely upon the poor who have not been able to lay in their stocks.

Competition, if nothing else, will keep the price of substitutes from mounting to dizzy heights, Chairman Hammond said. Bituminous coal mines have been operating only about 60 per cent of capacity, owing to lack of market, and the operators probably would be glad of an opportunity to increase this percentage at the same margin of profit.

Julius H. Barnes, president of the United States Chamber of Commerce, issued a statement Sunday pointing out that the anthracite miners have rejected arbitration offered by the operators, which, he said, was "a challenge to a fundamental principle of American industrial relations."

The Coal Commission last week made public a report on "Cost of Production of Anthracite Coal," by David L. Wing and James E. Black, of its staff, the data having been used in a previous report by the Commission.

Searles Opposes Soft-Coal Emergency Plan

Ellis Searles, editor of the *United Mine Workers Journal* and personal representative of John L. Lewis, International president of the miners' union, has made an oral statement to John Hays Hammond, chairman of the United States Coal Commission, which is understood to have been in opposition to the bituminous operators' plan to supply the nation's fuel needs in an emergency such as would be brought about if the anthracite miners go on strike next month. No statement was forthcoming from the Commission on the matter.

ON ORDER OF THE DEPARTMENT OF THE INTERIOR the use of black blasting powder has been entirely discontinued in the Matanuska coal field in Alaska. Explosives listed as permissible by the Department of the Interior have been substituted in all operations.

Production and the Market

Weekly Review

Despite the uproar in the press over the possible effect of an anthracite strike on the bituminous-coal market, there is as yet little evidence of any effect on prices. It is true that throughout the Middle West the usual autumn buying of domestic soft coal has begun several weeks earlier than usual, but whether this is due to the threatened hard-coal strike or to a week of unusually cool weather in August is not clear.

Prices of soft coal advanced slightly here and there last week, and producers and shippers are talking about still higher prices for September deliveries. *Coal Age* Index of spot prices of bituminous coal at the mines advanced to 202 on Aug. 27 compared with 197 the previous week. The corresponding average price was \$2.44, a gain of 6c. in the week. The steam-coal market picked up in sympathy with the domestic grades west of the Alleghanies and in Pittsburgh. Practically every market, except New England, registered some degree of improvement in inquiry and buying. Where prices did not actually advance the market stiffened up with very little coal available at the lower prices quoted.

OUTPUT GAINS; TRANSPORTATION HOLDS UP

Production is increasing and unless car shortage develops the higher rate of output will soon flatten out the better prices that are in prospect. There are practically no reports of transportation shortage or difficulty in delivery of either hard or soft coal. There is less distress coal in every market and accumulations of "no bills" are disappearing. The market for smokeless is better in the West and has slumped notably at tide, mainly because New England is not buying.

The Lake movement is slowing up because the docks are nearly full of coal. The total Lake movement of bituminous coal to date this year exceeds any previous record for a like period of time. The total dumpings to Aug. 20 were 17,877,000, exceeding by more than 2,000,000 tons the record of 1921.

New England has been taking coal at a high rate this

year, the record showing 127,000 cars shipped all rail into that market from Jan. 1 to Aug. 18, exceeded only by 1918 and 1920. The water movement to New England in the first seven months of this year was 7,267,000 gross tons, exceeded for a like period only in 1918. Buying of soft coal in New England is now only in small tonnages and there is only lukewarm inquiry for coal next month. Constant pressure is required to induce customers to take monthly quotas on contract. The railroads in New England are now receiving the bulk of the soft coal.

Production of anthracite dropped off about 200,000 tons in the week of Aug. 18 but passed the 2,000,000-ton

LAKE COAL DUMPED
(Net Tons)

	Week Ended Aug. 20	Season to Aug. 20
Cargo	935,882	16,955,167
Fuel	54,022	859,828
Totals	989,904	17,814,995

mark again last week. It is estimated by the government that more than 25,000,000 net tons of domestic sizes of anthracite will be in the hands of consumers or dealers by Sept. 1. This supply is some 7,000,000 tons more than was distributed by Dec. 31 last year and only about 17,000,000 tons less than the average supply to Dec. 31 in recent years. A strike of the anthracite

miners on Sept. 1 would thus leave a deficit of about 1,000,000 tons a week to be made up by substitutes, of which coke would furnish between 100,000 and 200,000 tons per week and bituminous coal the remainder.

Prices of furnace and foundry grades of beehive coke are up 25c. this week. The sharp recovery in the beehive coke market in the past three or four weeks is due to production and consumption being again in adjustment, if indeed production is not somewhat short of consumption. In July furnaces were blowing out, and ovens were not blown out quick enough, leaving some stocks to be absorbed and temporarily depressing the market. Apparently consumption is now equal to absorbing both the stocks and the current production.

Chicago Short of Smokeless

Conditions have changed for the better around Chicago. There are plenty of orders for every size domestic coal. Prices are holding firm to the circular and "no bills" are being rapidly cleaned up. Screenings also show im-

provement. West Virginia smokeless is becoming scarce in this city and Illinois and Indiana domestic sizes as a result are readily bringing the circular prices. Central Illinois domestic coal is in fair demand and western Kentucky is gaining in price.

No anthracite is now reaching Chicago and the present stocks will not last more than two weeks under normal conditions. Consumers are reconciling themselves to the fact that there will be a shortage of anthracite should there be no strike, and are considering substitutes.

Production is a little better than a week ago in the Southern field, following last week's evidence of a revival in the market. Central Illinois showed no material improvement, however.

There is no change in the Mt. Olive field. Production is low and demand has shown little improvement. Operators generally are carrying large amounts of no-bills and prices on domestic sizes range \$2.75@3.25 with steam egg quoted at \$2.25, steam nut \$2, mine-run \$2.20 and screenings \$1.35. In the Standard field an improvement in demand for domestic sizes is noted, but some operators are experiencing difficulty in moving steam sizes.

* Net tons, f.o.b. mines.

† Advances over previous week shown in heavy type, declines in italics.

This diagram shows the relative, not the actual, prices on four-teen coals, representative of nearly 90 per cent of the bituminous output of the United States weighted first with respect to the proportions each of slack, prepared and run-of-mine normally shipped, and second, with respect to the tonnage of each normally produced. The average thus obtained was compared with the average for the twelve months ended June, 1914, as 100, after the manner adopted in the report on "Prices of Coal and Coke, 1913, 1918," published by the Geological Survey and the War Industries Board.

St. Louis Has No Interest in Strike Talk

Owing to cooler weather and more favorable unloading conditions, dealers are finding it easier to move their tonnages with a slight increase in the domestic demand. As usual, this early demand is for southern Illinois domestic sizes. The threatened strike in the anthracite fields has had no effect on the demand for anthracite in the St. Louis market. Dealers are well supplied, in view of which late buyers are showing little or no interest in the matter of their supply. Very little demand for smokeless or coke has appeared locally. There is an increased demand from country points for both southern Illinois and Standard coals with no change in local retail prices.

The fall season is making itself felt on the western Kentucky market. Operators are holding prices more firmly and there is a marked reduction in distress coal.

Louisville Market Unsettled

Guessing as to future conditions, especially as to the effect of the anthracite situation, if a strike materializes, has disturbed this market. A lot of operators, claiming to be sold up for a week or ten days, are not especially in need of business, and are only quoting the high side of the market quotation range, and in some cases adding 25 to 50c. to even that price for September delivery.

It is reported on good authority that some of the operators in southeastern Kentucky, in the Straight Creek and Jellico fields are quoting \$3.75@\$4 a ton on prime block coal, but \$3.50 appears to be the top of the market on such coal in the Louisville district, and not much block from eastern Kentucky is selling above \$3.25, with some sales made at around \$3. Western Kentucky prices are firmer on the local market, and as some operators are fairly well sold up, quotations are firmer. Industrial buying is better, especially in the South.

Soft Coal Declines in Northwest

The rush for anthracite which has been on in the Northwest for some time has finally spread to the cities, which have been quite backward until lately. The hard-coal situation is fairly satisfactory in the Twin Cities. There has been received this season at Lake Superior ports in the neighborhood of 800,000 tons of hard coal—perhaps two-thirds to three-quarters of an ample supply for a full winter, depending on its severity.

The fight for business has brought about some very low figures on Illinois coals, and the quotations named are more or less nominal, ranging from around \$3.50 down to \$3 at the mine as the exigency seems to require. Kentucky coal is going into the local market on the same policy of "get the business," with prices even lower than the Illinois figures.

The anthracite market is active in Milwaukee, for if there is a strike Milwaukee faces the prospect of pulling through the coming winter with only half of its normal supply of hard coal. There is anthracite on the docks for six weeks or two months under normal demand, but a general rush of orders would soon wipe out the supply. Receipts of soft coal by lake are slowing down, due to the fact that there is little storage room left on the docks.

Cargo receipts at Milwaukee up to date aggregate 575,710 tons of anthracite and 1,755,920 tons of soft coal. These figures match up fairly well with the receipts during the corresponding period of 1921. The outlook is that the docks will go into the winter with more than a normal supply of soft coal and more than enough to meet any deficiency in anthracite.

Soft-coal prices have taken another drop at Duluth. Prices of Youghiogheny and Hocking, which are indicative of the general trend, are off \$1 from the opening price this year. Pocahontas is off \$2. Anthracite holds firm and is in much demand.

Screenings are a drug on the market. Dock men are not anxious to hold them any longer than necessary and buyers feel that there may be further reductions before the weather gets really cold. There is much interest in substitutes for hard coal and a demand is evident for Pocahontas.

The Southwestern market continues steadily, if somewhat slowly, to improve. Few mines closed early in the summer have been reopened, but those that were kept in operation through the summer are working three days a week.

Utah operators are gaining steadily on working time, now averaging three days a week. Prices remain the same as last week. Slack is moving at a fair pace and bringing an average of \$1.25 at the mine. Utah production in July was 355,000 tons compared with 374,934 in that month last year.

Strike Talk Stiffens Cincinnati Market

Strike talk and a blast from John L. Lewis seem to breathe more strength into the Cincinnati market than any other known invigorative. Within the past week there has been a general righting of sails and business took on the biggest spurt of activity since last March or April.

There have been material advances in prices by operating companies who are filled up with business for August and who are going slow about taking on more business than can be cared for in the next couple of weeks. Slack showed the best improvement of the bituminous while domestic lump also has picked up.

River business has been favored by rains but artificial means to get the barges down is still in use. With the exception of slack there has been no change in Cincinnati

retail prices—which are: Smokeless lump, \$10.50@11; mine-run, \$7.75@8.25; bituminous lump, \$7.50@8.50; slack, \$5@5.50.

Production in the Hocking, Cambridge, Jackson and Pomeroy fields is about 20 to 25 per cent. The No. 8 field, on the other hand, made a new record for a week's production with 460,000 tons the week ended Aug. 18, which is about two-thirds capacity.

Transportation facilities continue ample, cars being available to the extent that they are ordered—practically a 100-per cent car supply. No market as a factor is diminishing.

Bituminous coal receipts at Cleveland during week ended Aug. 18 show a slight decrease from the preceding week, which was heavy. Total arrivals were 1,812 cars, divided 1,299 for industries and 513 for retailers.

Coke Prices Advance

On a general average in the Pittsburgh field mine-run and lump steam and gas are up about 10c. in the week, with steam slack up 5c. and gas slack no stronger. Youghiogheny gas lump, quotable up 15c. last week, has advanced about 10c. more to a range of \$2.85@\$3. At the moment most of the business is going at close to \$2.85. Gas mine-run is quotable at \$2.40@\$2.50, or 5c. advance, while gas slack is \$1.50@\$1.60 and not overly strong at that, so that if anything gas slack has weakened. Steam mine-run, quotable lately at \$2.00@\$2.15, with but little doing at under \$2.10, is now fairly steady at \$2.15@\$2.25. While the advance on paper is 10 to 15c. the increase in average realized prices at 5@10c. Steam lump is slightly higher, at \$2.40@\$2.50. Steam slack is quotable again at \$1.30@\$1.40, having recovered the 5c. loss reported a week ago.

The spot coke market has advanced about 25c. in the week. Furnace coke, quotable a week ago at \$4.50@\$4.75, according to grade, is now at \$4.75 as minimum, with a number of sales known to have been made at \$4.90 and conjectures that \$5 had been paid in a few cases, while the usual asking price is \$5.

Interest Lukewarm in New England Market

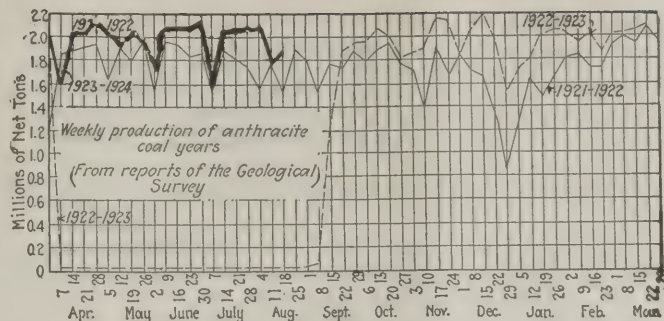

The prospect in New England for screened coal is not encouraging. Accumulations at Hampton roads are heavier than at any time since June and quotations are softer than even a week ago. No. 1 Navy standard coal has sold down to \$5 per gross ton f.o.b. vessel, and while there were sales early in the week at \$5.25 the range is now \$5@\$5.15. Pool 2 coals have sold within a few days at less than \$5.

Practically all the shippers from central Pennsylvania need business for September and while there is little disposition to operate at less than cost there is reason to suppose that distress coal may soon put in an appearance at the New York and Philadelphia piers. The railroad terminals already have on hand more coal than loading orders call for and a marked falling off in tonnage is expected.

In connection with a possible anthracite tie-up much is being said about the use of bituminous as a substitute, but in this territory it will take a real emergency to induce even the dealers to take on any considerable reserve supply.

East Buys Welsh Anthracite

Inquiry for Welsh anthracite is growing and orders have been placed for New York delivery at close to \$12 New York harbor. One English firm reports having booked orders for about 100,000 tons of Welsh anthracite to points along the

Atlantic seaboard from Newfoundland to New York for shipment during September, October and the early part of November. Orders for shipment later than the early part of November have been refused. The largest portion of the tonnage already booked has been for Boston interests. Other shipments were reported as having been booked for New York delivery at around \$12.50 c.i.f. and for Boston at \$12.75@\$13.50.

Export demand is quiet. Quotations for Pocahontas, New River and Kanawha gas coal showed declines from last week. No new business was reported in most quarters although Canada was reported as in the market for gas coals. A contract for 20,000 tons of Fairmont gas coal for French Railways was reported as having been closed with a New York house at \$6.50 c.i.f. Rouen, Nantes and LaPallice.

Interest in the soft-coal market in New York centered around screened and prepared bituminous coals as substitutes for anthracite last week. Inquiries were numerous and considerable business was placed.

Nearly all local houses reported inquiries for screened and prepared bituminous coal, as well as for coke. Quotations for high-volatile nut coal ranged \$2.50@\$3.25 f.o.b. mine; low-volatile screened coals \$2.75@\$3.25; Broad-top egg, stove and nut around \$5.30; low-volatile prepared coal, \$5.75@\$8 and high-volatile screened coal \$6@\$6.25.

All grades of coke were in strong demand and shippers reported many orders placed. Quotations ranged about as follows: Medium sulphur furnace, \$5.50 f.o.b. ovens; stove and egg, \$6.50@\$7; nut, \$5.50@\$6.50; run of oven, \$5@\$5.50, and pea coke \$4.50@\$5.

Dealers in Philadelphia are spreading around every car of anthracite received by cutting orders down. Their main object is to give all of their customers at least some coal to start with when the coal-burning season arrives.

The point has not yet been reached where the Philadelphia consumer is willing to take substitutes. This has always been a most difficult city in which to induce the consumer to take coke and bituminous in lieu of anthracite.

Steam sizes are still well sold, but all depends on the outcome on Sept. 1, for if work continues there will then be a surplus.

A slight increase in export coal movement has come at Baltimore following the slump of two weeks ago. The amount exported for the week ended Aug. 18 was approximately six times greater than that shipped from this port to foreign countries during the week previous. There also was one coke shipment cleared during the first-named period.

The coal trade in Birmingham is still suffering from a lack of satisfactory demand for commercial coal. Consumers are buying a few cars at a time where dependent on the spot supply and are not taking care of their needs beyond the immediate future. Trade in bunker or export is very quiet.

Foreign Market And Export News

British Coal Prices Hold at Steady Level, Though Welsh Outlook Is Unsettled

Though the outlook in Wales is unsettled, business is active enough to maintain prices at a steady level. The operators are cautious in view of the possibility of a strike in the United States anthracite field and also because of an intimation that Belgium is about to stop the export of coal. The Welsh pits have sold the bulk of their anticipated output for the next few months, and the operators, on the whole, are optimistic on the prospects for the rest of the year.

During the week ended Aug. 11 British collieries produced only 3,566,000 tons, according to the official reports, a decrease of 1,688,000 tons from the previous week's total of 5,254,000 tons. The falling off is accounted for by bank holiday week.

France and Italy are buying slowly, but business with Belgium, Spain and South America is good. The Great Northern Railway of Ireland is in the market for 50,000 tons of locomotive coal for delivery over the next six months, or alternatively 100,000 tons over the next twelve months.

The anthracite market is quiet, but heavy orders have still to be filled for Belgium and France. A steady business is being maintained with Canada.

The Newcastle market is quiet. The European situation is making itself felt and the Continent is buying slowly. Forward business is dull. Orders placed include Amsterdam gas works, 40,000 tons Durham gas coals for delivery August-November; Helsingfors gas works, 7,500 tons Wear special gas at 33s. c.i.f., delivery September-October; two orders for best steams at 31s. 9d. c.i.f.

French Imports of British Coal Fall Owing to Exchange Rate

During the last week arrivals of British coals in France showed a marked decrease, the reason being that actual quotations for such coals are absolutely prohibitive, owing to the rates

of exchange. There is a feeling that some other kind of fuel must be obtained to solve the problem, but this cannot easily be found.

On the whole the position of the French coal market remains unchanged. Offers of industrial coals practically meet the demand. The inquiry for house coals is quite dull for the time being and retailers are with difficulty replenishing their stocks for the coming winter.

Much interest is manifested in whether export permits for coal become operative in Belgium, as exportation is a vital point for Belgium, which is producing much more coal than she can ever have needs for. A meeting of the Charleroi collieries was to take place Aug. 27, with a small increase in prices likely to ensue. The men are coming back from the fields to the pits.

Reparation deliveries of fuel to France and Luxemburg improved during the latter part of July, the figures being coal, 182,300 tons; coke, 160,200 tons (17 per cent distributed to Luxemburg); lignite patent fuel, 6,300 tons, or a total of 349,700 tons, as against 465,300 tons for the month of June.

French supplies of coke for the first thirteen days of August have amounted to 51,000 tons or a daily average of about 3,920 tons. Should this continue, purchases of foreign cokes could then be avoided.

Coal Paragraphs from Foreign Lands

Assistant Trade Commissioner Charles B. Spofford, at Calcutta, reports the total output of coal in British India during 1922 to be 18,168,988 tons as compared with 18,358,934 tons in 1921.

A cable from Assistant Trade Commissioner W. E. Embry, at Santiago, to the Department of Commerce, at Washington, says that lower prices, together with lower freight rates, permit coal from the United States to compete successfully against Australian coal in Chile.

News Items From Field and Trade

ALABAMA

The Tennessee Coal, Iron & R.R. Co. plans erection of 350 bungalows at Fairfield.

The Alabama Iron & Coal Co., a Delaware corporation, dealers in coal, iron and other minerals and mineral rights, has established a branch office in Birmingham.

The I. O. Drewry Contracting Co. has purchased a large steam shovel for its stripping operations at Sunlight. This equipment weighs 340 tons and is capable of moving 500 cu. yd. of material per hour. The company also is constructing a 300-ton washery.

J. H. White, who has been district manager of the Senet-Solvay Co. for a number of years at Birmingham, has been promoted to the position of assistant manager of the coke department and will have headquarters in Syracuse, N. Y. Mr. White will be under A. F. Hilleke, formerly district manager at Birmingham but for several years general manager of the coke department of the corporation. It is announced that no one will be appointed to fill the position vacated by Mr. White, local superintendents at Ensley, Holt and Chattanooga reporting direct to the head officials at Syracuse.

C. P. Moore, who has been superintendent of the Empire Mines, formerly operated by the Empire Coal Co., but recently merged with the DeBardeleben Coal Corporation, has resigned his position at Empire and, effective Sept. 1, will become general manager of the Pratt Fuel Corporation, owned by the Walter Moore interests, formerly operating the Empire Mine.

COLORADO

The Canon District Coal Co. has been incorporated in Canon City, with a capital stock of \$50,000, by James L. Morgan and John Lippis.

ILLINOIS

The Paradise Coal & Coke Co. has resumed operations at Paradise after several weeks' shutdown for repairs.

Hanna City Mining Co., Peoria, has been incorporated with a capital of \$20,000. Incorporators, Cass F. Balm, L. E. Kauffman, J. F. Bartley.

Chicago Williamson Coal Co., Chicago, has been incorporated with a capital of \$10,000 to buy, sell and mine coal and other fuel. Incorporators, W. M. Stephenson, J. S. Bash, William J. Bash.

Mine No. 1 of the Wasson Coal Co., near Harrisburg, has resumed work after being idle since June 1. A new steel tippie was erected at the mine during the shutdown and is now practically completed ready for operations.

The Republic Coal & Coke Co. will handle the output of the recently organized Hanna City Mining Co., which has purchased the Hanna City mine of the Clark Coal & Coke Co. R. R. Ronk, of Peoria, is president of the Hanna City Co.; C. F. Salm, vice-president, and L. E. Kauffman, secretary and treasurer. Both Mr. Kauffman and Mr. Salm are connected with the Republic company.

Dr. F. C. Honnold, secretary of the Illinois Coal Operators' Association, is trying to obtain the endowment of a research scholarship in the college of engineering at the University of Illinois, to further advance the science of coal mining. In an announcement he states that the late Prof. H. H. Stoeck had urged such action and that Professor Stoeck's successor, Prof. A. J. Hoskins, is desirous of seeing it carried out. It is also brought forth in the circular that various industries, among them the electric, the steel, the telephone and the cement, are doing exactly the same thing with notable results. The scholarship would be in the form of a post-graduate scholarship and would cost \$600 a year. One-half of such a student's time would be devoted to research and the other half to his advanced studies. This is in line with the idea advanced by the Taylor Coal Co. of establishing endowments to put students through school with a view of developing technical mining engineers.

The Valier Coal Co., at Valier, has resumed work after a shut down of more than three weeks. Repairs and improvements were made about the plant during the intervening time.

INDIANA

Less than 73 per cent of the mines in the Terre Haute, Princeton and Sullivan coal fields are working as much as half time at present, according to a survey. The estimate was based on reports made on 123 mines in the field. A compilation of figures shows that during July American mine No. 1 of the Knox Consolidated Coal Co. hoisted the greatest tonnage—96,143 tons of coal. The mine was operated seventeen and one-half days. The best record for steady work was made by the Maumee Collieries mine No. 7, which operated 22½ of the 26 working days in the last month. The reports show that during July 1,219,628 tons of coal was mined at the three fields. Lack of orders was given as cause for the idleness of the mines.

Several thousand dollars damage was done at the Deep Vein mine between West Terre Haute and St. Mary of the Woods, Ind., recently when a fire, thought to have been caused by spontaneous combustion, burned away the entire tippie. Bruce Jeffers, top boss, was painfully injured in fighting the fire, by falling from the top of the tippie onto a pile of slack. A hose company was sent to the scene, but was handicapped by the lack of water at the mine. The supply in the cistern provided for fires was quickly exhausted and the city firemen were compelled to allow the fire to spread unhampered. The place has been idle for about a month.

A receiver for the Love Coal Co., Anderson, is asked in a complaint brought in the Superior Court by Charles L. Runyan Co., wholesale dealers in coal at Terre Haute. The Terre Haute firm alleges that the Love Coal Co. owes it \$10,000 and that a change in ownership was made without notice to creditors.

Star City Coal Mining Corporation, Indianapolis, has been incorporated with a capital of \$300,000; directors, Edward J. Boleman, Paul Kirk and Burrell Wright.

KENTUCKY

The Rowe Coal Co. has been incorporated in Madisonville by Lee S. Rowe, H. D. Rutledge and Daniel Kirkwood.

The Jerico Coal Co. has been incorporated in Whitesville with a capital of \$50,000, by W. Minter, Memphis, Tenn.; B. D. Williams, Jr., and Dolph Woodruff, of Mannington, Ky.

Western Kentucky coal companies in an effort to give the Northwest the sizes of prepared coal desired, are spending a lot of money on rescreening plants and boom loaders. The Black Diamond Coal Mining Co., Drakesboro, Ky., has installed a plant, and placed it in operation. The Rockport Coal Co., Rockport, Ky., Pacific Coal Co., Mercer, Ky., Holt Brothers Mining Co., McHenry and the Gibraltar Coal Co., Central City, also have installed such systems. The latter company installed two, one at its Brownie mines and the other at its Gibraltar mines.

An interesting case was settled last week when Chancellor Davis W. Edwards handed down an opinion in litigation between the Louisville & Nashville R.R. and Charles S. Nield, president of the Edgemont Coal Co., the railroad being awarded judgment of \$11,482.57, less a credit of \$457.33. The suit dates back to 1914, over the building of a spur track by the railroad to the Edgemont Coal Co., properties in Bell County, the question argued being whether the coal company had entered a contract whereby it would pay cost of construction of the track or a given part of it. A letter written by the late Milton H. Smith, president of the road, detailing the question of paying for the track, was construed by Judge Edwards as a contract, and he said that the letter had been accepted by the coal company, which would be bound by its provisions.

MICHIGAN

During July, 2,771,709 net tons of soft coal and 353,924 net tons of anthracite passed through the canals at Sault Ste. Marie. Of this tonnage 2,757,269 tons of soft coal and 349,424 tons of hard coal passed through the United States canal. The balance passed through the Canadian canal.

MISSOURI

The shaft for a new coal mine that is being sunk by Thomas Wood, west of Kirksville, is now down to 90 ft. The vein of coal is about 45 in. thick.

The Mendota Mining Co. has been incorporated in St. Joseph with a capital of \$200,000, to engage in the coal mining business, by B. C. Collins, J. J. Casey and J. H. Karnes.

A. E. Marriott and Evan Jones have obtained options on a tract of coal land near Higbee, and drilling machinery has been placed on the ground to test out the lease for the opening of a shaft. A switch will be built later to join that of the Walton Coal Co.

MONTANA

The Gilbert-Crawford Coal Co., of Round Up, is getting under way with a new property and expects to be shipping coal soon. This company was organized recently by Charles A. Crawford, formerly city passenger agent for the Northern Pacific at Helena, and Walter Gilbert of Minneapolis, Minn. Harry Bronstein, of Minneapolis, is one of the vice-presidents. Fred K. Huston, of Helena, is chief engineer and W. D. Hungate, of Helena, is secretary-treasurer.

NEBRASKA

What is said to be an extension of the coal fields of Kansas is believed to have been discovered near Auburn. A test well for oil was being sunk when the vein of coal was encountered. It is said to be large enough to warrant its mining on a paying basis.

NEW YORK

Sealed proposals will be opened, by the Superintendent of Lighthouses, Staten Island, N. Y., 2 p.m., Sept. 7, 1923, for approximately 1,800 tons bituminous steam coal during October, November and December, 1923, in quantities as required, trimmed in vessels' bunkers under contractor's coal chute, New York Harbor. Information on application.

D. R. Lewellyn, Merritt, Price, Ltd., miners and shippers of Cardiff coals, have removed their offices from 44 Whitehall street to the 11th floor of the Whitehall Building, 17 Battery Place, New York City. The office is in charge of W. H. Kelynack.

OHIO

After one week of existence under the title of the Swa-wood Coal Co., the name of this company has been changed to the Swain Coal Co., with practically the same personnel it started with. Its offices are in the Union Central Building, Cincinnati.

The Midvale Goshen Coal Co., of Cleveland, is erecting a complete steel four-track tippie at Wainwright. Roberts & Schaefer Co., of Chicago, are the contractors.

Hugh McVeagh, assistant general manager of the Big Four railroad and in charge of the fuel department of that road, resigned recently to become affiliated with a coal company operating through Cincinnati.

Geo. D. Cameron, Inc., Cleveland, has been chartered with an authorized capital of 2,000 shares, no par value designated to mine, buy, and sell coal and coke. Incorporators are George D. Cameron, Elizabeth Cameron, Winifred Cameron, W. H. Dickey and George B. Young.

The Kehota Coal Mining Co., which has headquarters in Pittsburgh and a large stripping operation at Redfield, near New Lexington, has suspended operations entirely owing to lack of orders.

The High Peak Coal Co., of Columbus, has been chartered with a capital of \$75,000 to mine and sell coal in various fields by Ralph G. Martin, R. McMurray, John W. Bricker, Ralph E. Marburger and E. H. Hauck.

The Blue Flame Coal Co., of New Lexington has been chartered with a capital of \$25,000 to operate in the Hocking Valley, by Sheldon Kinsel, R. W. Murray, Raymond Diller, T. M. Potter and Thomas Ward.

The Board of County Commissioners at Columbus has rejected all bids opened Aug. 8 for approximately 3,000 tons of mine-run coal for various county departments, as too high. It has been decided to purchase the supply on the open market for the present.

Asking appointment of a receiver for the Union Coal Stripping & Mining Co., of Cleveland, and also foreclosure of a \$204,580 mortgage on the property, B. D. Northrup, of Washington, Pa., recently entered suit in Belmont County Common Pleas Court against the company.

The Heinman Coal Co. has been chartered with a capital of \$50,000 to mine and sell coal in the Massillon field. The incorporators are August Heinman, Albert Heinman, Joseph A. Seifert, Albert H. Ess and Felix R. Shepley.

A. P. DeVennish, who has been in charge of the coal department of the Hocking Valley Products Co., for about a dozen years, has resigned to become sales manager of the Jay Miller Coal Co., Columbus. Mr. DeVennish has purchased an interest in the company.

W. J. Buchanan, superintendent of the Willis-Harlan Coal Co., was seriously injured while in the mines and was taken to the hospital in Pineville, according to advices that reached the Kentucky Fuel Co. in Cincinnati, which controls the Willis-Harlan Operations.

A general sales office of the Universal Coal Co. has been opened in Cincinnati, in charge of W. J. Richardson, vice-president, to take the place of those which were maintained at Price Hall, W. Va., where the seven operations of the company are located in the New River district. Eastern sales offices have been located at Richmond, Va., for some time and will not be disturbed.

Appointment of a receiver for the Union Coal Stripping & Mining Co., a \$4,500,000 Cleveland concern, and foreclosure of a \$204,580 mortgage on the company's property were asked in a suit filed in Belmont County Common Pleas Court, July 18. The suit was brought by B. D. Northrup, owner of a Washington (Pa.) foundry, holder of the mortgage.

The Groff-Sharshall Mining Co., chartered several weeks ago with an authorized capital of \$75,000, has taken over the properties of the Consolidated Mining Co., located near Shawnee. The properties consist of five openings and are being operated on a lease basis. Albert L. Groff has been named president and John S. Sharshall, secretary and treasurer. The Consolidated Mining Co., of which Henry Watkins is at the head, has moved into smaller quarters in Columbus, where a general jobbing business will be conducted. K. W. Rittenhouse, sales manager of the Consolidated Mining Co., has resigned, effective Sept. 1.

In an effort to stamp out the I.W.W. propaganda which has been freely circulated among miners in eastern Ohio of late, the district board of sub-district 5, United Mine Workers of Ohio, has suspended **Joseph Bryan** from the union for six months, sustaining Frank Ledvinka, president of the sub-district, who sanctioned not only Bryan's discharge from the plant at Stewartsville where he was working but also his suspension from the union when Bryan and other I.W.W. sympathizers fomented a strike at the plant of the Cleveland & Western Coal Co. and sought to prevent miners from returning to work after the strike was settled.

The American Export & Inland Coal Co. has announced that it intends to liquidate. In its place the Black Diamond Coal Mining Co. has been formed by the six operating companies in eastern Kentucky that have controlled the affairs of the company that passes out. The American Export & Inland Coal Co. was an Ohio corporation formed to take over the business of the American Export & Inland Coal Corporation in Huntington and Cincinnati. This organization figured prominently in the Ford coal deal when the Detroit manufacturer decided to close down his plant as a slap at the coal brokers. The operators found it necessary to take over the corporation in order to get their money. H. E. Mahan will be the president of the Black Diamond company and L. M. Birk its secretary and H. K. Howard general manager. Ernest Heasley and E. C. Randolph have stepped out.

The Dominion Coal Co. Columbus, has been chartered with a capital of \$25,000 to mine and sell coal and also to do a jobbing business in coke. The incorporators are K. W. Rittenhouse, L. C. Rittenhouse, D. F. Shafer, R. S. Oxley and Carl H. Valentine. The company will open offices at 16 East Broad St., in rooms formerly occupied by the Ohio & West Virginia Coal Co. A general jobbing business will be conducted and

a number of mine connections have been made. K. W. Rittenhouse was formerly sales manager of the Consolidated Mining Co., of Columbus.

OKLAHOMA

The Sullivan Machinery Co., Railway Exchange Building, St. Louis, announces that its Oklahoma branch office and warehouse have been moved from Henryetta to Muskogee in order to serve the coal industry to better advantage in that territory. The new office is at 428 North Second Street and Lysle D. Chase continues as local manager.

PENNSYLVANIA

C. F. Barrett, assistant sales manager of George E. Henry & Son, of East Brady, has resigned his position and intends to enter college.

Business in the Connellsville coke region seems to be picking up a little, and inquiries are more numerous, probably in anticipation of an anthracite strike. The Superior Coal Co., which had been idle for over a month, has resumed operations. The American Coke Corporation is firing 70 of the 142 ovens at the Linn plant, which has been practically idle for a few weeks.

Cosgrove & Co., large operators and shippers of fuel, with main offices in Johnstown, have purchased the **R. L. Sprout** mine operations and coal holdings near Windber. A new firm has been organized which will be known as the Windber Standard Coal Co., with H. J. Meehan as president and John C. Cosgrove, president of Cosgrove & Co., as secretary-treasurer of the new firm. A charter has been applied for. The new firm has taken charge. The coal is of the best quality in central Pennsylvania.

In filing appeals from tax assessments in Cambria County, the Blubaker Coal Co., owning 8,000 acres of fuel land in the county, and the Clearfield Bituminous corporation, which control 12,000 acres, set forth that the amount of taxes assessed against their lands exceeds the amount of the royalties collected annually on leases in which the owners assumed the burden of paying the taxes. The royalties were fixed years ago when the valuations were exceedingly low. Judge John E. Evans heard the arguments on the appeals and announced that decisions would be rendered later.

Coal production in the Somerset County field is now the heaviest in the history of the field, announces J. S. Brennan, secretary of the Somerset County Coal Operators' Association. Announcement is made that the Baltimore & Ohio R.R. has removed the percentage car supply in the Somerset field and expects to be able to furnish an ample supply of cars daily for the various mines. The removal of the percentage car supply became effective Aug. 9.

TENNESSEE

An involuntary petition in bankruptcy has been filed by three creditors of the Valley Coal Co. and the Valley Coal & Dock Co., Chattanooga.

UTAH

B. W. Dyer, of Billings, Mont., has arrived at the State Capitol to succeed **Chief Mine Inspector Allen**, who died a few months ago while on a special assignment for the U. S. Coal Commission.

VIRGINIA

Hoffman Bros., Punxsutawney, Pa., are drilling on the Crab Orchard property, Little Black Mountain, near Keokee, Lee County, for the **Blackwood Coal & Coke Co.,** who are planning extensive development work.

WEST VIRGINIA

The capital stock of the **Man Mining Company of Huntington** has been increased from 1,000 shares par value \$100, to 5,000 shares.

The Lambert Run Coal Co., of Fairmont, in which Clarence D. Robinson and others are interested, has been authorized by the Secretary of State of West Virginia to increase its capital stock from 250 shares of a par value of \$100 each to 5,000 shares of a par value of \$100 each.

In addition to the other indictments in connection with the trial of William Blizard, president of subdistrict 2, District 17, United Mine Workers, the grand jury on Aug. 10 returned two more indictments against **G. C. Mickey**, one of the defense witnesses in the first Blizard trial, concluded several weeks ago. He is charged with offering the Rev. J. E. Wilburn \$1,000

to leave the county and not testify for the prosecution and with having attempted to bribe jurors summoned for the second trial of Blizard. Although the grand jury was discharged after returning the indictments mentioned, it has been announced by Prosecuting Attorney S. M. Austin that a special grand jury will be called to inquire further into the bribery question.

The Prestonia Coal & Lumber Co. has just been organized with a view to developing the coal and timber resources of Braxton County, being capitalized at \$200,000. Sutton is to be the headquarters of the company. Identified with the new enterprise are C. Paul Heavener, Fred L. Fox, Thomas McCale, P. B. Adams and E. M. Smith all of Sutton.

With a view to operating in the Kanawha field, the Jennings Coal Co. has just been organized by northern West Virginia coal men, having a capital stock of \$25,000. The office of the company is to be at Monongah. Incorporators are: K. P. Beckner, J. W. Cross and Mary Beckner of Belington, S. J. Jennings of Monongah and J. S. Blackman of Shinnston.

Officials of District 17, United Mine Workers, announce that a **constitutional convention of the district organization** will be held soon as the outcome of an agitation started by R. M. Williams, James Hart and others in subdistricts 3 and 4 to obtain a stricter accounting of moneys paid into the district treasury. Williams and others working with him assert that fully \$70,000 is paid into the district treasury every month and yet that there is little pretense at accountability. Those behind the movement for a special convention also desire to have the miners' election of last December aired.

One thousand acres of coal land in the Fairmont region have been sold for approximately \$600,000 to Mortimer L. Hudson, of Chicago, secretary of the Hines interests. The purchase includes the plant and holdings of the Rivesville Coal Co. as well as certain tracts of Sewickley coal from the New England Fuel & Transportation Co., John F. Phillips, C. D. Robinson and Jacob F. Straight. The acreage is situated just west of the properties of the Fairmont & Cleveland Coal Co. Senator R. A. Pollock, who was president of the Rivesville Coal Co., will sever his connection with that company to re-engage in the operation of mines, having several propositions in view, although he has not yet consummated a deal. Jacob F. Straight, for some time secretary of the Rivesville Coal Co., will actively manage the Rivesville property for the new owner or owners.

The trial of Edgar Combs, charged with the murder of John Gore, during the armed march against Logan in 1921, will not be held until the October term of court, it was agreed early in August at a conference between John Chafin, prosecuting attorney of Logan County, and C. J. Van Fleet, who appeared for Combs and other defendants. The case had been called for trial on August 2. Combs was not admitted to bail. The most important witness against Combs is the Rev. J. E. Wilburn, who testified in the Lewisburg trial of Blizard that it was Combs who fired the shot which killed Gore. The case of the state against Harold W. Houston, general counsel for the miners' union in West Virginia, indicted on the charge of being an accessory to the murder of Gore and two other citizens of Logan County, also will go over to the October term through an understanding between Chafin and Van Fleet. When the cases against Combs, Houston and others do come up for trial a change of venue will be sought by attorneys for the union and union men involved in the armed march who have not already obtained such a change.

Having just obtained 150 acres of coal land at Beech Bottom in the Northern Panhandle of West Virginia **A. S. Burger and associates** are making preparations to begin development. The coal acquired is in the Pittsburgh seam and is said to be of unusual thickness. The acreage acquired is said to have cost approximately \$60,000. In opening a new mine, the new owners of the coal property will construct a tippie which may be utilized for loading coal either by rail or water.

S. A. Moore and associates, of Charleston, have launched the **Charleston Coal Corporation**, which is capitalized at \$50,000, with a view to engaging in the coal business in the Kanawha region. The office of the company is to be at Charleston. Associated with Mr. Moore as incorporators are A. J. Peck, J. F. Meadows, E. L. Ballard and W. Frederick, all of Charleston.

Purchase of 110 acres of Pittsburgh coal underlying the Lewis Cunningham estate on Dolls Run in Monongalia County, by W.

K. Hatfield, is regarded as the forerunner of extensive development in that section. The tract adjoins other tracts already held by Mr. Hatfield who it is said will soon sell the combined acreage to an independent coal company. That company is understood to be preparing to undertake the development of the acreage. The consideration involved for the 110 acres was \$50,000 or approximately \$455 an acre.

The Pond Creek Pocahontas Co. has closed a contract with Harry M. Waugh, a railroad contractor of Bluefield, to construct trackage leading to the company's operation and around the plant. The company is preparing to operate on an extensive scale at Bartley, in McDowell County, served by the Dry Fork branch of the Norfolk & Western railroad. A shaft is being sunk to the Pocahontas seam. Coal men chiefly identified with the Pond Creek Pocahontas Company are also the principal figures in the Island Creek Coal Co., operating in Logan County. Thomas E. Davis, of New York, is president of the Pond Creek Pocahontas Co. as well as of the Island Creek Coal Co.

Coal mines in the Winding Gulf, New River and Kanawha fields sustained heavy damages along with the Chesapeake & Ohio Ry. and the Chesapeake & Potomac Telephone Co. as the result of cloudbursts on the morning of Aug. 12, following freshets of the week previous. Numerous landslides were caused on the main and branch lines of the Chesapeake & Ohio in the very heart of the coal regions of southern West Virginia and particularly between Sewell and Quinnimont, there being several large slides near Piney Creek, Loop Creek and Laurel. On the main line coal freight traffic was held up for 36 hours.

Improvements now under way at the Thacker mines of the Thacker Coal & Coke Co. in the Williamson field will make the plant one of the most modern in the state. The cost will be not less than \$500,000. The company expects in September to show just what the improvements may mean in point of increased production. The Thacker company, of which Col. T. E. Houston is the directing head, is developing the territory on the west side of the creek preparatory to producing coal on both sides of the creek. The new tippie, of the endless chain, or conveyor type, is the last word in mining methods, making it possible to load five different grades of coal at one time. The tippie has a capacity of a railroad car per minute. The company also is building new stone headhouses, new stone retaining walls and is eliminating many curves in its trackage. It is proposed to install many new mining machines and to add many new steel mine cars to the equipment. In installing scales, the company will in the future pay its miners on a tonnage basis instead of a car basis.

The safety-first meet of the Bethlehem Mines Corporation, in which teams from eight different operations of that company participated on Aug. 17, is said to have been the most successful ever held in the Decker's Creek Valley. The contest was won by the team representing the Bretz mine. The Sabraton team took second place and the team from the Richard mine took third place. On the winning team were Edward S. Gurr, Charles B. Eye, N. B. Watson, E. J. House, H. Friend and William G. Johnson. The winning team was presented with a silver loving cup, purchased with the proceeds of a fund raised by the contributions from the superintendents of the various mines. The winning team will be sent to Buffalo on Sept. 22 to represent Preston County Division No. 3 in the general competition of the Bethlehem corporation when mine men will be pitted against mill men. Teams were entered from the following mines: Richard mine No. 21, O. T. Barnard, superintendent; Bretz mine No. 22, Weston Datson, superintendent; Kingwood mine No. 24, Harry Shaffer, superintendent; Sabraton mine No. 25, W. L. Coburn, superintendent; Masontown mine No. 26, C. C. Werner, superintendent; Burke mine No. 27, Ira Fluck, superintendent. A. W. Lauther is the general superintendent of the company in the district and was in charge of the meet held at Masontown. There was printed on the program for the day's events a list of "some of the things a first-aid man should know."

WISCONSIN

The Link-Belt Co., Chicago, Ill., has obtained the contract for furnishing the equipment for handling coal and ashes at the new Riverside pumping station, Milwaukee. The amount involved in the contract is \$40,000.

WASHINGTON, D. C.

The Finance Committee of the National Coal Association appointed to serve during

the company year includes: Ira Clemens, president, Clemens Coal Company, Pittsburgh, Kan.; L. C. Crewe, president, LaFollette Coal & Iron Co., LaFollette, Tenn.; E. L. Douglas, vice-president, First Creek Mining Co., Cincinnati; Harry L. Gandy, executive secretary, National Coal Association, Washington; M. L. Gould, president, Linton Coal Co., Indianapolis; S. Pemberton Hutchinson (chairman), president, Westmoreland Coal Co., Philadelphia; W. J. Sampson, president, Witch Hazel Coal Co., Youngstown, Ohio.

No definite steps will be taken by the District Commissioners to supervise the coal situation in Washington this winter until the national government has concluded its present efforts to avert a strike. In the meantime the city heads will keep in closest possible touch with every development so that they will be prepared to act intelligently and promptly should another fuel emergency arise this year.

CANADA

Howard Stutchbury, Alberta Trade Commissioner, has been addressing the boards of trade of a number of cities in Ontario where resolutions have been passed calling on the Government to assist in securing better freight rates from Alberta to Ontario than have yet been promised.

The Ferguson administration in Ontario will spend no more money on the Alfred peat manufacturing experimental plant. An Order-in-Council has been passed authorizing disposal of the premises and the newly developed cutting and drying machinery to a private individual who will operate it as a private enterprise.

According to Secretary Peacock of the Alberta mine workers, some five thousand of whom are out of work, a formal protest will be framed by the United Mine Workers against the importation of coal from the United States for use on certain sections of the Canadian National Railways.

Sir George B. Filmer and H. C. Zwarg, of the Anglo-Canadian Collieries & Refineries, Ltd., Edmonton, Alberta, are in Toronto in the interests of their company. The company, which recently obtained its charter, has acquired the rights of the Molecular Process, which was originated in Germany, and proposes to manufacture briquets from Alberta coal.

John McLeish, of Ottawa, Director of Mines for the Department of the Interior, said recently that over one thousand tons of Minto coal were used for domestic purposes in Ottawa last season. In addition to this amount which has been used for domestic purposes, the importation into Ottawa of 30,000 tons of Minto coal has been advertised there.

William Sloan, Minister of Mines, and George Wilkinson, chief inspector, inspected Nos. 4 and 5 Mines, Canadian Collieries (D), Ltd., Aug. 7 and 8. The Minister was impressed with the development work being carried on at No. 5 Mine, where two rock slopes have been driven to tap what is known as the Farm Seam.

Roy M. Wolvin, president of the British Empire Steel Corporation, which includes the Cape Breton coal mines, said recently at Montreal that irrespective of the quantity of bituminous coal coming in from the United States, there is ample soft coal in sight produced in Canada to meet all requirements for the future, whether American strike conditions make an abnormal demand or not. With regard to the British Empire Corporation, Mr. Wolvin said that during the strike it lost a great deal of production and had to replace a lot of this from the United States, which was a dead loss to Canada and Canadian labor. Due to the strike, their bituminous production in July had been 380,000 tons less than in June.

Fifty carloads of Alberta coal have been shipped to Ontario points over the Canadian National Ry. lines at the rate of \$7 per ton. This will enable a number of tests of the coal to be made to ascertain whether it will be acceptable to consumers. The officials of the Canadian Pacific Ry. have decided against the proposal to transport Alberta coal to Ontario at a \$7 rate, which is regarded as being below the actual cost of transportation.

One hundred thousand tons of Alberta coal placed on the Ontario market at prices which will compete with American anthracite is the proposition put forward by a deputation from the western province which called upon Premier Ferguson in Toronto. Attractive prices which will make this competition possible are to be secured by shipment by rail as far as Fort William and by the lake route thereafter to Ontario points.

Premier Ferguson, of the Province of Ontario, is reported to be working for a lower freight rate on coal shipped from the Province of Alberta to Ontario. He proposes presenting certain facts and figures to Sir Henry Thornton, president of the National Railways, which he hopes will result in the fixing of a lower rate than that of \$7 a ton, which has been extended to cover trial shipments aggregating 6,000 tons. Premier Ferguson is convinced that sufficient tonnage could be guaranteed to justify a rate that would permit Alberta's product to compete with Pennsylvania coal.

The newly introduced Self-Rescuer is being thoroughly tested in British Columbia and, if found to meet the claims of the manufacturers no doubt will be introduced on a considerable scale. Experiments are being carried out at Cumberland and at Nanaimo this month. The apparatus is said to give the wearer protection for seventy minutes against carbon monoxide gas.

Coal production of British Columbia during July exceeded that of June by about 26,649 tons. This is due chiefly to the Coal Creek Colliery of the Crow's Nest Pass Coal Co., whose output rose from 22,254 to 45,905 tons. The explanation is better demand and, as the market for this coal, particularly at this time of the year, is industry, in the forms of railways, smelters, etc., the improvement is both significant and gratifying. In the main the other active collieries of the province have about held their own. On Vancouver Island the Canadian Collieries (D), Ltd., mined 4,442 tons more in July than in June but the Western Fuel Corporation, Nanaimo, dropped some 846 tons. The Granby Collieries, Cassidy, also had a shorter output by some 912 tons while Messrs. King & Foster, operating the new mine in the vicinity of Nanaimo, show an advance of about 100 tons. In the Nicola-Princeton field the Coalmont Collieries produced in July 595 tons more than in the previous month while the Middlesboro Collieries and the Princeton Colliery dropped slightly. Aside from the Coal Creek Colliery the situation in the Crow's Nest field shows little change from that prevailing in June, the Michel Colliery and the Corbin Coal & Coke Co. being about in the same position in July as in the previous month as to production. Following are the details for July:

VANCOUVER ISLAND DISTRICT		Tons
Comox Colliery	25,111
Extension	20,027
South Wellington	7,393
Western Fuel Corporation of Canada		
No. 1 Mine	25,294
Reserve	18,471
Wakesiah	7,569
Granby M. S. & P. Co.	18,714
Nanoose Wellington Colliery	5,317
East Wellington Colliery	3,824
King & Foster	913
Total	132,633

NICOLA-PRINCETON DISTRICT		Tons
Middlesboro Collieries	5,737
Coalmont Collieries	10,204
Princeton Collieries	780
Total	16,721

CROW'S NEST PASS		Tons
Coal Creek Colliery	45,905
Michel Colliery	14,491
Corbin	3,059
Total	63,455
Total for province	212,809

Three thousand miners in District 18, United Mine Workers of America, including Alberta and part of British Columbia, are now out of work and in many places mines are running only on half time, according to the union officials. Much of the unemployment is in the mining fields that customarily supply the Canadian National Rys. with steam coal, while the slackening in the demand for domestic coal has resulted in the laying off of approximately 1,500 men in the Drumheller Valley.

A delegation of Alberta coal mine operators, headed by Sir George Filmer, waited on the Government of Ontario on Aug. 15 and announced that they were prepared to deliver 100,000 tons of coal during the coming autumn and winter at a price that would compete with United States coal, despite the unfavorable freight rates that the Canadian National Rys. have quoted. Sir George and his associates are interested in the Drumheller coal mines which at the present time are suffering from lack of business, in the neighborhood of half of the miners in the district being out of employment.

Obituary

James Burns, for fifteen years district field man of the Illinois Coal Association, died at his home in Springfield, Aug. 13. Mr. Burns' death was sudden and unexpected. He had been ill for a few days.

Louis H. Spier, traffic manager for the Stephens Fuel Co., New York City, died on Aug. 12. He had been connected with James Stephens & Son, later the Stephens Fuel Co., with the exception of a short period, since 1891.

Oscar F. Arnold, 79 years old, a veteran of the Confederacy and for many years in the coal business at Webb City, Mo., died recently at his home in that city. He was a native of Virginia and early in life moved to Bunceon, Mo. He served one term as a member of the lower house of the Missouri Legislature. The widow and one son, W. M. Arnold, of Kansas City, survive.

David Taylor, vice-president of the Coal and Iron National Bank, died in New York City Aug. 22, at the age of fifty years. Born in Jersey City, he was graduated with honors from the Pennington Seminary in 1888. Previous to his connection with the bank, of which he was vice-president, he had been with the Western National Bank and the Liberty National Bank. He was a director of Burns Brothers, the Madison Trust Co., the Wendell P. Colton Co., and the Harry J. Schnitzer State Bank. His home was in Madison N. J., where he was trustee of the First Presbyterian Church.

Thomas Fitzsimmons, 43 years old, one of the owners of the coal mines at Melbourne, Mo., died at the Wright Hospital in Trenton, Mo., where he had been taken to have an operation performed following an injury at the mine when a rock weighing 300 lb. fell from the roof of the mine and crushed him. His back was broken in three places and his entire body was paralyzed. In spite of his grave injuries he lived two weeks after the accident. He was a native of England and had lived for a time in Canada.

James M. Savage, general manager for Canadian Collieries, Ltd., died suddenly Aug. 12 at Wilson Creek, Washington, while on a motoring trip through that state. Mr. Savage was born at Three Rivers, Quebec, in 1865. He was identified with railroading and lumbering in Ontario and Manitoba until 1906, when he with associates organized the Pacific Coast Coal Mines, from which he retired five years later. He was appointed manager for Canadian Collieries in 1916, with head office at Victoria, and held that position until his death.

William Prince, one of the leading business men of the Winding Gulf region of West Virginia and closely identified with the coal industry of that section, died at Prince, W. Va., on Tuesday night, Aug. 14. Mr. Prince was largely interested in several mining companies and owned much stock in going coal concerns. He was 81 years of age and until within a few months prior to his death he had taken an active interest in the many enterprises in which he was interested.

Association Activities

The Illinois-Wisconsin Retail Coal Merchants' Association called an informal conference of the heads of the various mid-West coal merchants associations to a conference which was held recently in the offices of Secretary I. L. Runyan of the bi-state organization. Those in attendance, in addition to Mr. Runyan, were: C. A. Bruce, secretary of the Twin City Coal Exchange, Minneapolis; W. J. Womer, chairman of the transportation committee of the Chicago Coal Merchants' Association; F. E. Reeves, secretary of the Detroit Coal Exchange, and D. F. Roberts, traffic manager of the Indiana Coal Merchants' Service Bureau, at whose instance the conference was called. Various problems in regard to the handling of loss and damage claims and faulty weight problems were considered. It was declared to be the desire of those in attendance to evolve some standard basis for filing of claims, as it is thought uniformity in this matter will be advantageous. This was the first of a series of meetings which are planned to be held at intervals of about ninety days.

The regular meeting of the **Columbus Coal Bureau** was held Aug. 20 at the Chittenden Hotel, when F. W. Braggins, president of the Lorain Coal & Dock Co., was the principal speaker. Mr. Braggins, who was one of the prime movers in the formation of the bureau and also chairman of the publicity committee told of the purposes of the organization. He also talked on present conditions in the coal trade and predicted better times for the producer as well as others engaged in the industry. It is planned to have speakers in other lines of industry appear before the association at various intervals and tell of their experiences in other lines of business.

Traffic News

W. J. Smith has been appointed district manager of the Car Service Division of the American Railway Association with headquarters in Omaha, Neb., effective Aug. 15, 1923. Mr. Smith will have the authority of the Car Service Division in Nebraska, Wyoming, Colorado, Utah, Idaho, exclusive of Pan Handle, and Iowa terminals at Council Bluffs and Sioux City. The apportionments of territory assigned in circular of Jan. 11, 1923, which extended jurisdiction of the district manager at St. Louis over the State of Nebraska, of the district manager at Dallas over the State of Colorado, and of the district manager at Chicago over the terminals at Council Bluffs and Sioux City, Iowa, are thus amended accordingly, effective Aug. 15, 1923.

It has become definitely known in the past few days that the **Louisville & Nashville R.R.** has plans for two physical connections to its recently leased **Carolina, Clinchfield & Ohio R.R.**, provided the Interstate Commerce Commission approves of the lease, which is being fought by the Seaboard Air Line R.R. and the State of Georgia. The Louisville & Nashville proposed to connect its Eastern Kentucky division as well as Cumberland Valley division, one connection being made from the Lynch, Ky., district, and the other from McRoberts.

In the case of the **Indiana Power Co. vs. the Pittsburgh, Cincinnati, Chicago & St. Louis R.R.** and James C. Davis, Director General of Railroads, as agent—No. 13946—the Interstate Commerce Commission on July 20 ordered that defendant, James C. Davis, Director General of Railroads, as agent, pay unto complainant on or before Oct. 17, 1923, the sum of \$63.28, with interest thereon at the rate of 6 per cent per annum from Aug. 30, 1919, as reparation on account of an unreasonable rate exacted for the transportation of three carloads of run-of-mine bituminous coal from the steam tracks of the Pittsburgh, Cincinnati, Chicago & St. Louis R.R. at Edwardsport, Ind., to complainant's plant at that place.

The **Seaboard Air Line R.R.** system, backed by the Georgia Railroad Commission, will appear before the Interstate Commerce Commission on Sept. 24, at the hearing relative to the Atlantic Coast Line R.R., through its subsidiary the L. & N. Ry., having leased the Carolina, Clinchfield & Ohio R.R., under a 999 year lease, as an outlet from southeastern Kentucky to the A. C. L. connections to the Atlantic coast. The Seaboard will argue against the Interstate Commerce Commission's granting permission for the L. & N. to operate as proposed.

In the case of the **Webb Fuel Co. vs. the Director General of Railroads**, as agent—No. 13258—the Interstate Commerce Commission ordered July 20 that the defendant pay the complainant, on or before Oct. 17, 1923, \$45.09, with interest at the rate of 66 per cent from Jan. 1, 1919, as reparation on account of an overcharge on a carload of coal shipped from Ferndale, W. Va., to Madrys Spur, N. C.

A test is to be made of the federal statute enacted in 1920 providing that charges on C. O. D. freight must be collected before delivery. This case is the outgrowth of a suit by the Western Maryland Ry. against James E. Cross, a prominent coal operator of Mineral County, W. Va., for the recovery of freight charges on coal delivered before the freight bill was paid. The lower court found for the plaintiff on the strength of the federal statute mentioned. The case is to be appealed to the West Virginia Supreme Court.

Judge Thomas R. Gordon and Judge Henry S. Barker, in a written opinion, have decided in favor of seventy-five foreign railroads, defendants in a suit of the Commonwealth of Kentucky, seeking to collect taxes on rolling stock in the state and not listed for taxation. The opinion, a lengthy one, held that the state had no right to collect

the taxes, pointing out that witnesses on both sides had testified that no accounting is kept as to the number of cars in Kentucky at any given time. To keep the sort of check necessary if the cars were to be taxed, each railroad would have to maintain a bureau in the state, the court held, thus placing a burden on interstate commerce which would be prohibitive.

According to well authenticated reports, **Henry Ford** and **George L. Carter**, who had a prominent part in building the Virginian R.R., are about to combine forces in building a new railroad from Bluefield to Wilmington, N. C., and thus provide another route from the coal fields of Kentucky, West Virginia and southwest Virginia to the seaboard. It is understood that the automobile manufacturer has given his endorsement to the project, although plans for the construction of the road are said not to have gone beyond the embryonic stage. Soon after acquiring the Pond Creek coal properties, Mr. Ford indicated that he might extend the D. T. & I. Ry. to Pond Creek and since then there have been rumors that he might seek to build through the Logan field. If the D. T. & I. should be extended to Williamson there would still be another link between Williamson and Bluefield to be built, before constructing a line through to Wilmington, N. C. Mr. Carter, formerly identified with several railroad projects in Tennessee, is making his headquarters at Millsville, Va., where he is an operator of coal mines.

The Interstate Commerce Commission on Aug. 15 ordered a hearing on the lawfulness of the rates, charges, regulations and practices of the schedules contained in the new tariff of the **Mobile & Ohio R.R.** known as Supplement No. 3 to I. C. C. No. B-540, applying to bituminous coal from mines in Illinois to certain stations in Missouri, to have become effective Aug. 16. The hearing is to be held Sept. 18 at 10 a.m. at the Hotel Jefferson, St. Louis, Mo., before Examiner Flynn. The commission also ordered that the operation of the said schedules contained in said tariff be suspended, and that the use of the rates, charges, regulations and practices therein stated be deferred upon interstate traffic until Dec. 14, 1923, unless otherwise ordered by the commission, and no change shall be made in such rates, charges, regulations and practices during the said period of suspension unless authorized by special permission of the commission.

The Interstate Commerce Commission has issued an order, effective Sept. 5, supporting the contention that the **Chestnut ridge**, not **Laurel ridge**, should be the dividing line for rate making purposes, between the Meyersdale and the Connellsville districts. The effort to relieve the Indian Creek Valley from the differential imposed by making the rate from points on the Indian Creek Valley railroad the Meyersdale rate plus 10 cents, began about eight years ago, when the commission was petitioned to extend the western boundary of the Meyersdale rate district to a line marking the crest of Chestnut ridge. The action was opposed by the Baltimore & Ohio Ry. on the ground that Laurel, not Chestnut, ridge was the natural boundary between the Somerset and Fayette county thin vein coal deposits.

Coming Meetings

New York State Coal Merchants' Association will hold its annual convention on Sept. 10-12 at Sacandaga Park, N. Y. Executive secretary, G. W. F. Woodside, 250 Arkay Building, Albany, N. Y.

Oklahoma Coal Operators' Association will hold its annual meeting Sept. 13 at McAlester, Okla. Secretary, A. C. Casey, McAlester, Okla.

The **American Mining Congress** will hold its twenty-sixth annual convention in conjunction with the **National Exposition of Mines and Mining Equipment**, Sept. 24-29, at the Milwaukee Auditorium, Milwaukee. Secretary, J. F. Callbreath, Washington.

National Safety Council will hold its twelfth annual safety convention at the **Buffalo Statler Hotel**, Buffalo, N. Y., Oct. 1-5. Secretary, W. H. Cameron, 168 No. Michigan Ave., Chicago, Ill.

The **West Virginia-Kentucky Association of Mine, Mechanical and Electrical Engineers** will hold its annual meeting Oct. 19-20 at Huntington, W. Va. Secretary-treasurer, Herbert Smith, Robson-Prichard Bldg., Huntington, W. Va.

Coal Mining Institute of America will hold its annual meeting Dec. 19, 20 and 21 at Pittsburgh, Pa. Secretary, H. D. Mason, Jr., Chamber of Commerce Building, Pittsburgh, Pa.

COAL AGE

The Only National Paper Devoted to Coal Mining and Coal Marketing

C. E. LESHER, *Editor*

Volume 24

NEW YORK, SEPTEMBER 6, 1923

Number 10

Small but Irritating

IN DIGGING up and publishing the records on 750 cars of anthracite shipped into New England last winter the Coal Commission airs some coal-trade scandal. It is a scandal, of course, that a car of coal should be subject to not one but several rake-offs totaling from \$4 to \$5 per ton. Such extravagant profits as these, of course, are unusual and could be possible only under such conditions as last winter. When the demand for coal can be met only by exercise of such trade practice it is well to inquire into causes.

The first cause was the strike of the miners, which cut off some 40,000,000 tons of needed production. The other causes are small by comparison. There is nothing and no way to prevent the repetition of such pyramiding of middlemen's profits, or for that matter of extraordinary operators' profits on the part of those who will take them, if there is another winter of strike and short hard-coal supply.

Startling as the figures are the total tonnage on which such margins are extorted or even possible of extortion is small. When New England takes several thousand cars of anthracite each week throughout the year, 750 cars on a part of which there was gouging, is small but irritating—even exciting—news.

Punishment—Not Dissolution

OUR contemporary the *Iron Age* last week urged that the government take steps to dissolve the United Mine Workers as "an organization that is inimical to public welfare and illegal in its practices." We cannot hold with the *Iron Age* that the union should be abolished, nor do we believe that is really what is meant in this instance.

In the first place it is useless to talk of doing away with the miners' union. It is too strong and too dear to the hearts of many workers. Furthermore, unionism is an important and necessary factor in the coal industry. It has brought the mine worker to an advanced position, has stabilized his wages and prevented in large areas a form of cut-throat competition of bygone times that made operators sell their men rather than their coal. It has even stabilized conditions in the non-union fields—put those districts on good behavior. The working conditions and wages of non-union coal miners in recent years have been above the average for the organized workers. No, the coal industry does not want the union dissolved—not even the non-union operators wish it—nor would it be in the public interest. The conduct of the United Mine Workers since the war has been such as to call for punishment rather than dissolution.

The policy and methods of the union are and have been militant, arrogant and unreasoning in the extreme.

John L. Lewis, as head of the organization, takes the firm position that he is hired by some 600,000 fighting industrial workers to exact from society every concession, advantage and dollar that the "full economic strength" of such a body can be made to yield. It is admitted that he does a good job. Also he believes in his cause.

The country is impotent before such a policy and type of leadership. It is impotent because our political leaders fear its power and are timorous about telling the public the whole truth. Some hold to the charitable belief that by soft dealing the good that is in the union can be made to assert itself. The only way to bring the Lewis policy to an end is to defeat its workings. That means, in plain language, for the country to get behind a strike and see it through. No wonder Lewis opposes arbitration—he can get the same or better terms by direct action that at once entrenches his position and solidifies the union. The present strike will end when the public says "enough."

Roosevelt and Pinchot

GOVERNOR PINCHOT has not followed the plan of action of his former chief, President Roosevelt, who in 1902 had a similar situation on his hands. After the anthracite mine workers had been on strike for some five months in the summer of 1902, the President forced the reluctant operators to agree to arbitration. He did not attempt to tell either party what it should do or to dictate the terms of settlement for that momentous strike. In one important respect conditions were similar to those of today. The operators, prior to the closing of the mines, were insistent that the public would not meet the advance in price necessary to cover a wage increase and that competition with bituminous coal had already set an upper limit to what could be charged for hard coal.

Governor Pinchot, on the contrary, has set himself up as the arbitrator and seemingly has taken the position that the public interest is so great that both the operators and the mine workers must accept at once his snap judgment of the terms of settlement and not stop the production of coal. It is true that he lacked not in sources of information. He was not obliged to start investigation, for the resources of the Coal Commission were put at his disposal. So, with some two days and the assistance of experts of all shades of opinion—volunteers and otherwise—at his command, the Governor worked out and announced his formula for a settlement.

It is not pertinent or necessary to comment on Mr. Pinchot's idea of what constitutes even-handed justice for all three parties at interest, save to note that his very evident anxiety to be the one to prevent a strike must have prompted his proposal to grant a 10 per cent

increase in wages. A makeshift compromise always involves concessions. That was one for the miners. For the operators he said that the question of the open or closed shop is not involved, and thus laid aside the demand for the check-off. And for the public, which already finds the price of hard coal too high, he proposes the fantastic theory that the added cost of production, which he recognizes must be absorbed somewhere along the line by someone, will come out of freights and distributors, because he thinks it should.

Governor Pinchot deserves credit for his attempt to break the second deadlock in negotiations, but his valor is more praiseworthy than his discretion. The strike is on; production has stopped. Negotiations between the operators and miners, with Mr. Pinchot as a go-between, are still on. As an unsought arbitrator he failed; it remains to be seen whether as a mediator he will fare better.

Defeatism

DERAILMENTS in our coal mines have often been considered as acts of God—as something that cannot be avoided and for which no one is responsible. They are surely more amenable to treatment than this attitude would indicate. If railroads had dismissed the matter as cavalierly as do our managers, engineers and mine foremen, people would be afraid to travel on the railroad. As a plain matter of fact we have only just begun to study mine track. Our speeds are slow but our curves are sharp and one operating condition compensates for the other.

Mr. Martin in this issue gives the mining engineer much to think about when he shows that curves and switches cause loss of power where the speed must be lessened by braking for their safe "negotiation," when he indicates that they may give a resistance equal to a 2-per cent grade even when properly laid and elevated and when he tells us that the rails should be spread almost $1\frac{1}{2}$ in. for a radius of 50 ft. where the wheelbase is 42-in.

But what is the real wheelbase? Surely on a curve it is the projected distance in the line of the track between the point where one of the front wheels of a truck rubs the ball of one rail and the point where one of the rear wheels rubs the opposing rail. It would be well if this clearance wheelbase were given for every locomotive so that the correct spread of the rails for every curve might be determined. Certainly the clearance wheelbase is much greater than the wheelbase as we understand it. Assuming that the flange is not coned and the ball of the rail is not rounded at the edge and that the contact between the two is at the top of the rail—three things which are not true—the clearance wheelbase would be longer than the true wheelbase by over 11 in. Supposing we have a 1-in. flange and the wheel is 30 in. in diameter and, further, let us assume that the tread has been worn all over 1 in., then the flange depth will be 2 in. and the increase in wheelbase from the point of view of ability to turn on a curve will be $15\frac{1}{2}$ -in. This added to a 42-in. wheelbase is quite important. As stated, there is a degree of uncertainty about such a figure the determination of which would be well worth while. Why should not the manufacturer give it for a standard shape of mine rail the weight of which is recommended for his locomotive?

Until we know more about sharp curvature, and at coal mines our curves are sharp at best, we must not

permit ourselves to indulge in defeatism and declare that derailments are inevitable. Some companies rarely have a derailed locomotive, and if they have succeeded why cannot others? We can avoid derailments by using easier curves and save money thereby doubtless, but that is an unscientific way of approaching the problem. Economically speaking, curves should be made as sharp as they can be operated with safety and economy. Easy curves weaken pillars and roadways, often involve heavy timbering and always expensive trackwork.

For this reason we should know just how sharp curves can be made and still be "negotiable" at speed, and if the answer is that they cannot be made safe then let us know the sharpest curve that is safe and how it can be laid to avoid accident and also just what curve will be most profitable for a certain daily tonnage with given conditions of roof, always bearing in mind the diameter of the wheel and the size of the flange.

With the limitations of the coal mines in view the whole problem of tracks and trucks arises anew. A few years hence doubtless we shall find it has been so carefully studied that it has assumed a new and more definite aspect.

Substitutes

GOVERNORS and Governors' representatives from eleven anthracite-consuming states gathered in New York last week at the invitation of the Federal Fuel Distributor to talk over ways and means of keeping the people warm in the event of a sustained hard-coal strike. The significant thing about the meeting was that there was but one concrete proposal made. So far as the Governors were concerned, they just "marched up the hill and then marched down again." Most of them had experience last winter and previously in handling coal shortages and they know that it is no sinecure. But when it came to talking over the prospects in the recent situation they were headed nowhere.

The one concrete proposal was made by the soft-coal operators. It was simply stated. If there is no hard coal, then the people must use something else and that something else must be largely bituminous coal. Nothing can fill the gap so quickly. And the soft-coal men said they were prepared to see that their product was properly distributed and to co-operate with the various state authorities in taking care of emergencies. They offered to have the government set what it considered a fair price. And then the soft-coal men left the meeting. The Governors took the very sensible view that there is nothing to do now and that their job is to accept the good intentions of the bituminous-coal operators at their face value and to do whatever the Federal Fuel Distributor might from time to time suggest in the way of getting coal to their people.

There will be no rush for substitutes; that will be one of the difficulties. So long as there is hope that the strike is to be of short duration retail dealers are and will be reluctant to buy something that they may not be able to sell. Householders will buy substitutes only when they are close to actual need. Really all there is to do now is to continue the education of the householder and many of the retailers in the possibilities of substitutes, show them whenever and wherever possible how such fuel can be used and let the normal channels of distribution take care of getting it to them as the need arises.

Southern Field Has Most Beds and Deepest Workings In Entire Pennsylvania Anthracite Region*

Fifty Years' Operation Sees Output per Man Increase 8.1 per Cent,
While Every Other Field Except Panther Creek Loses — Irregular
Seams Present Many Problems and Delay Complete Electrification

BY DEVER C. ASHMEAD
Kingston, Pa.

A NUMBER of superlatives are necessary in discussing fifty years of operation in the Southern field of the Pennsylvania anthracite region. The field is underlaid with twenty-two beds, the largest number in any section of the whole region. The maximum depth is the greatest there. Geologic upheavals left the beds in the most disturbed positions, some of the coal having been pulverized to a point of worthlessness in the process. The production per man in this field shows the greatest increase since 1872 of that in any field, though this increase is only 8.1 per cent and leaves the average daily output per man at a bare 1.67 tons. Electric haulage motors appeared earliest there, though electrical development thereafter lagged behind the other fields. In most respects, however, the field has followed the general course of the whole anthracite region toward ever-increasing difficulty and cost of operation.

The Southern field outlined for the purposes of this article is practically identical with the territory commonly called by that name. However, a few collieries at the east end of it were added to the Panther Creek field discussed previously, and are excluded here. Data for the Southern field are sparse because the companies did not furnish to the State Department of Mines information on depth of workings and thickness of beds. Practically no data on the number of employees, tonnage and haulage were reported by inspectors during the years 1872 to 1877—the first period in the fifty years covered in this study—but a considerable amount is available after 1877.

TABLE LX. NUMBER OF COLLIERIES IN THE SOUTHERN FIELD

Years	Total as Reported by Department of Mines	Having Thickness and Depth Data	Having Tonnage Data
1872.....	64	0	0
1877.....	39	0	3
1882.....	54	0	38
1887.....	31	0	19
1892.....	32	0	22
1897.....	37	0	30
1902.....	33	0	28
1907.....	35	0	30
1912.....	35	0	30
1917.....	39	0	31
1922.....	41	0	35

Although the maximum number of collieries shown as operating in any one year is only sixty-four, there have been, according to the state reports, a total of 134 opened during the fifty years since 1872. Only nine of these have operated the whole eleven periods covered by this study. Three collieries operated through ten periods, four through nine periods, three through eight periods, six through seven periods, six

*This is the seventh in a series of articles by Mr. Ashmead describing conditions in the fields of the Pennsylvania anthracite region. Previous articles appeared in *Coal Age* on Feb. 22, March 22, April 5, May 10, May 31 and June 21. The final article, which summarizes the study for the anthracite region as a whole, will appear later.

through six periods, eleven through four periods, ten through three periods, twenty-two through two periods and fifty-two operated in only one period. This short-time operation of the collieries has affected the production of coal as will be brought out later in this article.

Twenty-two beds appear in this district—probably more than in any other of the anthracite regions. They are especially numerous in what is now known as the 18th Anthracite Inspection District. In the whole Southern coal field the following beds are found, named in order from the surface down. Lewis, Palmer, Little Tracy, Big Tracy, Diamond, Little Orchard, Orchard, Primrose, Holmes, Mammoth, Skidmore, 7 ft., Buck Mountain, Scotts Steel, Lykens Valley No. 0, No. 1, No. 1½, No. 2, No. 3, No. 4, No. 5, and No. 6. Of course all of these beds are not workable over the whole area of the Southern coal field. The coal lies as is shown in Fig. 75 in a great trough. This makes the beds steeply inclined. Bed

FIG. 74 — NUMBER OF COLLIERIES IN SOUTHERN FIELD

This diagram shows the number of collieries on which depth and thickness and tonnage data were available. It also shows the number of collieries in the field.

depths are greater here than in any other region in Pennsylvania. At one operation a shaft 2,500 ft. deep is contemplated. In parts of the region the upheaval has been so great that the coal has been rubbed between the top and bottom rock and has been almost pulverized, so that at the present time this coal has little value and cannot be mined.

The power-consumption curve in Fig. 76 and the figures in Table LXI show the same general decrease in tons of coal produced per boiler and engine horsepower installed that has been noted in articles describing the other districts.

Generally speaking, the collieries in this region have been more backward in adopting the use of electricity than elsewhere. Centralization of mine power plants such as may develop in this district will have a tendency to reduce the amount of power required to produce the coal or it will permit the greater use of electricity and electrical machinery, which may increase the power consumption per ton, but will tend to decrease the man-power and therefore increase the production per employee.

In 1921 the State Department of Mines reported that the boiler-horsepower installed amounted to 71,360 as against 72,620 in 1917. At the same time the number

TABLE LXI. POWER USED IN PRODUCTION OF ANTHRACITE IN THE SOUTHERN FIELD

Years	Boiler Horse-power Installed	Engine Horse-power Installed	Tons Produced per Boiler Horse-power	Tons Produced per Engine Horse-power	Tons of Coal Hauled per Mule per Day	Underground Locomotives per 100,000 Tons Produced per Year
1887.....	16,080	0.68	13.7	0.003
1892.....	23,790	0.53	11.7	0.003
1897.....	44,512	0.53	18.2	0.003
1902.....	48,134	50,135	0.50	0.48	18.6	0.05
1907.....	65,973	88,164	0.37	0.31	16.8	0.40
1912.....	68,965	105,703	0.44	0.29	19.6	0.62
1917.....	72,620	116,555	0.44	0.27	23.0	1.05
1921.....	71,360	0.42	21.8	1.28

of collieries reported in the region increased from 39 in 1917 to 41 in 1921. So instead of expecting a decrease in the boiler-horsepower installed, one would expect an increase. Part of this decrease may be explained by the fact that some of the independent collieries have abandoned their boiler plants and have purchased power from central power stations. At one of these there had been a plant with a boiler installation of about 2,000 hp.

It was in this region that electric motive power was first introduced in the haulage of coal. Nevertheless, the number of underground locomotives is smaller in this region than in many of the other regions. The Lackawanna County district has 3.12 motors per 100,000 tons of coal produced annually in 1921; the Wilkes-Barre district, 2.64; Nanticoke, 2.36; Eastern Middle field, 1.06; Panther Creek, 2.03; Western Middle field, 1.17; and the Southern field has but 1.28.

Of course the geological conditions in many of the mines do not permit the use of a large number of locomotives, for the beds are steeply pitching and the locomotives can be used only for main haulage. Fig. 77 shows that the number of locomotives has had practically an even, steady increase since 1902.

Unfortunately, data on the number of mules in service do not extend to the period before 1887, so it is impossible to estimate the amount of coal hauled per underground locomotive. The curve is of value only as it shows the influence of the motor on the amount of coal hauled per mule.

Although the number of collieries in the Southern field increased from 39 in 1917 to 41 in 1921, there was a decrease in the number of mules in service from 1,385 in 1917 to 1,376 in 1921. Although this decrease amounts to only 9 mules, there were 3 more collieries and these collieries were mostly small ones where locomotives were few, so the decrease is significant.

Output per man in the Southern field increased 8.1 per cent since 1872. This is the greatest increase in the whole anthracite region. Only one other district—Panther Creek—showed any increase whatever. The others decreased. Taking the Southern field curves shown in Fig. 78 and for the moment considering only the bottom set of curves, which show the production per employee, it is seen that the solid line which represents the original data shows an increase in the amount of coal produced per man. When these original data are corrected for sizes not shipped in the earlier years, and further corrected to reduce all data to an 8-hour day basis from the 10-hour day in effect before 1902 and the 9-hour day before 1916 the dot-and-dash curve results. This shows the same general increase in production although in a somewhat less degree. If the year 1897 is disregarded, as in the previous article, because of unsatisfactory state reports that year, and the average for 1892 and 1902 is taken in its place, then for the period from 1887 to 1921 there is a steadily increased production per man, if the hectic war year 1917 is properly discounted.

In the Lackawanna County district the decrease in the production per man amounted to 31.2 per cent; Wilkes-Barre, 30.2 per cent; Nanticoke, 21.1 per cent; Eastern Middle field, 30.6 per cent; Western Middle field, 9.1 per cent; in the Panther Creek district production increased 1.6 per cent, while in the Southern field the increase was 8.1 per cent.

TABLE LXII. MULES AND LOCOMOTIVES IN SOUTHERN FIELD

Years	Mules in Service	Inside Locomotives	Years	Mules in Service	Inside Locomotives
1887.....	795	1	1907.....	1,494	33
1892.....	1,138	1	1912.....	1,543	57
1897.....	1,501	2	1917.....	1,385	100
1902.....	1,286	7	1921.....	1,376	115

The average tonnage per man in 1921 in these fields was as follows: Lackawanna County, 1.74; Wilkes-Barre, 1.48; Nanticoke, 2.02; Eastern Middle, 1.95; Panther Creek, 1.89; Western Middle, 1.80; Southern,

FIG. 76—DAILY PRODUCTION OF COAL PER BOILER AND ENGINE HORSEPOWER INSTALLED

The method of calculating these curves will be found in the Feb. 22 issue of *Coal Age* under Fig. 8 on page 326.

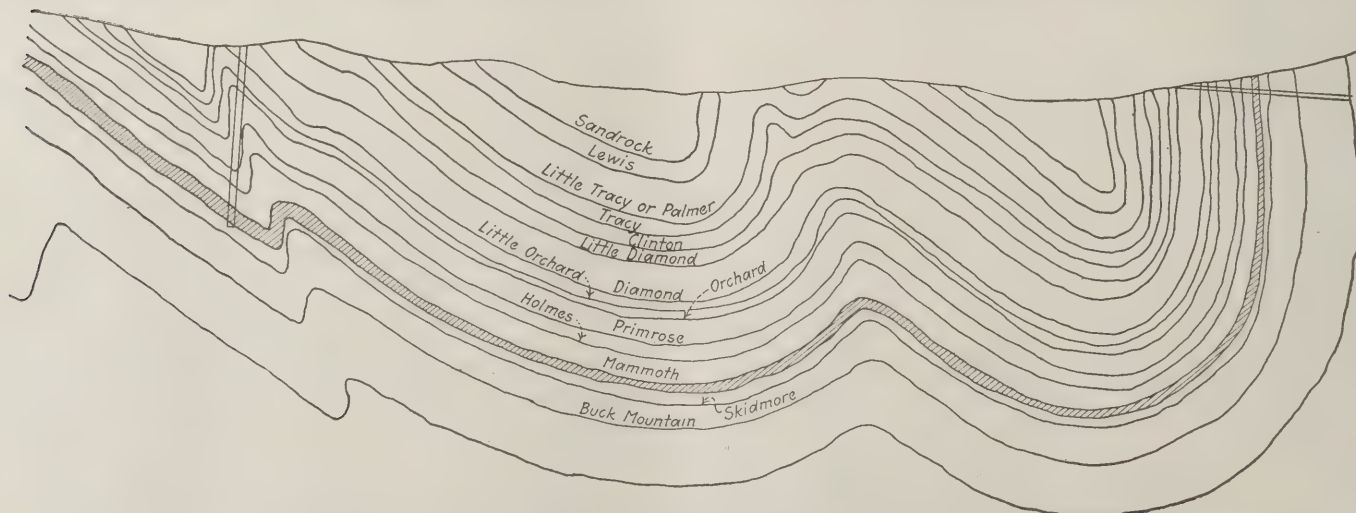

FIG. 75—A GENERAL CROSS-SECTION OF THE SOUTHERN COAL FIELD

1.67 tons. Thus only Wilkes-Barre showed a lower tonnage per employee than the Southern field. In spite of the general increase in output per employee the average production per inside employee dropped 5.8 per cent. The middle set of curves in Fig. 78 illustrates this trifling decrease. The lines undulate uniformly through

FIG. 77—AVERAGE DAILY TONNAGE HAULED PER MULE AND NUMBER OF UNDERGROUND LOCOMOTIVES PER 100,000 TONS

On page 327 of *Coal Age* in the Feb. 22 issue under Fig. 9 will be found the description of the method used in the calculation of this curve.

TABLE LXIII. PRODUCTION AND DAYS WORKED IN SOUTHERN FIELD

Years	Production in Gross Tons	Average Number of Days Worked	Years	Production in Gross Tons	Average Number of Days Worked
1882.....	2,152,503	220	1907.....	5,938,368	264
1887.....	1,860,336	231	1912.....	6,318,398	235
1892.....	2,977,004	216	1917.....	7,422,697	287
1897.....	3,759,676	170	1921.....	7,042,500	275
1902.....	2,894,120	131			

TABLE LXIV. AVERAGE DAILY PRODUCTION PER EMPLOYEE

Years	Per Total Employee			Per Inside Employee			Per Outside Employee		
	Re-ported	Cor-rected for Small Sizes	Cor-rected for Time	Re-ported	Cor-rected for Small Sizes	Cor-rected for Time	Re-ported	Cor-rected for Small Sizes	Cor-rected for Time
1882.....	1.25	1.76	1.54	2.01	2.83	2.57	3.45	4.86	3.89
1887.....	0.98	1.32	1.15	1.52	2.04	1.86	2.78	3.73	2.98
1892.....	1.24	1.54	1.34	1.90	2.36	2.15	3.59	4.48	3.58
1897.....	1.74	2.07	1.81	2.79	3.32	3.07	4.62	5.50	4.40
1902.....	1.69	1.80	1.59	2.71	2.89	2.63	4.45	4.76	4.23
1907.....	1.46	1.53	1.42	2.24	2.34	2.09	4.25	4.44	3.95
1912.....	1.66	1.72	1.60	2.37	2.45	2.31	5.56	5.74	5.10
1917.....	1.90	1.90	1.90	2.58	2.58	2.58	6.16	6.16	6.16
1921.....	1.67	1.67	1.67	2.42	2.42	2.42	5.80	5.80	5.80

the 50 years, descending in the first period, then rising between 1887 and 1902 (considering 1897 statistics in error), sinking again to 1907 and finally climbing in the final period to a point just 58. per cent short of the start. The three peak points on the curve—1882, 1902 and 1917—are all within 0.05 tons of each other. During the early years of the half century under discussion a number of collieries were in operation for only a short period. Most of their mining was done above water level. This can plainly be

FIG. 78—AVERAGE DAILY PRODUCTION PER EMPLOYEE

A full description of the methods used in the calculation of these curves will be found in the footnote to Fig. 10 in the Feb. 22 issue of *Coal Age*, page 327.

shown by the report of the Second Geological Survey of Pennsylvania, which shows the workings of the mines in 1888. A mine with only a short life is apt to use many men in development work, which naturally tends to reduce the production per man. So in this case the shape of the curve is largely influenced by the fact that many mines in the region were short lived. Thus the production per man in the earlier periods was reduced but the curve actually shows an increase. For example, in 1882 there were reported 13 new operations and it is probable that a considerable amount of development work was carried on. In this same year 16 mines shut down. These mines probably had a greater production per man as the development work in them had probably ceased. In 1887 there were five new mines and 11 quit. In 1892 six opened and nine closed; in 1897 eight opened and seven closed; in 1902 only three opened and seven closed. In 1907 seven opened and three closed; in 1912 only one opened and none closed; in 1917 three opened and two closed. It can readily be seen what influence this continual change in the mines being opened and abandoned in a region would have. From the foregoing it is seen that the greatest change was in the earlier years and that from year to year changes were fewer. This falling off shows the changed policy of the operators, who are now operating their collieries more systematically than in the past.

FIG. 79—AVERAGE DAILY PRODUCTION FOR INSIDE EMPLOYEES

A detailed description of the methods used in the calculation of these curves will be found in the description of Fig. 11 in *Coal Age* for Feb. 22 on page 328.

The upper set of curves in Fig. 78 shows how the improvement in the preparation of coal has affected the production of coal per day per outside employee. There has been a steady increase in the production of this field from 1887 to date. From 1882 to 1921 the increase was 49.1 per cent.

By districts this increase from 1887 was: Lackawanna County, 34.4 per cent; Wilkes-Barre, 2.9 per cent; Nanticoke, 43.1 per cent; Eastern Middle, a decrease of 11.4 per cent; Panther Creek, an increase of 80.6 per cent; and Western Middle, 41.5 per cent. If, however, the lowest point in the production is compared with 1921 the following proportions of increase

TABLE LXV. AVERAGE DAILY PRODUCTION OF INSIDE MEN

Years	Miners and Miners' Laborers		Inside Company Men		
	Reported	Corrected for Small Sizes	Reported	Corrected for Small Sizes	Corrected for Time
1882.....	3.90	5.49	5.72	7.59	8.04
1887.....	2.48	3.34	3.95	5.31	4.25
1892.....	3.08	3.85	4.95	6.17	4.94
1897.....	4.19	4.99	8.39	10.00	8.00
1902.....	4.58	4.89	6.67	7.13	6.34
1907.....	4.08	4.26	4.98	5.20	4.63
1912.....	4.46	4.61	5.07	5.25	4.67
1917.....	4.72	4.72	6.56	6.56	6.56
1921.....	4.77	4.77	4.89	4.89	4.89

are shown; Lackawanna County, 46.8 per cent; Wilkes-Barre, 47.5 per cent; Nanticoke, 75.2 per cent; Eastern Middle, 47.7 per cent; Panther Creek, 80.6 per cent; Western Middle, 69.1 per cent, and the Southern field, 72.5 per cent. This shows the real improvement in each of the districts due mainly to improved methods of preparation.

In the lower set of curves in Fig. 79, which shows the tons of coal produced per day per miner and miners' laborer, one sees by the dash line, which is the corrected line for small sizes, that in the period 1882 to 1887 there was a sharp decrease in the output. From 1887 to 1902, cancelling the doubtful year 1897, there was an increase. Then the curve turns downward during the next five-year period and the last fourteen years show an increase.

The general increase in production during the fifteen-year period from 1887 to 1902 probably was caused by the general abandonment of the policy of working a colliery only a short time. The decrease in 1902 to 1907 will be discussed later in the article of this series when similar decreases which occurred in other districts are discussed.

The increase during the last 14 years of the curve, probably was caused by a further change in mining policy. During this period there seems to have been a concentration of work. Second mining was conducted more systematically and thoroughly. The amount of development work was not as intensive as it had been in the previous periods. This permitted of greater production. This greater production was influenced by the release of mine cars from the development work, permitting them to be used for coal loading, thus giving the miners better turn.

An example of this is enlightening. At a certain colliery in the Eastern Middle field there is a stripping plant and a slope under operation. Due to an accident, the stripping had to be shut down for a few days and the mine cars, which had been loaded by the steam shovel, went into the slope. With these extra cars the miners were able to load 40 per cent more coal from the slope than they had been able to do in the past. This 40-per cent increase in production counterbalanced the loss of the stripping coal. No more men were employed in the slope than were normally used.

TABLE LXVI. MEN EMPLOYED IN THE SOUTHERN FIELD

Years	Total Employees	Inside Employees	Outside Employees	Miners and Miners' Laborers	Inside Company Men
1882.....	7,708	4,878	2,830		
1887.....	8,055	5,202	2,854	3,195	2,007
1892.....	9,724	6,367	3,357	3,927	2,440

FIG. 80—PERCENTAGES OF EMPLOYEES BY CLASSES

These data were obtained from the reports of the mine inspectors of the Department of Mines of Pennsylvania.

It is possible that the introduction of underground haulage has had a considerable influence on the production of coal. Mechanical haulage naturally handles the mine cars with greater rapidity and therefore less

TABLE LXVII. PERCENTAGE OF GIVEN CLASSES OF EMPLOYEES TO TOTAL EMPLOYED IN THE SOUTHERN FIELD

Years	Inside Employees	Outside Employees	Miners and Miners' Laborers	Inside Company Men	Miners and Miners' Laborers (A)	Inside Company Men (A)
1882.....	63.3	36.7	41.9	21.4	59.4	40.6
1887.....	64.6	35.4	39.6	25.0	61.4	38.6
1892.....	65.6	34.4	40.4	21.2	61.7	38.3
1897.....	62.1	37.9	41.4	20.7	66.7	33.3
1902.....	62.1	37.9	36.9	25.2	59.4	40.6
1907.....	65.1	34.9	35.8	20.3	55.0	45.0
1912.....	70.1	29.9	37.3	32.8	53.1	46.9
1917.....	69.0	31.0	40.2	28.8	58.2	41.8
1921.....	66.7	33.3	33.8	32.9	50.5	49.5

(A) To inside employees.

time is consumed from the time of loading to the time of dumping and the return to the loading place. It may be interesting to note that one of the largest of the companies in the anthracite region, having operations in many of the coal fields described in this series of articles, reports that its mine cars make a general average of 1.2 trips per day.

The upper set of curves in Fig. 79 shows the daily production of coal per inside company employee. Here again the 1897 data are manifestly incorrect and the average of 1892 and 1902 should be considered instead. From 1902 there has been a general decrease in the daily output per man. This is partly because of the introduction of electricity into the mines. The development of haulage has tended to decrease the number of men required for this purpose.

There has been a gradual decrease in the number of miners and miners' laborers in this region during the past 40 years. The decrease in the number of outside employees has not been as great as one would be led to believe when one views the curve showing the increased production per outside employee.

IN STUDIES OF LOW-TEMPERATURE CARBONIZATION of coal made by the Bureau of Mines, various sections of coal from the Pittsburgh seam and roof were distilled. The Pittsburgh seam gives as an average 33 gallons of tar per ton. The "rooster" coal above the roof averages 28 gallons per ton; and the roof itself 23 gallons per ton. All tars have the same characteristics.

Curve Resistance Greatly Impedes Mine Haulage; Much Track Spread Needed on Sharp Turns*

Need for Investigation Into Loss of Power in Mine Haulage—Curves
May Increase Tractive Effort as Much as a Two-per Cent Gradient
—Correct Switch Design Will Make Deceleration Unnecessary

BY J. D. MARTIN

Chief Engineer, Hillman Coal & Coke Co., Pittsburgh, Pa.

NOTHING perhaps that adds to the cost of coal production is more neglected than the design of mine tracks. You can inspect a plant and find up-to-the-minute hoisting equipment, tippie, power plant, machinery and locomotives and may find them properly installed and functioning economically, but when you reach the track, switches and auxiliary apparatus you are likely to find that little progress has been made. The fault does not lie with the manufacturer of track equipment but with the engineers at the mine.

We find at the mines no end of delays due to derailment of locomotive trips, yet it is well realized that derailments always result in time lost, which means less tonnage and consequently lower profits. Perhaps less engineering skill is applied to mine tracks than to any other feature in the installation of mines so far as individual plants are concerned. It is a feature which has been allowed to drift along by itself and to make whatever progress it could. The engineer, superintendent or manager who is precise in his specifications covering a contract for a structure, hoist, or locomotive may order trackwork with only a passing thought as to its application; thus what development and progress has been made has been achieved without any help from the mining industry as a whole.

On the other hand, railroad trackwork design has been placed on a high plane and valuable data and theory have been tabulated for practical use. The investigations of the various engineering societies and the products developed by the manufacturers and tested out in practice have led to a basis of standardization for standard-gage railroad work, and part of the results have found their way into the equipment for use on light track. The classes of equipment are radically different, however, and the same general designs and the same formulas do not generally apply.

As has been stated already, there is much research work to be done, experiments to be performed and formulas to be evolved before we are ready to standardize light-rail track. This is work for engineers scientifically trained; the work must be done in a scientific manner if the results are to be as they should.

The study must include not only the frogs, switch points, switch throws and the necessary fittings, together with the proper design and application of each, but the widening of the gage on curves, curve resistance and curve compensation, as well as track and train resistance, allowable widening of gage for different weights of rail, the size of wheels and tires for various classes of rolling equipment and track, the gage of trucks with relation to the gage of tracks and the increment or decrement in the track gage for different

wheelbases, as well as other factors, less important but nevertheless requiring consideration.

In order that the tractive effort of the locomotive shall be kept at a minimum all the factors tending to increase it must be kept at a minimum. Consider:

(1) The grade resistance. This, of course, is determined to a great extent by the local mine conditions, which may not permit the necessary grading to reduce the track grade to that desired. We can, however, in any given case determine just what per cent this grade will be.

(2) The equivalent grade due to journal friction, train resistance and curve resistance. Journal friction clearly depends upon the type of trucks and bearings used, whether plain or roller-bearing. Train resistance depends upon the condition of the track. Curve resistance depends upon: (a) The amount of slipping and sliding of the wheels due to the difference in length between the outer and inner rails on the curve, which difference in length must be taken up in the slipping and sliding of wheels and cannot be compensated by coning the tires, as is sometimes assumed. (b) Flange resistance due to the bearing of the flange against the outer rail wherever the super-elevation of the outer rail does not reduce this resistance to zero. (c) Resistance due to the vertical height to which one or two wheels are lifted vertically throughout the length of the curve wherever the gage of the track is not sufficiently widened.

(3) Resistance due to change in velocity. As the

The combined resistance of the curve due to sliding of wheels and flange resistance may be summarized in the formula deduced by Raymond: The total curve resistance in pounds per ton total load.

$$R_c = 0.4 + D \left(\frac{500 f (G + b + \sqrt{G^2 + b^2})}{5,730} + 0.04 \right)$$

Where D = degree of curve
G = track of gage
b = wheelbase
f = coefficient of friction

RESISTANCES FOR CERTAIN CURVES AND WHEELBASES

Wheelbase, Ft. In.	Resistance in Pounds per Ton	Total Resistance in Pounds per Ton			
		50 Ft.	100 Ft.	150 Ft.	200 Ft.

FIG. 1—RELATION OF RESISTANCE TO CURVE RADIUS

A truck with a 24-in. wheelbase traveling around a curve of 50-ft. radius on a level is subject to a resistance equal to that acting against the same truck on a straight track and having a grade of 1.82 per cent against the load. The coefficient of friction against sliding is assumed as 0.2.

*Abstract of article entitled "Standardization of Mine Tracks," read before Engineers' Society of Western Pennsylvania.

FIG. 2—GRAPH SHOWING GAGE INCREASE ON CURVES

This also shows the maximum spread allowable for wheels with 3-in. tires running over rail of various weights per yard and designed according to American Society of Civil Engineers standards. The curves show that trackwork cannot be designed independently of rolling equipment.

train is accelerated from rest to a certain velocity there is a certain quantity of kinetic energy stored in the train due to the velocity of translation of the train itself and to the velocity of rotation of the wheels. When the train is stopped this kinetic energy is not reclaimed but is lost in heat due to friction as the brakes are applied. Thus it becomes evident that the greater the number of times the train is stopped or retarded in its travel from the face of the shaft bottom or other terminal the greater will be the power loss due to this one cause.

After we have adopted the minimum grade which mining conditions will permit we may have, say, a maximum or ruling grade of 1.5 per cent so far as the track grade is concerned. If the journal, train, and curve resistances are reduced to their equivalent grade, however, we will find that instead of operating a train over a ruling grade of 1.5 per cent we virtually will be operating over as high as 2 or 3 per cent. This can be seen from Fig. 1, where curve resistance alone may be equivalent to as much as a 2-per cent grade.

FIG. 3—GAGE INCREASE REQUIRED WITH CURVES OF CERTAIN RADIUS

The tabulation does not consider the diameter of the wheels in the widening required on curves. This factor cannot be eliminated and the above tabulation therefore is subject to correction.

These conditions and relations are illustrated graphically in Fig. 2.

The power lost due to overcoming the resistance of acceleration may be diminished considerably if locomotive roads, curves and switches are so designed that the train may be accelerated from rest to the desired velocity and maintained at the same velocity from terminal to terminal. If, however, it is necessary to reduce the speed of the train to a low value for each curve

FIG. 4—SWITCH LENGTHS REQUIRED FOR CURVES

The point of the switch is taken as $\frac{1}{4}$ in. and the heel distance as 4 in. With a 36-in. wheelbase and radius of 200 ft. the angle subtended by the base of the truck is 51 min. and 34 sec., which corresponds to a switch point between 19 and 20 ft. long and therefore is recorded in the third table as 20 ft.

encountered or for each switch traversed, the power lost from this cause will be proportional to the number of accelerations.

It is clear that these factors all have an important bearing on the total drawbar pull of the locomotive and consequently on the total power required to move the train from one terminal to another; and it is evident that, if all things are duly considered, the drawbar pull can be greatly decreased by a proper design of trackwork.

In Fig. 1 it is seen that the equivalent grade due to curve resistance is a big item. In order to reduce this to a minimum the gage of the track on the curves must be properly widened. At this point, however, both the width of tires and the weight of rails must be taken into consideration. If we are to reduce the resistance to a minimum the gage must be properly widened (see Fig. 3).

It has been said already that to keep the resistance due to velocity at the minimum and the haulage power bills also, the train must be kept at the same velocity, or as nearly so as possible, from terminal to terminal. To accomplish this the switches over which the train operates, as well as the curves, must be so designed that the train may safely pass over them at its rated velocity.

In order that this may be done the frog, the switch radius and the switch points must have certain definite relations. An illustration of this is shown in Fig. 4. For example, the angle subtended at the center of the curve by the wheelbase of the truck should remain constant from the point of curvature to the point of tangency. In order that the truck shall be drawn around the curve with a uniform drawbar pull the angle which the switch rail makes with the straight rail must be maintained equal to the angle subtended at the center of the curve by the truck, thus maintain-

ing a uniform drawbar pull from the moment the truck is fully on the switch point until it has rounded the curve and is again on straight track. By designing switches with this point in view it is possible that the rolling stock will receive but one shock, due to impact, when the truck hits the switch rail, whereas if this angle is not kept constant, each change in it means an additional shock or impact.

EVERY TRACK DETAIL MUST MATCH EQUIPMENT

All the relations as above set forth may not be theoretically correct in the last analysis, but they are sufficiently accurate to indicate that if the best results are to be obtained relations between the switch radius, length of switch points, frogs, weight of rail, wheelbase and width of tires cannot be chosen arbitrarily but must be determined by the use of a series of data and tabulations which will guide the designer accurately in the proper choice of the various factors entering into the design.

The foregoing theory and method of carrying out these designs is meant only as an illustration of what is required. This is a long, complicated and very much involved subject, however, which requires not only theoretical formulas and data but also requires many empirical data which can be obtained only by making proper dynamometer and other tests on moving trains.

Provision for Keeping Shaft Sump Clean Of Fallen Coal at Minimum Cost

BY GEORGE BOWKER

West Frankfort, Ill.

AT ALL coal mines using self-dumping cages part of the coal falls down the shaft, some being caught at the ground landing and the rest going back down into the sump. The quantity thus falling varies from a few tons to several carloads per day, depending upon the tonnage and speed of hoisting. At a mine with which I am acquainted the quantity of coal falling back into the sump was so great that hoisting frequently had to be suspended until the cage seats could be cleaned in order to allow the cages to land.

This was not the only trouble, for after the day's hoisting was completed a night shift of six to eight men would have to be employed to clean out the sump so as to be ready for the next day. It can be readily seen that this was very expensive. To avoid this expense the management devised a method that entirely eliminated the delay during the hoisting period and cut down the number of men required to clean the sump from eight to two. This saves the wages of six men at \$7.25 per day, which would aggregate a large sum of money at the end of a year.

DESCRIPTION OF PLAN ADOPTED

The method employed at this mine is as follows: A roadway was driven in the shaft pillar at right angles to the empty run-around. A slope into the bottom was started out of this roadway at right angles to the empty-car track and dipping as it progressed toward the shaft at a slope of 1 in 4. This was driven till the foot of the incline was in line with the end wall of the shaft. The slope was not driven directly under the shaft but a short distance to one side of it. A large sump was then dug about 12x18 ft. and 20 ft. deep.

When the sump was finished it was lined with concrete, 30-lb. rails being placed across it upon which a floor was laid. Connection was then made between the original and the new sump and an iron chute built in the concrete wall that entirely separates the two sumps. A pumproom is built alongside the new sump. Here a 6x6½-in. triplex pump handles the water. All the coal falling back during the day is stored in the original sump and chute.

When the sump is to be cleaned a car is placed under the chute and the iron door that closes it is raised by pulling on a lever, allowing the coal to slide out into the car. At the head of the incline an electric hoist is installed to haul the cars up the incline. All the water made in the shaft is collected in a water ring and piped into the new sump, making the shaft bottom completely

SLOPE TO SUMP GIVES ACCESS TO FALLEN COAL

Much coal falls from self-acting shaft dump. Some falls on the tracks of the landing but more into the sump, where it can be reached only with difficulty. An incline has been driven low enough at one end for the coal to be passed through a chute into a car stationed at the track terminal.

TWO SUMPS ARE PROVIDED AT THIS MINE

One, the upper sump, is for coal, and the other, the lower, for water. The sump is, therefore, easily cleaned, and the water never fails to have adequate storage. This arrangement reduced the cleaning force to one-fourth of that formerly employed. The pumps at all times draw their water from a relatively clean sump.

dry. Though this may seem expensive, yet when we consider the quantity of coal falling back in a day's time from an output that runs around 5,000 tons and when we keep in mind the number of men required to clean the sump it will be seen that the improvement will soon pay for itself. By using the electric hoist the coal can be hauled up the incline during working hours and spotted in a convenient place so that the locomotive can take it to the bottom, from which it can be hoisted during the day.

Seam of Coal in Canada 200 Ft. Thick Yet Operation Was for a Time Abandoned

"AT COAL MOUNTAIN, where the Corbin Coal & Coke Co. is mining," said Robert Strachan, in a paper entitled "Coal Mining in British Columbia," presented to the Canadian Institute of Mining and Metallurgy and reported in the *Monthly Bulletin* of the society, "the seams are standing almost perpendicular and attain great thickness, which latter appears to be due to monoclinical folding of the measures. In a horizontal section of 2,604 ft. there is 814 ft. of coal. The whole mountain has not as yet been thoroughly inspected, and although over a million tons of coal have been extracted this tonnage does not represent more than a scratch on the surface of the mountain.

"The seams have been correlated only with difficulty. They are from 150 to 250 ft. in thickness and contain a thick band of shale running irregularly throughout. Great deposits or 'pockets' of coal have been discovered and conservative estimates of the reserves of coal are from 1,500,000 to over 4,000,000 tons. So far, only one of these pockets of coal, locally called the 'Big Showing,' has been attacked. The mine by which it is developed, known as No. 3, is situated about one mile south of and about 6,200 ft. above the town of Corbin. At this point a cut reveals a synclinal basin about 370 ft. in width at the center of which the coal is 200 ft. thick. This deposit is in a direct line with the mines at Corbin and although the geological relations have not as yet

been fully established, drillholes and open cuts have indicated that this 'pocket' is a continuation of the Corbin coal measures.

"The method of mining these large bodies of coal consists of first stripping the surface *débris* and coal blossom and then loading the coal directly by steam shovels into railroad cars. This system did not prove as economical as might have been expected, and much coal was lost in stripping. Little opportunity was afforded for picking out foreign matter or for selecting any portion of the coal being mined, and this mine or quarry later was temporarily abandoned. The operations might have been conducted on a less spectacular scale with more benches and employing either chutes or retarding conveyors to take the coal down the hill in small cars. Had this been done the expensive railway constructed might have been dispensed with. It also would have made it possible to eliminate the extremely fine coal found near the crop as well as the foreign matter, thus providing a more suitable coal for the market.

"In addition to No. 3 mine or the 'Big Showing,' three other mines, Nos. 4, 5 and 6, have been opened convenient to the railway at Corbin. All of these are underground workings. No. 4 mine is worked on a vertical seam of coal approximately 150 ft. thick. No. 5 mine is worked under similar conditions. The No. 6 seam, the most recently opened, was found to be 400 ft. thick at an elevation of 5,315 ft. A level driven on this seam 75 ft. higher proved the thickness of coal to be 375 ft., and another level yet 66 ft. higher proved 150 ft. of coal across the seam.

USE MODIFICATION OF ROOM AND PILLAR METHOD

"The methods followed in working the coal have been modifications of room and pillar adapted to vertical seams. The pillars were subdivided into portions so small that they were crushed. Thus the space formerly occupied by the pillars was filled by a lowering of the roof. The coal was drawn from the chutes until this rock or waste showed up, then the chute was closed and similar operations commenced on another series of pillars outbye.

"With the opening of the large seam at No. 6 mine a new method of working is to be followed. The seam will be blocked out in sections and mined by slicing. Planks or lagging will be laid down as a floor for the first slice, using this floor as a roof for the next slice and allowing the roof to cave. These floors will prevent foreign material from mixing with the slice, or lift, of coal being taken.

The coals mined at Corbin have been found to be much higher in fixed carbon and lower in volatile than the general run of coals in the district. They are more like the seams at Morrissey than like those at either Coal Creek or Michel. The following analysis is typical:

	Per Cent		Per Cent
Moisture.....	0.75	Fixed carbon.....	69.00
Volatile matter.....	22.75	Ash.....	7.50

The various seams which have been mined at Corbin at one time or another are:

Seam No.	Thickness in Feet	Seam No.	Thickness in Feet
1	170	4	200
2	12	5	12
3	200	6	400

The coal is dark, glossy and friable. The weakness of the coal is illustrated by the fact that the pillars will run of their own weight or when assisted by roof pressure.

Why Series Haulage Motors Flash And How to Cure That Fault

Conditions in Design, Commutators, Brushholders, Carbons, Windings and Operation May So Affect Commutation as to Cause It

FLASHING of haulage motors, also commonly known as bucking or blowing, is primarily caused by poor commutation, which results in a sudden breakdown of the insulation over the face of the commutator from the brushholder to the motor frame or ground. As a result there is a sudden rush of heavy current which will either open the circuit breaker, or hang on as an arc, and badly burn the parts short-circuited.

The results of flashing are varied. Sometimes the motor is so badly damaged that it is inoperative. In this case the motor must be overhauled, armature windings repaired, commutator cleaned up, brushholders and wiring-around-frame put in good condition. When the short-circuit is immediately cleared the motor generally can be continued in service to finish its run, but should be reported as defective and given a careful inspection for any damaged parts that need attention.

In Table I is given a detailed layout of the various conditions that affect commutation of a haulage motor which, in turn, influences its flashing.

TABLE I—CONDITIONS THAT TEND TO PRODUCE FLASHING

Design.—Questions of design are best handled by co-operating with reputable manufacturers. Nothing pleases a manufacturer more than to have the operator of electrical equipment take up questions of design with the designers. The manufacturer who can say that the user has given him many points of advantage which have been incorporated into his machine has a real argument for serving the industry.

(1) The design cannot be changed without practically rebuilding the motor or

(2) By replacing with a modern motor in which the objectionable features have been eliminated.

Commutators.—Care of the commutator is highly important. The commutator is what makes the direct-current machine. Commutator troubles soon develop into serious breakdowns, consequences which affect the operation of the whole machine. Important points are:

(1) The commutators should be tight and have a smooth, highly polished clean face.

(2) If loose, the commutator should be heated and the ringnut or clamping bolts drawn up tight.

(3) All high or low bars and flat spots should be ground smooth if possible; otherwise the armature should be put in a lathe and turned.

(4) The mica should be undercut to a depth of $\frac{3}{8}$ -in., and all particles of mica thoroughly cleaned out of the slot.

(5) If the sharp edges left on the copper segments when undercutting are rounded off, this will improve conditions.

(6) The corners at the outer edge of the commutator face should be rounded off with approximately $\frac{1}{8}$ -in. radius, and those at the inner edge of the commutator face with approximately $\frac{1}{16}$ -in. radius.

(7) The commutator face should be kept free from oil and dust.

Brushholders.—The brushholders may cause the best grade of brush to work poorly. Vibration, chattering, etc., frequently are caused by improper adjustment of the brushholders. The salient points on brushholders are:

(1) On the average, the tension on carbon brushes should be kept at approximately 5 to 7 lb. per square inch.

(2) Broken pressure springs should be replaced by new ones.

(3) When the spring pressure is weak, wind up the tension spring.

(4) If the mechanism tends to stick, a little signal oil on moving parts may relieve this; if not, take the brushholder apart, clean and machine parts that are tight.

(5) When parts are badly worn, allowing the contact tip to rest on top of the carbon box, replace the worn parts by new pieces.

(6) Brushholders should be set approximately $\frac{1}{8}$ -in. from the face of the commutator, and the sides of the box should line up parallel with the commutator segments.

(7) The distance between brushholders measured around the surface of the commutator should be one-fourth of the number of bars.

(8) With but few exceptions, the brushholder carbon box should line up with the center line of the pole.

(9) A carbon box which is worn wider than normal will allow the brush to swing off the neutral. In double-end operation due to uneven wear in running in different directions, the contact area also is considerably reduced. New brushholders will remedy trouble from this cause.

(10) Brushholders should have at least $\frac{1}{8}$ -in. to $\frac{1}{4}$ -in. clearance to ground. When clearance is less than $\frac{1}{8}$ -in., insulating arc shields, properly located, can be used to advantage.

(11) Lining the inside of the motor frames around the brushholders, and at the commutator front V-ring, with insulating material tends to reduce flashing at these points.

Carbon Brushes.—Low-grade carbons are expensive

at any price. Cases have been known where a good brush would last years while a poor brush would cause more damage to the commutator in a day than the proper brush would cause in two or three years. Due consideration must be given to the following points:

(1) Poor commutation can sometimes be greatly improved by changing to a higher grade of carbon brush.

(2) If the carbons are too long, the resultant pressure from the brushholder contact tip is not on the top of the carbons, and the effective force on top of the carbons is reduced. For the more recently designed brushholders, carbons when new, should be 2 in. long.

(3) When the carbons are too short, the pressure on top of carbon is reduced, due to the design of the spring, and sometimes when the carbon is very short it is entirely out of range of the spring, which strikes the side of the box. These carbons should be replaced by new ones.

(4) Loose carbons cause vibration and tend toward poor commutation. Use new carbons with 0.006 to 0.008 in. initial clearance.

(5) Tight carbons stick in the boxes and the contact at the surface of the commutator is broken. This condition can be remedied by rubbing the sides of the carbons on sandpaper.

(6) Broken carbons should be replaced.

Windings.—The windings should be kept clean of all kinds of dust, dirt and oil. This does not mean the mere cleaning of the other surfaces of the winding. The gradual accumulation of carbon dust in a winding is sure to cause trouble. Machines which have broken down because of insulation failure show a surprising accumulation of dust and dirt in the windings, this being the more surprising when the machine is known to have been operated under the best of conditions. The ventilating air currents passing through the winding are laden with small particles of carbon and copper dust.

Summarizing the important points on proper care of the winding they are:

(1) Wiring around frame leads to brushholders, if broken or loose, so as to swing against the frame, should be repaired and securely fastened.

(2) In connecting the leads to the commutator it sometimes happens that the throw of the lead is either too great or too short, which has the same effect as shifting the brushholders.

(3) Short-circuited main field coils produce a weak field and result in poor commutation; this condition further has a damping effect on the field that opposes sudden field changes with same results.

(4) A reversed main field coil produces a weak field and consequent poor commutation. Check the polarity and reconnect.

(5) Field control motors with coils that have a number of turns arranged to be cut out have been known to be so connected that the weak field is used in place of the strong one. Check connections.

(6) Where the field coil is encased in a metal box to make it water and fireproof, this box acts as a damper and opposes sudden field changes. Sometimes this is remedied by making a saw-cut in the box and filling the opening with a hard insulating material.

(7) A short-circuited commutating pole-coil produces a weaker commutating field, which results in poorer commutation.

(8) A reversed commutating pole-coil weakens the commutating field and results in poorer commutation. Check the polarity of the coils.

Operation.—Ignorance of the proper care and operation of electrical machinery sometimes is dangerous and always is uneconomical from a maintenance and power point of view. Several suggestions for bettering conditions may be grouped as follows:

(1) Faulty control operation that allows sudden voltage changes at motor terminals can be remedied by checking the control circuit.

(2) Rapid acceleration can be remedied by issuing instructions to the motor-men or by the use of an automotioneer or automatic control.

(3) Suddenly reversing the current through the motors to make a quick stop, commonly known as plugging the motors, tends to cause flashing. A campaign of education of the motormen is the best remedy.

(4) Heavy service with a number of cars pulling on the line at the same time, sometimes causes sudden voltage changes, resulting in flashing. This condition might be helped somewhat by a rearrangement of the schedule.

(5) Troubles caused by breaks in the trolley at cross-overs can best be reduced by passing over this special construction work with power off.

(6) Where high-speed running (ordinarily down-grade) causes flashing, the motorman should keep within a definite maximum speed.

(7) If high trolley voltage—600 to 650—is used on motors designed for 500 volts, motor details must be kept in good condition.

(8) When the motors are overworked and considerable heat and gas (from insulating compounds of newly repaired windings) are present inside the motors, these tend to prolong a flashover, and can be relieved by operating the motors with the commutator covers off.

(9) Loose or worn bearings allow considerable vibration, which tends to lift the carbons from the commutator, and cause flashing.

(10) Rough track has an effect like loose bearings.

(11) Cars with flat wheels produce the same result as running over a rough track. Defective wheels should be made round by turning or grinding or by the use of an emery insert brake-shoe.

U. M. W. Stubbornly Oppose Labor-Saving Machinery in Pennsylvania Mines

Opposition of the United Mine Workers to the introduction of labor-saving machinery in soft-coal mines is so stubborn that the operators of the central Pennsylvania field felt that they had to make a plea to the U. S. Coal Commission to devise means for safeguarding the union mines in their efforts to keep abreast of present day mining methods.

One glaring instance was cited where, after the operator had obtained a coal-cutting machine and offered to have it tried out, then came to an agreement with the men as to pay rates for those operating the machine, the men called a strike, flatly refusing to countenance the cutting machine in the mine, and forced the operator to remove it.

The central Pennsylvania operators pointed out to the Commission that machines have been allowed in the unionized mines of their district only after their introduction in open-shop mines made competition so severe that it would have been impossible to attempt to go on mining coal with only the old-fashioned pick method, which is far less efficient and economical than machine cutting of coal.

The operators frankly informed the Commission that in their opinion if the coal-mining industry was 100 per cent unionized—as the United Mine Workers have proposed as a panacea for all the ills of the coal industry—there never would be another machine introduced into a coal mine in the country. This would mean, of course, that it would cost much more to produce the coal, and it necessarily would sell for a higher price to the public.

Creosoting Experience at Two Small Mining Plants

Pressure-Treated Timber as Good as New After Thirteen Years—
Untreated Sets Replaced Three to Five Times — Brush-Coated
Timber Still Sound After Four Years — Now Using Dipped Timber

BY THOMAS R. CLARK
Clark Coal & Coke Co., Peoria, Ill.

OBTAINING the proper kind of timber for coal mines each year becomes an increasingly difficult problem for the operator. Only the strongest and best woods will perform the service demanded and, therefore, the buyer is limited in his search for timber. The conditions under which the timbers are used are the worst imaginable, and it is remarkable that they last as long as they do.

In this article reference will be made solely to treatment with creosote. In the Peoria district of Illinois practically no attempt has been made to apply preservatives to timber, and the company with which I am identified is a pioneer in this respect.

Back in 1910 a carload of 6- and 8-ft. pressure-treated crossbars and lags was purchased. They were used to timber a main haulage road; today practically every set is still standing and in good condition. The treated wood is still so hard that it is almost impossible to stick a knife blade into it. Several sets of timbers erected in 1910 have been discarded but practically in every instance in which the timber has been replaced the necessity for its replacement may be ascribed to excessive weight. The main haulage road was not timbered throughout its entire length with creosoted timbers because the supply was exhausted, and untreated timbers had to be used to finish the job.

CREOSOTING DOUBLED FIRST COST OF TIMBER

The untreated timbers have had to be renewed three and, in some cases, four and five times. At the time the creosoted timbers were put in the cost of creosoting amounted to just about what the untreated timbers cost, so it can readily be seen that if these timbers stood twice as long as an untreated set, they had paid for themselves in the material saving alone. However, the big expense in timbering is labor, not only of framing and putting up the timber but handling the dirt and rock that often falls when an old set of timbers is replaced with a new one; thus the economy is many times that of the actual material saved.

Four years ago the lasting qualities of these timbers were so apparent, and investigation proved the results to be so satisfying that it was decided to put in more creosoted timber. It was found that the pressure process was an expensive one; therefore we were forced to try other methods. A few barrels of creosote oil were bought and applied to about twenty sets of timbers that were going into a place where it was necessary to renew timber about every two or three years. A liberal two-coat brush treatment was given to timber that had been barked and seasoned.

Today these timbers are still standing and show no signs of decay; therefore it will be seen that even so slight a treatment as brushing pays. The brush treatment, however, does not always give the desired penetration, and it also is expensive to apply. It seemed to us that a dip of some kind would be the logical

method of overcoming these difficulties, and, accordingly two years ago we built a dipping plant at our Logan mine, which is located at Hanna City. On account of a limited appropriation for this work Fred Waters, the superintendent at that mine, and I, decided that simplicity must be the first consideration.

We first built a cement tank 5x18 ft. in horizontal dimensions and 4 ft. deep; to this was connected a sloping drainage platform of concrete in which were embedded short pieces of upstanding $\frac{1}{2}$ -in. iron, so that the wet timber when placed on the drainage table would not roll back into the tank. In the bottom of the tank several lengths of 1-in. pipe were laid and connected together into one line by return elbows. This line was attached to an exhaust-steam line so that we could heat the creosote. This is all the equipment that was used except that an inexpensive building was put up over the tank to keep out the rain.

PUT TIMBER IN HOT CREOSOTE AND LET IT COOL

The expensive pressure process has as one of its fundamentals the theory that using first hot and then cold creosote will afford the maximum penetration. We decided that, on account of the small quantity of timber which we expected to creosote and the fact that we were not hurried in doing this work, we could raise the temperature of the creosote to a boiling point or near to it and allow the timber to stay immersed until the temperature had cooled down to that of the atmosphere or somewhere near it.

At the Logan mine there was a part of the day when coal was not being hoisted and top men were not busy, and therefore it cost us practically nothing for the labor of creosoting by doing a little of it every day. We kept a two weeks' supply of timber on hand. Consequently the creosote was given an opportunity to soak in thoroughly. This eliminated one of the objections to creosoting timber, namely, that timber men dislike

CONCRETE TANK FOR DIPPING TIMBER IN CREOSOTE

Timber sticks are lowered on a platform into creosote, heated by exhaust steam which is passed through pipes in the bottom of the tank. The creosote is allowed to cool. Thus the stick is given the advantage of both hot and cold treatment. The timber finally is lifted by the hoist and rolled on the draining table, where the free creosote runs off and the timber dries. This table is not shown in the illustration.

handling timber when it is still wet and slimy. The results at this mine were so gratifying that we decided last winter to install a similar plant at Empire No. 2 Mine.

This is a larger mine than that at Hanna City, and to meet those conditions the designs of the plant were changed somewhat and advantage was taken of experience at the Hanna Mine. The same kind of a tank was built, but drip platforms were placed on both sides so that timbers could be handled on either side and more than one run could be made per day. A platform was designed so that the timbers could be lowered into the creosote and lifted out again without having to resort to the laborious and time-consuming process of fishing out the timbers with a pair of hooked poles.

AVERTS BURNS FROM SPLASHING OF CREOSOTE

This also prevented the splashing of creosote on the men who were handling the timber. Creosote burns the skin and causes irritation for several days after the burn is received. The hoist which operates this platform is shown in the accompanying illustration. S. H. Dodd and Benjamin Wyss, superintendent and master mechanic, respectively, designed and built this hoist.

The plant at Hanna City cost less than \$500 to erect and that at Empire No. 2 cost about \$850. The cost of the creosote itself is about the only expense we have had to meet, for the work can be done at odd moments. We have found that once in a while we have to go to the expense of repiling the timber, but this is due to the fact that we have a limited amount of top space, and any mine with adequate timber storage room would not have all this trouble.

Undoubtedly the question will be asked, Do you creosote all the timbers? The answer is, No. We use creosoted timbers only on main entries and cross entries where the timber has to be maintained for four years or more. Good white-oak timber will stand for four years if properly placed, and it would not be of any advantage to put in the more expensive creosoted timbers for this length of time.

SOME WOODS TAKE MORE CREOSOTE THAN OTHERS

Creosote does not work equally well on all woods. White oak and other similarly close-grained woods do not absorb much creosote. Red oak and black oak, we have found soak up creosote successfully. To anyone who is interested in what woods will take creosote, let it be said that nearly all the manufacturers of wood preservatives have bulletins and literature on the subject.

We have made experiments also on the creosoting of the ties used on locomotive haulage roads. We have creosoted the bents supporting a belt conveyor and the linings and guides of shafts. However, we do not care to go on record as yet as to the advisability of this practice, as these timbers have not been in service long enough to prove whether it pays to preserve them with creosote. We believe, however, that the creosoting of these timbers will be highly successful. We have used "Carbosota" exclusively. Undoubtedly, there are other good preservatives on the market, but as we have had success with this brand from the start, we have not tried any other.

Though creosoted timbers are more expensive in first cost than untreated timbers, still they pay such big dividends that they ought to come into more general use. However, even if creosoting or any other method of preserving wood only "showed an even break" on

the ledger, it behooves all of us to make use of them because preservation conserves one of our greatest national resources and the conserving of national resources is one of the greatest patriotic services any good citizen can render.

Well-Placed Shots in Upraise Save Timber

BY J. W. POWELL
Charleston, W. Va.

IN THE issue of *Coal Age* of May 4, 1922, appeared an article entitled "Driving an Upraise Shaft." This article described the method in detail with the help of drawings which showed sectional elevations of the upraise shaft and also a general plan of the shaft and details of the raise.

Though this article was published in May it was not until Aug. 15, 1922, that the work of upraising was commenced. The job which was done by contract, was performed precisely in the manner described in the preceding article, with one exception, that an additional 2-in. pipe was carried up the manway compartment to serve as a speaking tube. This was found to work most satisfactorily. A 15-ft. length of discarded 2-in. steam hose was affixed to the upper end of the speaking tube, which was coiled up when first placed and then uncoiled as the face advanced until there was room for another 10-ft. length of steel pipe.

The main pipe line was then extended up to the platform, and an extension hose attached for the next 10 ft. of advance. This installation made it unnecessary for the workmen upraising the shaft to climb up and down to the platform when they wished to communicate with the men below, for the pipe was flexible and could be extended as needed. Thus much time was saved.

Herewith will be found sketches of the system of drilling and blasting which was employed, showing the number of holes and their position. From thirty-five

FIG. 1—BLASTING DIAGRAM, ORIGINAL SYSTEM
As performed at the start the first shot was placed in the center of the shaft. The others blew straight downward at the center, and the rock fell, as propelled by the explosive, onto the timbers, frequently displacing them.

to forty-four holes were drilled to a round, and the number of holes was governed by the nature of the rock being penetrated.

When the shaft raise was commenced the system used was that shown in Fig. 1, but this did not work quite satisfactorily, principally on account of the breaking holes blasting down on cribbing timbers and thus tending to knock them out of line. The system shown in Fig. 2 then was devised, and this worked well and, in consequence was used throughout the entire work.

It readily will be seen that by blasting the cut shots on the left rib, and then the other rows of holes in succession, all material was blasted away from the timber below and all the violence was exerted against the left-hand rib of the shaft. Thus was eliminated the trouble that had been previously experienced from shots knocking the cribbing timbers out of alignment.

These holes were blasted in order as follows: Nos. 1, 2 and 3, using from 4 to 6 sticks of $\frac{7}{8}$ -in. 60 per cent gelatine dynamite, were fired in succession with straight first- and second-delay fuses; then Nos. 4, 5 and 6, using from 5 to 7 sticks of $\frac{7}{8}$ -in. 60 per cent gelatine dynamite. The lift was then completed by firing all holes in rows Nos. 7, 8, 9 and 10; Nos. 7 and 8 being fired by straight fuses and Nos. 9 and 10 with first-delay fuses.

By this method the shots in each hole had a good chance to break the rock, as care always was taken to see that all holes of the previous round were broken completely to their far ends before the next round was charged. Sometimes it was necessary to charge some of the holes the second time to accomplish this.

It was necessary to drill this large number of holes in order to break up the rock into small pieces, so that they would not block in the rock compartment, which was kept full, only enough being drawn from time to time to clean the raise to a point about 7 ft. below the face. It was predicted by a number of mining men that the job would be troubled by the blocking of the rock compartment.

Although the shaft was raised a distance of 200-ft. vertically, however, the rock never once blocked. This was due to the fact that the rock was blasted into small pieces, far smaller than was expected. Poke holes had been provided every 30 ft. in the partition between the rock compartment and the manway, so that in case the rock should block, the flow of debris readily could be started. However, these poke holes never were used.

SHAFT READILY PLUMBED ON POINTS BELOW

The following method was used in plumbing the shaft: Four stations were placed in the bottom rock of the coal seam, 4 in. from each corner of the manway and hoistway compartments. These stations were located on plugs of hardwood, driven into $1\frac{1}{2}$ -in. holes drilled 10 in. into bottom rock with a jack hammer; points were located on these plugs and all plumbing was carried to these points. The alignment was such that the upraise met the main shaft sinking from above without error.

This raise shaft, 7x14-ft. in the clear, was raised a distance of 200 ft. in ten weeks, working two shifts of ten hours each. This arrangement of working time was found more satisfactory than three shifts of eight hours, as there was only one change of shifts instead of two. This effected quite a saving in the time lost in the changing of shifts and was entirely satisfactory to the men, who preferred it to working the usual three eight-hour shifts.

In order to reduce to a minimum the chances of

FIG. 2—BLASTING SYSTEM AS FINALLY ADOPTED

By starting the lift on the left and shooting toward one side the rock struck the side of the shaft and so did little damage to the timber beneath. At the same time it was broken so fine that it did not block in the battery.

accident from loose pieces of rock falling from above, which is one of the chief hazards in this class of work, the men were equipped with steel helmets which could be bought for 20c. each in the company store. This headgear was uncomfortable at first, but the men soon got used to it and would not attempt to go to the face of the upraise without it. It is necessary after each blast to climb the ladderway to the face and trim down all loose and hanging pieces of rock, and as this material is directly above the workman his head has to be safeguarded.

This was accomplished by the use of the helmet, and the men found they could trim down the loose rock with short and long scaling bars in comparative safety. Though the steel helmets showed numerous indentations, not a man was hurt when using one of them, the only accident occurring when one of the men undertook to go to the face without wearing his helmet. In this instance a small piece of rock fell, causing a slight scalp wound, which laid him off for the balance of the shift.

The shaft was raised from below to a point 23 ft. from the bottom of the shaft being sunk from above. After the distance between the main shaft and the upraise had been reduced the men were withdrawn from the upraise whenever the main shaft was blasted and in like manner the men in the main shaft were removed whenever the upraise shaft below was being blasted.

HERBERT HOOVER has been elected an honorary member of the Czechoslovak Engineers and Architects Association, it is announced by the Federated American Engineering Societies, of which Mr. Hoover was the first president. The honor was conferred at the annual conference of the association held recently at Kosice in recognition of "merit in engineering science and practice and good rendered to our people." Mr. Hoover was chairman of the Committee on Elimination of Waste in Industry, whose report has been translated by the Government of Czechoslovakia and distributed to industries and educational institutions there.

New Equipment

Portable Belt Conveyor

TIME and labor are saved by the use of a new portable belt conveyor which is especially suitable for coal handling. It also is generally applicable to the handling of construction materials and supplies such as stone, sand, gravel, earth, clay and for piling bagged or boxed materials.

The belt travels on a flat track. This flat track moves with the belt and at the same speed as the belt. This

MATERIAL HANDLING CONVEYOR

The track consists of a link-belt chain with crosspieces which may be adjusted to suitable intervals. Flights and belt move at the same speed and there is no friction under the belt.

prevents friction on the belt and insures a flat belt surface. Power-driven brushes prevent any accumulation of material on the belt surface.

This conveyor is manufactured by the Maroa Manufacturing Co., Maroa, Ill., and can be had with several different types of trucks. The equipment can be obtained with or without an electric-motor or gasoline-engine power drive.

New Development in Material Transporting

THE Chisholm-Moore Manufacturing Co., of Cleveland, Ohio, manufacturers of the Cyclone chain hoists, having recently become the sole distributors of the Atlas carryall truck system, have issued a new circular and complete book of instructions which describe the construction and installation of the system.

These new booklets bring out some interesting details with respect to this system of overhead conveying.

The labor of routing and transporting material in a shop, stockroom or warehouse was long ago recognized as one of the principal items of cost. Overhead conveying has done a great deal in cutting costs, speeding up transportation and doing away with the trucking congestion of floors. It also eliminates most of the ordinary accidents caused by factory transportation and prevents wear and replacements of floors necessitated by trucks.

The truck of the Atlas System is suspended from heavy steel hangers, spaced at intervals of 2 to 4 ft., depending upon the load to be carried. In some cases it does not require a superstructure, as it may be sus-

pended from timbers, ceilings, joists or steel trusses by brackets made especially for that purpose. It may readily be suspended from crossbeams in concrete ceilings.

The switching system permits the use of two- or three-way switches. The tongue is pivoted at one end and has steel rollers on the other end which move on a machined surface and drop into a groove, bringing the tongue into perfect alignment with the stationary track.

Trolleys are made in several sizes, ranging from one-half ton to two-ton capacity and are so constructed as to require a low head-room. The trolley frames are so designed that both ends act as bumpers and allow two or more trolleys to operate on the same track without the trolley wheels touching. Trolley wheels have chilled face surfaces and are equipped with Hyatt roller bearings in dustproof housings.

A most novel innovation is the automatic track gap filler used wherever the track passes through a doorway.

Eliminating the Time-Consuming Splice

TIME is a leading element in tonnage. A broken rope means time lost, and time lost means standing cars, an idle tippie and loss of morale. A quick repair and money is saved. To stop a slope for the splicing of a cable is to make a bad tonnage report and a high cost record. Charles N. Finton, of Lykens, Pa., has a splice that seems likely to cut out such delays.

It has no rivets or other devices requiring special tools, and it has no loose or detachable parts to get lost, or be forgotten. It is said to hold the ends of the rope firmly without mutilating the strands or weakening the rope, and anyone can install it. It is so simple that a description will help but little to make its method of operation any plainer. The free end of the rope is bound with butcher twine or other suitable binder.

A socket of suitable size is kept on hand, and the rope is inserted in the open jaws with the wrapped end close to the shank. The jaws are forced together closing about the rope, the coniform teeth penetrating without severing or breaking the strands or fibers, which merely part and entwine the teeth. When using a solid link it is slipped over the shank before closing.

The diameter of the socket when closed decreases as it extends away from the shank, the tapering of the jaws being such that its diameter when closed about the rope is equal to, or less than, the diameter of the rope, thus assuring an easy passage over the pulleys. No tool is needed except a hammer. No dies or swages are necessary. When the rope breaks the socket is taken off by burning out the old rope strands and prying the socket loose.

SOCKET WHICH COUPLES UP A BROKEN ROPE

The socketed portion is of smaller diameter than the rope. A piece of twine and a hammer are all the equipment needed to make the rope ready for use. Only a few men can splice a rope. Any rope rider or roadman can fix this socket and do the work alone and in far less time than any man, however expert, would take to splice it.

Renewing and Lubricating Trolley Wheels

IT MAY be valuable to some of the readers of *Coal Age* to know that the common practice around the mines to replace a worn-out trolley wheel with a new one without renewing the pin or axle of the same is poor practice, because the old pin usually possesses a few flat spots or sharp edges which act as a reamer, thus reducing the life of the bushing to a minimum.

The use of oil on trolley wheels with graphite bushings also should be avoided, as graphite is more or less soluble in all lubricating oils—that is, most if not all lubricating oils possess a sufficient amount of solvent to destroy the graphite bushing. Therefore nothing but a good grade of grease should be used on these bushings, and the best grease usually will be that recommended by the manufacturer of the graphite bushings.

Building Up the Commutator and Core On Mine-Locomotive Armatures

THERE are four general methods of mounting the commutator and core on a locomotive motor-armature shaft. On the more modern motors, especially of the smaller sizes, the iron is built directly on the shaft and held in place by a nut at the commutator end; this arrangement is used mostly on the ventilated type motors having longitudinal ventilating ducts through the core and a fan at the rear end. Where space is available the spider type of construction also is used. The other two types mentioned below have been superseded, as it is necessary to disconnect the armature leads from the commutator when a shaft is to be replaced. Some of these older type shafts have wiper rings screwed on the shaft, but this practice has been changed to a shrunk-on type of wiper on the more modern motors.

Iron Built on Shaft, Nut at Commutator End.—In Fig. 1 is shown the construction in which the armature iron and commutator bushing are mounted directly on the shaft and depend upon the press fit, the key, and

FIG. 1—IRON BUILT ON SHAFT NUT ON COMMUTATOR END
The iron is placed directly on the shaft. This is the usual construction for armatures of small diameter.

the locknut at the commutator end to keep them in place. The fan and commutator-end wiper ring, which have been shrunk on, are removed by heating them with one or more blow torches (keeping the shaft cool by wrapping it with wet asbestos) and driving them off with a hammer and chisel.

After the fan and wiper are removed, clamp the core and commutator together by placing over the shaft two pieces of iron pipe, one on each end, large enough to clear the armature nut and long enough so that the plates placed over the shaft and against the pipes will clear the end of the commutator and the end of the coils at the pinion end, as shown in Fig. 5. Bolt the plates together, using four or more bolts just clearing the outside of the armature. Take special care to cut the pipes off square and to pull the bolts up evenly to prevent warping the core when the shaft is removed.

FIG. 2—IRON BUILT ON A SPIDER

This is the construction commonly used on mine locomotives and is claimed to afford better ventilation.

Allow clearance enough at the pinion end between the plate and the shaft so that the key will clear.

Another form of clamp has rings machined to fit the commutator and rear coil support, with bolts through the longitudinal vent ducts. When the clamp is in place, back off the locknut at the commutator end, press out the shaft by applying pressure at its commutator end, and replace with a new one. With the new shaft in the core, apply and tighten the armature nut, remove the clamp and shrink on the fan and wiper ring.

Spider Construction.—In Fig. 2 is shown the construction where the armature iron and commutator bushing are mounted on a spider, which is, in turn, mounted on the shaft. The commutator end wiper and the fan are shrunk on. To remove the shaft, take off the pinion end wiper ring (or fan, if a fan is used) by heating as described above. With this type it is not necessary to remove the commutator end wiper, as it comes off with the core. Pressure is applied at the commutator end of the shaft in removing. The new shaft is pressed in, and after it is in place the commutator end and pinion end wiper or fan are shrunk on. This method applies both to spiders with separate rear-end bells and to spiders with rear-end bells cast integral.

Iron Built on Shaft, Nut Between Commutator and

Core.—In Fig. 3 the commutator spider and core are shown mounted directly on the shaft with a ring nut between the commutator and the core. With this type of construction, it is necessary to lift the armature leads out of the commutator neck, remove the wiper rings and pull the commutator first. The commutator is provided with tapped holes for bolts to aid in this operation. After the commutator is removed, clamp the core together, using a modification of the clamping device shown in Fig. 5, back off the ring nut, and press out the shaft, applying pressure at the commutator end. After the new shaft is in place, apply the ring nut to secure the core, press on the commutator, shrink on the wiper rings and reconnect the windings.

Iron Built on Shaft, Not at Pinion End.—In Fig. 4 is shown a type in which there is a shoulder on the shaft between the commutator and the core. In this case it is necessary to disconnect the windings the same as described in connection with Fig. 3. Remove the wiper rings and pull the commutator as described above. Clamp the core together, back off the ring nut at the pinion end and press out the shaft, applying pressure at its pinion end. Press in the new shaft and apply the ring nut, which should be drawn up tight before the clamp is removed. Replace the commutator and reconnect, then shrink on the wiper rings.

FIG. 3—IRON BUILT ON SHAFT NUT BETWEEN COMMUTATOR AND CORE

It is important to lock the nut properly to retain the core in position and prevent any vibration.

Precautions.—In connection with the replacing of shafts of locomotive motor armatures, the following points should be kept in mind:

- (1) A little white lead on the shaft at the fit before pressure is applied acts as a lubricant and prevents rust.
- (2) New shafts should have fillets at all changes in diameter, as they tend to prevent breaking of the shaft.
- (3) New shafts should be made about 0.004 in. larger than the original shaft at the press fit, to insure the proper tonnage in pressing them in.
- (4) Check the clearances between the top of the key and the keyseat in the core to prevent binding at this point.
- (5) Chamfer the start of the commutator bore to allow the shaft to enter straight and get an even start.
- (6) Shafts should be pressed in at approximately

FIG. 4—IRON BUILT ON SHAFT SHOULDER BETWEEN COMMUTATOR AND CORE

In repairing the armature shaft it is necessary to avoid sharp changes in diameters, as these points usually develop into flaws.

FIG. 5—CLAMP FOR HOLDING ARMATURE WHILE SHAFT IS REMOVED

This device will facilitate the work when the shaft is to be replaced.

20 to 25 tons on motors from 25 to 50 hp. and about 40 to 50 tons for sizes above 50 hp.

(7) Wherever possible, the armature nut should be removed and replaced while the clamps are in place.

(8) Shafts will press out approximately 1.5 to 2 times the tonnage used when they are pressed in, because of slight rusting and flowing of metal.

(9) The press fit will vary, depending upon the material of the core. Steel or malleable iron can safely stand a higher tonnage than cast iron.

An Accomplished Feat of Drying Out an Electric Mine Locomotive

DURING the second week of March, 1922, a heavy downfall of rain flooded the lower levels of our Hazleton No. 1 slope and completely submerged one of the 7½-ton Baldwin-Westinghouse electric locomotives for a period of 34 hours.

As there was great demand for coal at that time and a large portion of the production of this colliery depended upon this locomotive, it was necessary to have it put back into operation with the least possible delay.

To accomplish this, it was decided to apply power to the normal motor circuits and set up enough heat to dry out the equipment without dismantling the locomotive. It was accordingly taken to a place of safety where men and material were in readiness to start the drying process. The water was first drained from both motors and the brakes were applied to prevent the locomotive from moving. Power was then obtained from the 275-volt trolley line through 12 frames of resistance grids. By turning the reverse drum to a series position to connect both motors in series and turning the controller on one notch, the current was maintained at 65 individual parts.

This method proved very successful as it required only 16 hours to dry out the locomotive completely and place it in operation.

Up to date, no bad effects have resulted from the amperes. This arrangement furnished sufficient current to raise the temperature in the windings and also the motor circuits enough to drive out the moisture very quickly, instead of the more lengthy process of taking the equipment apart and applying external heat to the submersion and drying.

F. E. CASH, MINING ENGINEER, attached to the Pittsburgh experiment station of the U. S. Bureau of Mines, recently visited and inspected thirteen coal-stripping operations in Harrison and Jefferson counties, Ohio, in connection with a detailed study of methods employed in the various coal-stripping operations in the United States which is being made by the Bureau of Mines.

Problems of Operating Men

Edited by
James T. Beard

Supporting Roof Over Roadway to Avoid Accidents

Method Much Used in England—Cross-bars Supported on Eyebeam Stringers Resting on Steel Bars Set in Rib

REFERENCE has frequently been made in *Coal Age*, regarding the necessity of avoiding the use of posts for supporting the roof on roadways. It is readily recognized that many fatal accidents have occurred by reason of a derailed car knocking out one or more posts at the side of the road and causing a roof fall. To prevent this, it is necessary to find other means of supporting the crossbars than resting them on full-length posts standing on the bottom.

The most common form of timbering adopted for that purpose is the use of short legs set in hitches cut in the rib. This method has given good satisfaction where the coal is hard. Again, the plan is adopted of cutting hitches in the coal at the roof, or in the formation just above the coal and slipping the ends of the crossbars into these hitches, and wedging them tightly

FIG. 1—TWO WAYS OF SUPPORTING CROSSBARS

in place. These two methods are shown in Fig. 1, the one on the left and the other on the right of the figure.

As has been pointed out in *Coal Age*, the success or failure of these methods depends on the nature of the coal and its ability to support the pressure thrown on it by the timbers. I have known of instances where the coal had very pronounced cleats that were well developed and when the timbers took the weight these cleavages running parallel to the entry opened up and slabs of coal fell into the road, bringing down the timbers and great quantities of loose slate.

METHOD OF ROOF SUPPORT USED IN ENGLAND

In this connection, permit me to describe what to my mind is an ideal method of timbering a main haulage road. As far as my knowledge goes, the plan has not been adopted in this country, but it is one that is frequently employed in England where it has given success. Briefly described, the method is as follows:

At a certain uniform height above the rail, chosen to conform to the conditions of haulage in the mine, holes are drilled in the ribs on each side of the road. Jackhammer drills are used for the purpose. These are operated by compressed air, the compressor being mounted on a truck running on the mine track, so that

it can be moved from place to place as may be necessary.

The depth of the holes and the distance apart will, of course, depend on the hardness of the coal and the character of the roof, respectively. As shown in Fig. 2, short lengths of steel bars are driven into these

FIG. 2—CROSSBAR RESTING ON EYEBEAM STRINGERS

holes and allowed to project several inches into the entry; and on the bars are placed the iron rails or stringers, which are to form the supports for the crossbars spaced at equal distances apart.

To my mind, the entire plan is simple and effective. When the work is once complete there is little additional expense to keep the road in good condition. Where the roof is frail or tender, lagging must be used over the crossbars. Where cavities occur in the roof, the space must be filled with lagging that is built up crosswise, in successive layers, after the usual log-cabin style of timbering such places.

GEORGE BOWKER.

Relation of Mine Supplies to Favorable Working Conditions

Ordering unneeded supplies is waste of material—System in care of supplies—Effect on working conditions and successful operation of the mine.

THERE is a vast distinction between getting what one needs and what one wants and just here lies a problem for the man who pays the bills. The waste at the average coal mine is very large and, in respect to at least one class of supplies, observation shows that more is wasted than is actually used.

There is a tendency among foremen of large mines to make out or sign a requisition for material without giving special thought to what is really needed. Trackbosses, timbermen and others in charge of particular work, usually make out a list of supplies for their own use. The list is given to the assistant foreman and turned over by him to the foreman, who then makes out and signs a requisition for the material and hands it to the superintendent or to his office clerk.

The chief thought of the man on the job who makes out the original list is to have plenty of material at hand with which to work; and if these supplies are given proper care it cannot be said there is any special waste in so doing. There is always a greater loss to the company when there is delay in waiting for needed material and, in many instances, the situation results in some makeshift construction that is highly unsatisfactory and means an increased cost of production.

CARING FOR ALL TOOLS AND SUPPLIES IN USE

In order to overcome this condition and lessen the waste of material, many mines now require that all tools and supplies shall be taken to the assistant foreman's shanty, each evening. All small articles such as spikes, bolts and nails must be kept in buckets provided for that purpose. The buckets are made by the blacksmith, who cuts off the tops of empty powder kegs and puts a handle on each. The kegs are free to all the workers in the mine who are expected to use them.

This system has a good effect in more ways than one. Where no special plan is followed, workmen will always be found wandering about the mine searching for one thing or another that they require. The time wasted in this manner increases the cost of labor and, in the end, the operator pays for what is needed whether he buys it or not.

Another phase of the question that I wish to mention before closing is the indirect effect on the men when compelled to work under such conditions. It develops a lassitude and fatigue in every worker. They become listless and much of their work is performed in an aimless manner. A man in this condition does not possess an active mind. His memory is poor and his work becomes monotonous even to drudgery.

In my rounds I have carefully observed men working under favorable conditions and others at a disadvantage. The low-coal regions offer the greatest number of adverse conditions; and, I might say, it is rare to find a really efficient low-coal operation.

In a low-coal mine the first consideration should be to develop sufficient entry area to enable the circulation of an ample air current and facilitate the transportation of men and material. Efficient operation requires the brushing of roads and travelingways to give good headroom. The mine, including all working places, must be well drained and ventilated to insure favorable working conditions and successful operation.

Pikeville, Ky.

GEORGE EDWARDS.

Disposal of Waste Mining Twin Coal Seams

Drive double rooms 30 ft. wide with two tracks—Take out both seams in first working—Build waste between tracks for support of roof.

ALLOW me to offer a suggestion on the proposition presented by a Kentucky superintendent and answered in *Coal Age*, May 10, p. 762, regarding the safe and economical working of a twin coal seam, consisting of a bottom bench of coal 52 in. thick and a 30-in. top bench, the two benches being separated by 30 in. of slate parting which he terms "middleman." The seam is said to be overlaid with a strong sandrock roof, while the slate parting, is weak and cannot be supported for any length of time.

To attain the maximum recovery of coal from this seam with due regard for safety and efficiency, I would suggest driving double rooms 30 ft. wide, with track

laid on each side of the room close to the rib. My plan would be to take out both the top and bottom seam in the first working, dropping the slate as the face is advanced and building this refuse in the shape of a solid packwall between the tracks.

The center slate or parting, which is 30 in. thick in the solid will occupy 50 per cent more space when broken and represent a thickness of $1.5 \times 30 = 45$ in., over the entire area of the room. But, allowing for two tracks each 8 ft. wide, in this 30-ft. room, leaves but 14 ft. for the width of the packwall between the tracks. The corresponding thickness of the slate refuse will therefore be $45 \times 30/14 = 96$ in., say 8 ft.

The total thickness of the seam, including the two benches of coal and the slate parting, is 9 ft. 4 in. I estimate that the broken slate, together with the other refuse generally produced in mining, will practically fill this space between the tracks and, with such timbering as may be needed will form ample support for the roof, in turning 30-ft. rooms.

PACKWALL ASSISTS VENTILATION

The packwall will also materially assist in conducting the ventilating air current to the working face. For

DRIVING DOUBLE ROOMS

the support of the gangway, as shown in the accompanying figure, a small pillar or entry stump should be left in the mouth of each room.

If found practicable, the work of extraction should be started by mining the center slate for a distance sufficient to free the coal, so that it can be more easily blasted and gotten out in better shape for the market. This will, of course, necessitate the setting of temporary sprags to support the top coal until that is taken out. Also, if desired, the room tracks may be turned and extended along the face of the room and advanced from time to time as the work proceeds.

TRACKS AVAILABLE FOR DRAWING PILLARS

When the rooms have been driven the required distance the position of the tracks will greatly facilitate the extraction of the pillars. Here also, if roof conditions permit, the tracks in adjacent rooms can be turned and extended along the face of the pillar. Having the cars available along the face line not only lessens the breakage of the coal, but reduces unnecessary labor to a minimum by decreasing the distance the miner must handle his coal.

The depth of the seam is not given in the inquiry, but this factor would have to receive the fullest consideration in determining the relative width of rooms and pillars. Allow me to say in closing that the method of working suggested in the reply to this inquiry does not appeal to me as the most efficient. The plan there suggested was to mine the bottom seam of coal and take down the slate parting in the first working.

It was claimed that the top coal would make a good roof in driving the room its distance. The upper seam would then be taken down when drawing back the pillars. To my mind, when the necessary space is

allowed for the road, there is not sufficient available space remaining in the room for the stowage of the waste, which would have to be loaded out in cars or stored in some other part of the mine, either of which would be expensive. In addition to this, there would be a considerable loss of coal resulting when the top bench is dropped on to the fallen slate, and there would be difficulty in setting the necessary timbers.

Victoria, B. C.

JAMES DICKSON.

[In answer to the suggestion of there not being sufficient space available for storing the refuse, let us assume a 24-ft. room with an 8-ft. roadway, leaving 16 ft. of available space at the side of the track. Then, allowing as before, an increase of 50 per cent in the volume of the broken material, the 45 in. corresponding to the 30 in. of slate parting would, in this case, give a thickness of $45 \times 24/16 = 67\frac{1}{2}$ in. for the height of the

packwall at the side of the track. But the available height when the 52 in. bottom coal and 30 in. parting is taken out, is 82 in.

Again, it was stated, in our reply to the inquiry, that the fallen slate would be gobbled at the side of the track, which should, of course, be done before the top seam is taken down.

Once more, when drawing back the pillars and taking down the top seam, it would only be necessary to handle over the slate, which is loosely piled, and throw it back in the waste behind. It would not need to be "loaded out in cars or stored elsewhere in the mine." At least one advantage of the plan first suggested is a saving of timber and trackage. There is not the need of building solid packwalls out of the waste, which is loosely piled. Also, the props for the support of the roof are 6 ft. 10 in. instead of 9 ft. 4 in.—EDITOR.]

Inquiries Of General Interest

Exhaust vs. Blowing Ventilation, Slope Mine

Elevation at Top of Shaft Higher Than Mouth
of Slope—Natural Air Column in Shaft Assists
Ventilation in Winter but Retards It in Summer

THERE is a question that has puzzled me for some time past and I have not, as yet, been able to get a satisfactory explanation of it from others. May I, therefore, ask the privilege of submitting it to *Coal Age* and readers.

I am employed at a slope mine that is ventilated by a large reversible fan located at the top of an air shaft. The mouth of the slope is in the valley, while the air shaft has been sunk on the mesa, at a point a considerable distance back from the mouth of the mine. The elevation of the top of the shaft is about 500 ft. above the entrance to the slope. The depth of the air shaft is 900 ft.

The fan was installed to run ordinarily as a blowing fan; but, on certain occasions, we have operated it as an exhaust fan. At such times, I have been surprised at the large volume of air in circulation in the mine, although the fan was running at the same speed as before.

Kindly explain the reason for this observed difference; and state if it would not be an advantage to operate the fan continually on the exhaust principle of ventilation.

FIREBOSS.

_____, Colo.

The arrangement described by this correspondent is clearly illustrated in the two diagrams shown, side by side, in the accompanying figure. On the left, the fan is shown as blowing the air into the mine, the air shaft being the downcast, while the slope is the upcast. This is said to be the ordinary arrangement of the circulation in the mine.

On the right of the figure, the fan is shown as exhausting the air from the mine, the air shaft then

being the upcast, while the slope is the downcast for the entire mine.

We will assume that it is winter and the temperature of the outside air is, say 10 deg. F., while the average temperature in the mine is 60 deg. F. When the fan is blowing air into the mine, in this case, the shaft is filled with the cold outside air having practically the same temperature as exists on the surface. But, in its passage through the mine, the air current is warmed and the temperature of the air filling the slope is the same as that given for the mine (60 deg. F.).

Now, observe that the upper 500 ft. of the shaft column is balanced by the corresponding 500 ft. of outside air above the mouth of the slope. Below this level,

ILLUSTRATING EFFECT OF NATURAL AIR COLUMN

the remaining 400 ft. in the shaft column is partly counterbalanced by the same vertical height of slope column. Therefore, the effective head of air, in this case, is only 400 ft. and the motive column, in terms of the outside air, is therefore

$$400 \frac{60 - 10}{460 + 60} = \frac{400 \times 50}{520} = 38.46 \text{ ft.}$$

But, the weight of a cubic foot of the outside air, for a temperature of 10 deg. F., assuming a barometric pressure of 30 in., is $(1.3273 \times 30)/(460 + 10) = 0.0874$ lb.; and the pressure due to the motive column just found is $38.46 \times 0.0874 = 3.26$ lb. per sq.ft., nearly.

On the other hand, when the fan is exhausting air from the mine, the entire depth of the shaft is filled with the warm air from the mine, while the slope is filled with the cold outside air. In such case, the effective head of air column is the full depth of the shaft, 900 ft., since this warm shaft column is now in balance with the slope column and the 500 ft. of outside air column extending upward to the level of the top of the shaft.

Hence, again computing the motive column, in terms of outside air gives, in this case,

$$900 \frac{60 - 10}{460 + 60} = \frac{900 \times 50}{520} = 86.54 \text{ ft.}$$

The pressure corresponding to this motive column is, then, $86.54 \times 0.0874 = 7.33$ lb. per sq.ft.

Finally, since the quantity of air in circulation varies as the square root of the pressure, the quantity ratio will be equal to the square root of the pressure ratio. In the present case, the ratio in which the circulation would be increased when the fan is exhausting air from the mine would be $\sqrt{7.33/3.26} = 1.5$. In other words,

the circulation would be increased 50 per cent, by reason of the greater effective air column when the fan is exhausting.

In the summer season, the conditions are generally reversed, the mine temperature being usually lower than that of the outside air; and, in that case, the effect would be to retard the circulation produced by the fan in about the same ratio. That is to say, the fan exhausting, in summer, would produce about two-thirds of what it would produce when blowing, for about the same difference in temperature between the mine air and the outside atmosphere.

Examination Questions Answered

Anthracite Foremen's Examination, Districts 3-7 incl., 1923

(Selected Questions)

QUESTION—How many cubic feet of air will pass per minute along an airway 7 ft. high and 12 ft. wide, the velocity of the air current being 350 ft. per min.?

ANSWER—The sectional area of this airway is $7 \times 12 = 84$ sq.ft. Then, assuming an average velocity, at this point, of 350 ft. per min., the volume of air passing is $350 \times 84 = 29,400$ cu.ft. per min.

QUESTION—In making your rounds of the working faces, what instructions would you give to the miners in order to prevent accidents from blasts?

ANSWER—Where the miners are permitted to charge and fire their own shots no hole should be charged or fired until it has been examined by the mine foreman, assistant foreman or other competent person authorized to perform that duty and permission is given to fire the shot. Careful instructions should be given to each miner in regard to the weight of powder to be used and the manner of charging and tamping the hole. The miner should also be instructed not to use too short a fuse, or bite off the match of a squib, or dip it in oil to hasten the firing of the shot. His tools should be examined to see that his bits conform to the proper gage and are not worn down so that the bore of the hole will be too small to allow the cartridge to be pushed into the hole without jamming; and to see that he is using a wooden tamping bar, or a bar that is copper-tipped. He must be instructed never to use two kinds or grades of powder in the same hole, or to fire two shots in the same place, at the same time, when one is a dependent shot. It is important to see that the miner is supplied with and uses proper tamping material. He must be instructed never to use coal dust or slack for that purpose.

QUESTION—Under what conditions in a mine does the anthracite law require the mine foreman to withdraw the men under his charge?

ANSWER—The law requires (Art. 12, Rule 8) that when a mine is found to be in a dangerous condition by reason of gas or other cause whatsoever, every precaution must be taken to insure the safety of the

men; and all persons shall be withdrawn from the mine or section of the mine where such danger exists and not permitted to return, until the danger has been removed and the mine examined and found to be safe for work.

QUESTION—What particular dangers are there in pillar drawing in a mine giving off explosive gas?

ANSWER—The drawing of pillars in a mine generating gas will often be accompanied with an increased outflow of gas, owing to the settlement of the roof opening new fissures or breaks that permit the gas to escape into the workings. The danger is more imminent where the gas is contained in the roof strata or an overlying seam. If the gas comes from the floor, some increase in the outflow will be caused, at times, by the excessive pressure brought on the ends of the pillars.

QUESTION—In a mine where 600 persons are employed, (a) what would be the minimum quantity of air required? (b) How many separate splits of the air current will be required to comply with the anthracite mine law?

ANSWER—(a) The anthracite law (Art. 10, Sec. 3) requires a minimum quantity of 200 cu.ft. of air in circulation, per minute, for each person employed in the mine, and as much more as the conditions may require. For a mine employing 600 persons, this will mean a minimum air volume of $600 \times 200 = 120,000$ cu.ft. per minute.

(b) The law also requires (Sec. 6) the ventilation to be so arranged that not more than 75 persons will be employed at the same time on the same current. The number of splits necessary in the employment of 600 men in a mine is, therefore, $600 \div 75 = 8$ splits.

QUESTION—What are the provisions of the anthracite law relative to the examination of old and new workings of a mine?

ANSWER—The anthracite law (Art. 12, Rule 4) requires the examination, by the mine foreman or assistant foreman, at least once a week, of all accessible parts of abandoned portions of the mine, and the removal of any dangers found existing therein. A report of the examination must be entered in a book kept for the purpose and signed by the person making the examination.

Rule 5 of the same section of the law requires the mine foreman or assistant foreman to carefully examine all working places, traveling roads and other places where danger might exist, each morning, before the men enter the mine for work. The examination must be made within three hours of that time, using a safety lamp for the purpose. A report of the examination must be entered in a book kept for that purpose and signed by the person making the examination.

Annual First-Aid and Mine-Rescue Meet at Salt Lake City Is Largest Ever Held

"The safest men in America"—nearly 500 of them—demonstrated in Salt Lake City, Aug. 27-29, the skill that coal-mining men have learned in the vital art of rescuing and treating mine-disaster victims. It was the sixth annual International First-Aid and Mine-Rescue Meet. No larger meet has ever been held. In all, 54 first-aid teams from coal and metal mines in 14 states and Mexico and 21 mine-rescue teams—almost every one chosen by state and district elimination contests during the early summer—were there doing their best, and of them all the team which the Benton district of Illinois sent took highest honors with a team from the Anaconda Copper Co. ranking second.

The meet was noteworthy for several reasons. It was the first in which a team from Mexico took part, though Mexican teams have been spectators before. This time the Real Del Monte y Pachuca Co., of Pachuca, Hidalgo, Mex., sent a team which won much attention and third prize in the mine-rescue contest among 21 teams. Interpreters were used in order to translate the written problems to contestants. The Mexican score was 83. Also the meet was the first in which a negro team was entered. The one this year was sent by Local 1228 of the United Mine Workers at Dewmaine, Ill. The team was disqualified in mine-rescue because it grew panicky when a piece of apparatus went wrong in the outdoor gas gallery.

NO ACCIDENT OF CONSEQUENCE TO MAR MEET

Also it was noteworthy that the whole meet was engineered by the Bureau of Mines without a single accident of any consequence and with much more dispatch than most previous contests of the sort. Speed in the mine-rescue contest of the last day was gained by permitting, at times, as many as three teams to be in the wooden gas gallery at once. A team would enter while another was half way through its problem and a third was emerging at the end of its 12- or 15-minute trip. No team was rushed, however. Plenty of time was allowed and there were no interferences. The ten judges of the rescue contest, working in pairs, were stationed along the route through the gallery, so that every team worked at various stages of its problem under the eyes of every judge. This tended to produce fairer average scores.

The meeting opened on Monday morning, Aug. 27, in the big pavilion at Bonneville Park with inspection of equipment. For the rescue teams this consisted of an examination of each team member by ten judges working in pairs. This plan was intended to raise the factor of fairness in scoring by drawing in many judges' reports on each team instead of assigning only two or three judges to each team. All afternoon Monday and Tuesday the fifty-four first-aid teams worked out their problems on the floor of the pavilion. Wednesday morning the rescue teams began working in the outdoor gallery in the morning. The last one reported out at 1 p.m. and the meet was over except for the tabulation of judges' scores and the announcement of awards at the banquet that night.

Governor Charles R. Mabey, of Utah, speaking at the banquet, told the first-aid and rescue teams that no greater work for mankind can be done than that of training men as the Bureau of Mines and other agencies are now doing. He said that about 60,000 men in this country have already received training in first-aid work and 20,000 in mine rescue.

"It behooves every mine owner to thoroughly equip his mine with the best safety appliances known," said the Governor, "and it behooves every miner to obey safety rules and laws as completely as a soldier obeys army regulations."

In high tribute to the trained safety men of the country's mines, the Governor said they, above most mortals, are displaying in their work that spirit of which the Bible says, "No greater love hath any man than that he give his life for his friend."

Ross Beason, president of the Salt Lake City Commercial Club, presided. The other speakers were Mayor C. C. Neslen, of Salt Lake City, James H. Ball, representing the mining committee of the Chamber of Commerce, and W. Mont Ferry, who spoke for the operators of Utah.

D. J. Parker, of the Bureau of Mines, made the awards at the close of the banquet speaking. The awards follow:

First Prize, with honors, in combination mine-rescue and first-aid work (cup donated by Boyd Park Jewelers of Salt Lake City and silver cup from National Safety Council)—First-Aid Team 41 and Mine Rescue Team 1, Benton District, Benton, Ill.; Captain, Mungo Marshall; rating, 94.

Second Prize in Combination—First-Aid Team 33 and Rescue Team 13, Independent Coal & Coke Co., Kenilworth, Utah; Captain, J. R. Roaf; rating, 92.66½.

Third Prize in Combination—First-Aid Team 18 and Mine Rescue Team 3, Pacific Coast Coal Co., Black Diamond, Wash.; Captain, R. F. Snook; rating, 88.83.

Joseph A. Holmes special trophy for the company whose first-aid team and separate mine-rescue team get highest average rating in both first aid and rescue—Union Pacific Coal Co. First-Aid Team from Cumberland, Wyo., under Captain Lyman Fearn; rating, 94.08½, and Rescue Team from Hanna, Wyo., under Captain Thomas Meekin; rating, 76.

Mine Rescue.—First prize, Team 1; Captain, Mungo Marshall, Benton district, Illinois; rating, 95½. Second, Team 13; Captain, J. R. Roaf, Independent Coal & Coke Co., Kenilworth, Utah, rating 91½. Third, Team 6; Captain, Manuel Ramirez, Real del Monte y Pachuca Co., Pachuca, Hidalgo, Mexico; rating, 83.

ANACONDA COPPER TEAM WINS FIRST-AID CONTEST

First Aid.—First prize, Team 8; Captain, L. J. Deranleau, Anaconda Copper Mining Co., Great Falls, Mont.; rating, 97.91½. Second, Team 14; Captain, W. E. Wolfe, Clinchfield Coal Corp., Wilder, Va.; rating, 97.41½. Third, Team 24; Captain, Claude Alley, Clinchfield Coal Corp., Dante, Va.; rating 97.16.

Special prize of a cup for first aid winner of Rocky Mountain region.—Team 8; Captain, L. J. Deranleau, Anaconda Copper Mining Co., Great Falls, Mont.

State First-Aid Championships:

Alabama—Won by Team 40 representing the Woodward Iron Co., Mulga; Captain, W. L. Beaveret.

Colorado—Team 32, Colorado Fuel & Iron Co., Walsen; Captain, Dave Davis.

Illinois—Team 27, Southern Coal, Coke & Mining Co., Belleville; Captain, Frank Westwood.

Indiana—Team 59, Indiana Coal Operators' Association, Terre Haute; Captain, James Harkis.

Idaho—Team 49, Federal Mining & Smelting Co., Mulden; Captain, Axel Johnson.

Iowa—Team 21, Red Rock Coal Co., U. M. W. A., District 13, Melcher; Captain, R. E. Price.

Kansas—Team 10, Western Coal & Mining Co., Pittsburg; Captain, Louis Trego.

Louisiana—Team 54, Standard Oil Co. of Louisiana, Baton Rouge; Captain, R. C. Thorgeson.

Mexico—Team 12, Real Del Monte y Pachuca Co., Pachuca, Hidalgo; Captain, Sr. Manuel Ramirez.

Missouri—Team 19, Pierce Hess Coal Co., Bevier; Captain, Thomas A. Munn.

Montana—Team 8, Anaconda Copper Mining Co., Great Falls; Captain, L. J. Deranleau.

New Mexico—Team 53, Phelps Dodge Corp., Dawson; Captain James English.

Oklahoma—Team 5, Oklahoma Coal Operators and U. M. W. A., District 21, McAlester; Captain, L. Thompson.

Pennsylvania—Team 13, Bertha Consumers Co., Johnetta; Captain, T. L. Holsing.

South Dakota—Team 45, Homestake Mining Co., Lead; Captain, E. E. English.

Utah—Team 33, Independent Coal & Coke Co., Kenilworth; Captain, J. Richardson Roaf.

Virginia—Team 14, Clinchfield Coal Corp., Wilder; Captain, W. E. Wolfe.

West Virginia—Team 31, Davis Coal & Coke Co., Thomas; Captain, M. J. Brennan.

Washington—Team 18, Pacific Coast Coal Co., Black Diamond; Captain, B. F. Snook.

Wyoming—Team 42, Union Pacific Coal Co., Cumberland; Captain, Lyman Fearne.

Mine Rescue State Champions:

Illinois—Team 1, Captain, Mungo Marshall, Benton District.

Idaho—Team 9, Hercules Mining Co., Burke; Captain, Joe Revelli.

Mexico—Team 6, Real del Monte y Pachuca Co., Pachuca, Hidalgo; Captain, Manuel Ramirez.

South Dakota—Team 20, Homestake Mining Co., Lead; Captain, Orville E. Dunn.

Utah—Team 13, Independent Coal & Coke Co., Kenilworth; Captain, J. R. Roaf.

Wyoming—Team 4, Union Pacific Coal Co., Hanna; Captain, Thomas Meekin.

Washington—Team 3, Pacific Coast Coal Co., Black Diamond; Captain, B. F. Snook.

Washington Views Strike Calmly; Brief Suspension Expected

Thinks Actual Tonnage Loss Will Be Small—
Coolidge to Give "Co-operation" and "Support"
—Commission Confers on Bituminous Report

Despite suspension of operations in the anthracite field, official Washington faces the situation with equanimity, feeling that a distinct advance toward bringing the operators and miners into agreement has been accomplished by Governor Pinchot and optimistic that the suspension will be of brief duration. Federal officials evidently were mentally prepared for news that the Pennsylvania executive's offer had not been accepted wholly immediately. They had recognized that Saturday, the first day of the agreement-expiration period, is a half holiday in the collieries and that Monday was a holiday, thus giving time for developments without actual loss of much tonnage in those days.

Action toward putting into effect the machinery by which bituminous coal and coke might be sent into the anthracite-consuming regions was delayed. It was pointed out that even should the suspension in the anthracite field continue there would be no shortage of fuel for some time due to accumulated stocks. The desire evidently was to do nothing which might interfere with a successful conclusion of negotiations by Governor Pinchot remained.

Nevertheless, a White House spokesman represented President Coolidge as determined to use "all the resources" of the federal government to supply fuel to any section of the country needing it should the suspension of anthracite mining be prolonged. The President was represented as still hopeful of a settlement but as viewing the alternative calmly. The chief executive has given Governor Pinchot "full co-operation" in his efforts to harmonize the contending groups, it was said, and it was further asserted that President Coolidge will continue to give the Governor "full support," these two terms, "co-operation" and "support" being said to describe fully the President's attitude toward the negotiations initiated by the Pennsylvania Governor.

The members of the Coal Commission devoted several days during the week to consideration of their report on bituminous coal, which is to be submitted on or before Sept. 22, the date on which the Commission will expire by limitation. Reports from the staff on various phases of the soft-coal question were studied.

As a step in preparation for eventualities, the Bureau of Mines issued a statement by O. P. Hood, chief mechanical engineer, on the use of substitutes for anthracite.

Rocky Mountain Coal Institute Holds Annual Meeting

Seventeenth Gathering, at Salt Lake City, Featured by Discussions on Track Bonding, Mine Safety and Low-Temperature Distillation

The scope of the Rocky Mountain Coal Mining Institute is broad. It proved broad enough at the seventeenth meeting of the Institute in Salt Lake City, Utah, Aug. 27 to 29, to include subjects ranging from discussions of safety in mines and the technicality of track bonding and of low-temperature distillation of coal along the lines now followed by Henry Ford, clear out to swimming in the Great Salt Lake and banqueting with the first-aid and mine-rescue teams of the continent that were also meeting at Salt Lake City. The Institute had a large attendance.

The sessions of the Institute were fitted into the program of the International First-Aid and Mine-Rescue Meet so that the members could watch the miner teams in the afternoons and hold their own sessions in the mornings. Little business was transacted at the meeting but the Institute, under President George B. Pryde, decided to work out a plan for organizing Institute chapters in each Rocky Mountain mining district which would try to draw all sorts of coal-mining men, right down to miners working at the faces, into the organization.

GEORGE B. PRYDE

President Rocky Mountain Coal Mining Institute

The Institute closed its meeting on the night of Aug. 29 with a banquet for members and their ladies. For this festivity a hall was used adjoining the great banquet hall in the Hotel Utah in which the first-aid and rescue teams were banqueting.

The Institute adopted resolutions of sympathy for P. J. Quealy, president of the Kemmerer Coal Co., and for the suffering towns of Kemmerer and Frontier, recently stricken by the explosion in Frontier mine. The grief of the Institute over the death of Carl Allen and of Prof. R. C. Hills was expressed in other resolutions.

Rail bonding in coal mines of this country is uniformly and inexcusably bad, according to D. C. McKeenhan, chief electrical engineer of the Union Pacific Coal Co. In his paper, which was read to the Institute at its opening session by F. A. Rank, he recited some of the experiences of his company with various kinds of bonds until it standardized on electric welded bonds in 1919.

The first arc-weld bonds were placed on the outside of the rail ball but were too often knocked off by grooved wheels. Rails and splice plates were welded with some success until vibration and truck movement began to break such joints. At one time, in order to use up scrap copper wire a channel pin was placed over each end of an annealed copper wire about 20 in. long. Pin and wire were welded to the base of the rail. Some good joints were made but they were exceptional. Where these bonds were welded to the rail web the rail almost always broke, but these are the only cases of breakage of rails with arc-welded bonds.

For a time the company bonded with No. 2 bare iron wire, using two or three strands. This was cheap and successful on light rails or temporary track. The length

ROCKY MOUNTAIN COAL MINING INSTITUTE, SALT LAKE CITY, AUG. 27-29, 1923

Front row, left to right: F. W. Whiteside, former secretary-treasurer; W. D. Brennan, vice-president; George B. Pryde, president; Benedict Shubart, secretary-treasurer.

of iron was so small in the circuit that it added very little resistance.

The most successful plan the Union Pacific Company has ever tried is to use a flexible, copper arc-welded bond of sufficient length to span the splice plate attached to the inside of the rail base. On some occasions such as bonding in entries on idle days the welding resistance is connected into the circuit at the entry parting so that a welder need carry only the electrode holder, a short piece of cable to hook the trolley wire, the necessary bonds and welding wire.

"The results we have obtained," said Mr. McKeehan's paper, "are so gratifying that the matter of cost is considered irrelevant and no data has been kept."

A line in the paper to the effect that modern practice does not require bonding both rails brought objections in the succeeding discussion. Benedict Shubart, Mr. Rank and J. S. Veatch all declared both rails should be bonded. H. I. Smith said he thought bonds should be on the outside, not inside, of heavy rails because even badly grooved wheels cannot reach them. Bonds are more easily inspected when they are outside, away from piles of dirt and ballast.

A. C. Watts asked how far apart crossbonds should be spaced. George Murphy said bonding both rails with a 22-in. weld and with crossbonds every 100 ft. had reduced his locomotive repair bill 50 per cent. President Pryde said Mr. McKeehan favors crossbonding every 200 ft. Mr. Brewster favored spacing between 200 and 300 ft.

It was suggested that the rail ball is a bad place for bonds because of the danger of breakage, but that bell welds are far cheaper because they take less copper, and also that they are always easier to inspect.

Harking back to Mr. McKeehan's reference to bonding with iron wire Mr. Rank said iron's resistance is ten to fourteen times that of copper, so many men using it lay the old cables along the track so that they may help rails maintain the circuit. F. C. Miller remarked that iron oxidizes too quickly at the point of contact where electrolysis is highest.

William Littlejohn, general superintendent of the Utah division of the Utah Fuel Co., suggested that something ought to be done to correct the failure of employers and employees to work heartily together for safety. Rules are too carelessly made and entirely too carelessly carried out.

P. F. Patterson and G. A. Knox both signed a safety letter to the Institute contending for closer supervision at the mine faces, where at least 60 per cent of accidents occur from falls of roof and coal. Roadways should have

30 in. clearance and rooms at least 24 in. between rib or timber and the track, they believe. Props should be put under loose roof regardless of whether any established system calls for it. Stronger gloves and shoes on miners would prevent many hand and foot injuries. Fiber or metal helmets were advocated to reduce head injuries. Temporary cloth or rubber covering for trolley wires near repair jobs was another safety suggestion.

A long list of safety suggestions were made in the report of Dan Harrington, of the U. S. Bureau of Mines, and James Dalrymple, Colorado's chief mine inspector. Mr. Dalrymple was not present. They survey the chief causes of explosions and suggest that all ventilation systems have auxiliary power, that fans should run 24 hours a day, that every good-sized mine should have more than one air split, each able to deliver enough air to remove all methane as fast as it is liberated, and that ventilation should be under an up-to-the-minute active young man well educated in safety matters.

One per cent or more of methane in the air makes dust more explosive, they said, and the finer the dust the more dangerous it is, especially that finer than 20-mesh. Formation of dust can be reduced by using longwall mining exclusively and by using more holes and less powder in shooting, and the hazard is greatly reduced by washing down sides and roof as well as floor. Rock dusting often is preferable where water is short. Such dust should be used to keep down the percentage of combustible matter in roadway dust to 40 or less. Mr. Harrington and Mr. Dalrymple also favor electric safety cap lamps in all mines of whatever character, and the concealing of all underground cables in conduits. Solid shooting is inexcusable in any mine where the pitch is less than 30 deg., for coal can readily be undercut at any angle up to that. They think shotfirers should be required to have a certificate of competency to be reissued after an examination every five years. In their opinion half the explosions are traceable to defective or out-of-date equipment or practice. Coal-mine superintendents, foremen and firebosses should be required to pass a safety examination at least one in five years.

F. C. Miller, of the Colorado Fuel & Iron Co., read a paper tracing the history of briquetting and reported the progress that has been made in low-temperature distillation of coal. The mention of Henry Ford's interest in coal distillation roused a lively discussion, some of which will appear in a later issue of *Coal Age*.

Commission Publishes Cost of Anthracite To Dealers in Nine States

The U. S. Coal Commission published Aug. 29 figures showing the cost of stove anthracite at the mines and the freight to town, as reported by the dealers in New York, New Jersey, Michigan, Delaware, Maryland, Washington, D. C., Pennsylvania, Wisconsin, Indiana and Ohio. Some time ago these figures were given out for New England.

The commission makes this note with respect to these figures: "In using this cost-to-dealer information, allowance must be made on the one hand for the dealer's losses by degradation and his cost items and a fair margin of profit, and on the other for the 240 lb. difference in the ton used (the long ton). The allowance for the 240 lb. difference is necessary because New York dealers buy at the mines on the basis of gross tons (2,240 lb.) and sell at retail on the basis of the net ton (2,000 lb.)."

It is particularly notable that most of the quotations given by the dealers for stove coal are Company prices—from \$8 to \$8.30. In fact of the 1,791 quotations in these states, 1,288, or 72 per cent, were Company prices, and the remainder, or 513, were \$9 or above.

The Commission announced some time ago that it would not attempt to show consumers in every town the retail price of their coal and the margins and profits made by the dealers, proceeding on the theory that if the townspeople know what the coal costs their retail dealers, and the individual knows what he has to pay the dealer for that coal, the public can make up its own mind as to whether the local dealer is doing the business on a reasonable margin or is exacting an undue profit.

Railroads Consume Less Coal in June

Class I railroads of the United States consumed 8,296,000 net tons of coal during June, 1923, as charged to account 394, compared with 9,034,000 tons during the preceding month and 6,804,000 tons in June, 1922, according to a recent report of the Bureau of Statistics of the Interstate Commerce Commission covering 177 steam roads. During

the first six months of 1923 these roads consumed 56,882,000 tons as compared with 45,123,000 tons during the corresponding period of 1922. The delivered cost per ton in June last was \$3.42 compared with \$3.83 for the corresponding month of last year.

Consumption of fuel oil during June totaled 151,732,000 gallons compared with 147,694,000 gallons in May, 155,062,000 and 119,598,000 gallons in June, 1922. The totals for the first six months of 1923 and 1922 were 896,625,000 and 713,097,000 gallons respectively.

190 Coal-Mine Fatalities in July

Fatal accidents to employees at coal mines in the United States during July, 1923, numbered 190, according to reports received from state mine inspectors by the U. S. Bureau of Mines. The fatality rate was 3.55 per million tons, based upon 53,446,000 tons of coal produced during the month, as compared with a rate of 3.18 in the previous month and of 5.27 for July last year. For bituminous mines alone the July rate was 3.28 as against 4.96 for the same month a year ago. For anthracite mines alone the July rate was 5.05 per million tons; there is no corresponding figure for July last year because the mines were closed on account of the miners' suspension of work. The average fatality rate for July during the past ten years is 3.82 per million tons for bituminous mines, 6.41 for anthracite mines, and 4.22 for the entire coal-mining industry. It will thus be seen that the accident rates for July, 1923, were lower than those for July last year and also lower than the ten-year average rates for the same month.

The record for 1923 to the end of July shows 1,424 fatalities indicating a rate of 3.77 per million tons, as compared with 4.21 per million tons for the corresponding months last year. The bituminous rate for seven months of 1923 is 3.49 as against 3.92 for the same period last year; the seven-months anthracite rate is 5.28, as against 6.75. The accident record for 1923 to date shows a reduction of 11 per cent in the fatality rate for bituminous mines, 22 per cent for anthracite mines, and 10 per cent for all mines combined.

COAL-MINE FATALITIES DURING JULY, 1923, BY CAUSES AND STATES

Salient Points in Governor Pinchot's Proposal to End Wage Controversy

Upon the basis of the information assembled, with the profound belief that it affords a basis of settlement which is reasonable and just, which miners and operators alike may accept with credit and honor, and with the firm conviction that fairness to the anthracite-using people of America requires that it shall be accepted, I recommend the following basis of settlement, with the understanding that all questions concerning it or not covered by it shall be referred to the Joint Conference of Scale Committees, and that the Anthracite Conciliation Board shall determine any questions upon which the Joint Conference cannot agree:

(1)—Recognition of the basic eight-hour day for all

employees. If longer hours are necessary at certain times, or in certain occupations, the overtime to be paid for at the eight-hour rate.

(2)—A uniform increase of 10 per cent to all employees, this increase to take effect Sept. 1.

(3)—Full recognition of the union by the operators, without the check-off, but with the right to have a union representative present when the men are paid. I do not regard the question of the open or closed shop as an issue in this controversy.

(4)—Complete recognition of the principle of collective bargaining.

Anthracite Mine Workers Walk Out September 1; Pinchot Hopeful of Early Settlement

Although Governor Pinchot was not successful in averting the anthracite strike, which started at midnight Aug. 31, his peace plans have not yet been utterly rejected and he again renewed his efforts to bring about a settlement on Wednesday afternoon at 2 o'clock, when the conferees resumed their parleys at Harrisburg. All of the mine workers are out except the maintenance men, numbering between three and four thousand.

The conference started Aug. 27, when the Governor presented his reasons for prompt action, suggesting separate meetings with the operators and with the miners, a plan that was readily agreed to. The miners met with him Monday afternoon, Aug. 27, and the following day he met the operators and then held conferences later with the miners and the operators, concluding two meetings with each within a day after calling the general conference.

On Wednesday the Governor presented his peace proposal, consisting of four points and several supplemental matters, these latter including his modified plan of arbitration for the settling of disputes before the Anthracite Conciliation Board—a fifth point, really, that has concerned the miners greatly during the conference. The four points were recognition of the basic eight-hour day for all employees, a uniform increase of 10 per cent in wages, full recognition of the union by the operators without the check-off and complete recognition of the principles of collective bargaining.

OPERATORS SEEK FOUR-YEAR AGREEMENT

The two sides to the controversy gave their answers to the Governor on Friday, Aug. 31, Thursday having been devoted to a study of the Governor's recommendations. The operators accepted three of the four points, and on the fourth, that of an increase in wages, said that while they were opposed to any increase at this time, if there is to be an "uneconomic wage" the new contract should cover a four-year term. The miners accepted the eight-hour day proposal and that relating to collective bargaining, but contended that while the wage increase proposed is a "step in the right direction" it does not adequately provide for the day workers. They rejected the check-off arrangement of the Governor, which would permit a union collector at the pay window on pay days.

The operators and miners met in joint conference at the Capitol on Friday and remained with the Governor for five hours. The Governor separated the two sides soon after they reconvened and acted as intermediary during the long discussion, once calling them together when he believed he could convince them that a settlement could be effected. At this joint meeting John L. Lewis, president of the United Mine Workers, and Samuel D. Warriner, spokesman for the operators, spoke. It is said that the Governor at that time suggested that he act as arbitrator, but that the operators bluntly told him that he was not

sufficiently qualified in mining matters to assume such a position. Again on Saturday there was a joint session and this lasted but 35 minutes. It was then agreed to take a recess until Wednesday, Sept. 5.

At the conclusion of the meeting on Saturday, Sept. 1, Governor Pinchot said he felt encouraged but he would not say upon what he based this feeling. Neither operators nor miners would discuss the situation in any way. The Governor issued the following statement in which he stressed the public's side of the matter and pointed out that a winter with little anthracite in Pennsylvania means many additional deaths. Here is the statement:

"The essential and encouraging fact is that the negotiations, which yesterday were lagging, are still going on. Both committees have suggested an adjournment for the purpose of more carefully considering the whole situation, including the four points of my recommendations. But since each committee will do so from the point of view of the interests of its own side, this seems to me like a good time for the people to consider their own interests also and to make their will known through the fullest public discussion.

"In these negotiations I have been representing the public and its necessity to get coal. To get coal we must find a common ground upon which miners and operators may meet and settle their differences with some regard for the public right. That common ground, in my opinion, properly covers a wage increase and a slight temporary rise in the price of coal. The choice lies between that and the threatened shortage.

"The public is the most numerous and the most important party to this controversy. Its rights are paramount. Its welfare is the first consideration. The health and welfare of the people are directly and most seriously threatened by the closing down of the mines. . . .

"Both committees have agreed to meet me again in Harrisburg on Wednesday, Sept. 5, at 2 p.m. I welcome this breathing space for the hard-pressed leaders on both sides, and I urge them to use it in acquiring a realizing sense of the public point of view. This is not a private quarrel. Neither miners nor operators have any right to disregard or overlook the public suffering which would follow a prolonged strike. The patience of the people is very near its end. We have seen it pushed beyond endurance before, and we have seen the results."

The Governor's presentation on Aug. 29 of his idea of a way to avert the strike was, like his statement read at the opening of the parley, Aug. 27, clear and to the point, and both sides seemed gratified with the way in which he had handled a knotty problem, if not satisfied with his conclusions.

The 10 per cent increase in wages, one half of what the miners asked, would mean, he said, 60c. per ton additional

to the cost of domestic sizes at the mine. Ten cents of this should be absorbed, he suggested, by the operators and the remaining 50c. eventually should be taken out of the cost of transportation and distribution.

The statement follows in part:

'My justification for proposing a basis upon which I believe this strike can be prevented with justice to all parties is threefold:

"First, that this controversy has continued until all chance of agreement by direct negotiations between the miners and operators has been lost."

"Second, that the interest of the miners, the operators and the public all require that this controversy shall be settled without a strike.

"Third, that the public is entitled to a voice in the discussion and the rights of the people generally deserve consideration at least as much as those of the miners and the operators.

"Under such circumstances, and in a case where the public welfare so urgently requires protection, the people have the clear and unquestionable right to demand a settlement.

"I suggest as a means of avoiding or settling differences that if in the course of collective bargaining the scale committees of the miners and operators are unable to agree they shall select a man agreeable to both sides to attend and take part in their discussions, but without a vote, and not as umpire or referee. If they are still unable to agree, their differences shall be referred to the Conciliation Board, which shall be provided with whatever equipment is necessary for the rendering of prompt decisions.

"I am strongly of opinion that an agreement signed on the foregoing basis should cover not less than one year.

"The whole body of wage rates in the anthracite field is antiquated, haphazard and honeycombed with inequality. It needs revision. I suggest that the Anthracite Conciliation Board be authorized by the Joint Wage Scale Committees to undertake and complete within a year a thorough revision, and for that purpose be supplied with the necessary help.

"The proposed increase of 10 per cent is recommended in view of the high degree of skill required among the miners and the extra hazardous nature of the occupation. Five hundred workers are killed and 20,000 are injured each year.

WAGE INCREASE TO RAISE COST 60c. PER TON

"The 10 per cent wage increase, according to the best figures available to me, will add 60c. a ton to the cost of domestic sizes of anthracite coal at the mine. Of this amount not less than 10c. can be and ought to be absorbed by the operators without any increase of price. In the last three months of 1922 and the first three months of 1923 their profits have been greater than ever before in their history. But the extent to which these producing conditions will continue no one can now predict with confidence.

"The remaining 50c. per ton should not in the end be taken from the consumer. The whole of it can easily and properly be taken out of the cost of transportation and distribution.

"Anthracite mines vary in the cost of producing coal. A very considerable percentage of the mines could bear at least half of the probable increase of 60c. per ton and still run at a fair profit. Others, operating on a smaller margin, might be forced to close down if their cost of production were raised even by a much smaller amount. To decrease the margins at the mines more than 10c. per ton now might unduly reduce production. It is to the public interest that bins be filled for the winter and that factories continue to operate. When production is assured I intend to recommend construction plans that will, I am confident, prevent any part of this increase of 50c. a ton going to the consumer.

"I believe the proposed settlement to be fair to all three parties to this controversy. It is fair to the miners, for it will notably improve their condition as to wages, hours and recognition of the union. It is fair to the operators, for it leaves them in position to continue running their mines, and to do so at a reasonable profit. It is fair to the

public, for the public can better afford to get anthracite at a slight increase in price, if that cannot be avoided, than not get anthracite at all. In particular, it leaves both miners and operators far better off than either would be if the contention of the other had been accepted.

"I call the attention pointedly of both sides to the fact that neither miners nor operators, whether the strike goes on or whether it does not, can hope to have their own way fully in the end. Whether now or later, a compromise is inevitable. It is immensely to the advantage of each of the three parties in interest that the compromise shall be made before the enormous loss and suffering of a strike is undergone, rather than afterward."

The general policies committee of the anthracite operators held a long session in Philadelphia Aug. 30 considering Governor Pinchot's proposal for settlement of the wage controversy and reached a decision, to be presented to the Governor at Harrisburg Friday. In keeping with the suggestion of the Governor that he be first informed of the response to be made by both miners and operators, the coal company representatives withheld all information on the subject.

Virtually the entire anthracite industry was represented at the meeting, which was held in the office of the Lehigh Coal & Navigation Co., of which Mr. Warriner is president. Besides Mr. Warriner, among those who attended the meeting were: W. J. Richards, Philadelphia; W. W. Inglis, Scranton, and A. B. Jessup, Hazleton, of the subcommittee which is directly negotiating with the miners; J. M. Humphrey, Wilkes-Barre; W. L. Allen, Scranton; A. C. Dodson, Bethlehem, Pa.; Percy C. Madeira, Philadelphia; E. H. Suender, Frickville, Pa.; A. M. Fine, Scranton; A. Morris, Scranton; S. B. Thorne, New York; J. F. Birmingham, New York; J. B. Warriner, Lansford, Pa.; Thomas Dickson, New York, and C. D. Goldsborough, New York.

Reports Differ on Who Beat Pascoe

In a communication to the U. S. Coal Commission Aug. 29 Ellis Searles, John Moore and Thomas Kennedy, representing the miners' union, charge that Samuel Pascoe, of Ashland, Ky., president of District 30, on Aug. 3, was attacked and badly beaten "by hired emissaries of coal companies." Pascoe is head of a district taking in the northeastern Kentucky field, and on Aug. 3 was in Paintsville, "on business," when he received a beating which appears to have been the result of a quarrel.

The committee which is acting in the matter for the union, according to information received from Washington, alleges that the attack on Pascoe is but one of many instances of intimidation employed against union miners in the non-union fields of West Virginia, eastern Kentucky, Alabama and Colorado.

A report of the affair from Paintsville, Ky., differed considerably from the union story from Washington. The Paintsville report stated that Pascoe was not attacked by "hired emissaries" of any coal company, as far as the authorities know. According to the police who investigated the affair, witnesses and others familiar with the circumstances, Pascoe was the loser in a fistic encounter with Link Castle, of Paintsville, in a restaurant. The fight resulted from a quarrel, the nature of which seems not to be known to others. Castle's friends say he is in no way connected with any coal company.

THE ANNUAL CONVENTION of the New York State Coal Merchants Association, to be held at Sacandaga, Sept. 10, 11 and 12, will be addressed by W. H. Williams, vice-president, Hudson Coal Co.; Alan C. Dodson, president, Weston Dodson & Co., Bethlehem, Pa.; Franklin Bache, Philadelphia; G. H. Ingalls, vice-president, New York Central Lines, New York; Walter Gordon Merritt, general counsel, Anthracite Operators Committee, New York, and the following officers of the National Retail Coal Merchants Association: Samuel B. Crowell, president, Philadelphia; Roderick Stephens, former president, New York; R. J. Wulff, treasurer, Brooklyn, and Joseph E. O'Toole, resident vice-president, of Washington.

Operators and Miners Reply to Governor Pinchot

The operators' reply to Governor Pinchot's proposal for settlement of the controversy that has resulted in a strike of anthracite miners was as follows:

"With respect to your proposal No. 1:

"Recognition of the basic eight-hour day for all employees. If longer hours are necessary at certain times, or in certain occupations, the overtime to be paid for at the eight-hour rate."

"We agree to this proposal. It will add some \$2,250,000 to the annual wage bill of the industry, or 5c. per ton to the cost of the domestic sizes."

"With respect to your proposal No. 2:

"A uniform increase of 10 per cent to all employees. This increase to take effect Sept. 1."

"This would add about \$30,000,000 to the wage bill. We are still firmly of the opinion that no general increase in the wages of anthracite mine workers at this time is justified and are supported in this belief by the findings of the U. S. Coal Commission, as follows:

"The earnings of full-time workers certainly permit the essentials of a reasonable standard of living. Those who take full advantage of their opportunities to earn in the various occupations connected with the industry, and are not handicapped by serious misfortune, need not suffer for shelter, food, clothing or other decencies and comforts of life, even without supplementary earnings of wife and children."

"Since you justify your proposed increase as a recompense for skill and hazard, we invite your attention to the fact that these factors have no application to a large part of the workers. As to those to whom they do apply, they have been stressed and considered in every negotiation and arbitration in the last twenty years and already find expression in the wage structure."

"The present wages were fixed by the award of the Wilson Arbitration Commission in 1920, when they were increased 17 per cent in recognition of the high cost of living then prevailing. In spite of the decreased cost of living and decreased wage rates in other industries, the anthracite wages have been maintained at this peak. These rates afford earnings over 150 per cent above prewar earnings, as compared with an increased cost of living of about 62 per cent."

"Considering the foregoing, any favorable consideration by us of your proposal for a 10-per cent increase must be conditioned upon a durable agreement covering a period of years, with provision for the annual revision of wages on a sound economic basis. If the parties cannot agree upon the revision such determination of wages shall be referred to such a commission as may be specified in the agreement, no suspension to take place pending such determination."

OPERATORS SAY PRICE INCREASE WOULD BE 75c.

"You recognized that your proposed increase in wages will add 60c. per ton to the cost of domestic coal. We estimate it would be a minimum of 75c., excluding the pea size. You acknowledge that most of this increase must be added to the price of coal at the mines. The amount of the increased price to the ultimate consumer will be determined by the ordinary course of economic laws, as statute laws forbid the operators or dealers from entering into any agreement as to prices."

"You state that of an estimated increase production cost of 60c. per ton, 50c. 'can easily and properly be taken out of the cost of transportation and distribution.' The cost of transportation can only be reduced through the unpredictable action of the Interstate Commerce Commission; the cost of distribution can only be reduced through voluntary action of distributors. We do not see how such reduction can be assured by any private person or public official and until these reductions are assured the public will have to pay the cost of increased wages."

"With respect of your proposal No. 3: 'Full recognition of the union by the operators without the check-off, but with the right to have a union representative present when the

men are paid. I do not regard the question of the open or closed shop as at issue in this controversy.' This proposal, as we understand it, involves merely a continuance of existing practices, to which we assent."

"There is already full recognition of the United Mine Workers of America, as evidenced by the existing agreement between us. From your statement that you 'do not regard the question of the open or closed shop as at issue,' we assume that you have no intention of suggesting that the award of the Roosevelt Coal Commission of 1902, bearing upon this matter, should in any wise be changed. That award provides:

"That no person shall be refused employment, or in any way discriminated against, on account of membership or non-membership in any labor organization; and that there shall be no discrimination against or interference with any employee who is not a member of any labor organization by members of such organization."

"In reply to your suggestion that the union have 'the right to have a union representative present when the men are paid,' we beg to state that this is an existing practice and there is no objection to continuing the provision of the existing contract in this respect."

"With respect to your proposal No. 4: 'Complete recognition of the principle of collective bargaining.'"

"Complete collective bargaining, as we understand it, now exists throughout the industry whereby agreements are made periodically with the union. These agreements cover wages and working conditions and further provide that all differences arising during the term of the agreement not otherwise adjusted shall be settled by the Board of Conciliation and Umpire. We agree that this practice of collective bargaining shall continue."

"In making this response to your proposals we do so upon the understanding that the other demands of the miners presented at the Atlantic City conferences, not heretofore agreed upon, shall be deemed abandoned."

"In closing, permit us to repeat the thought that the public is now entitled to a complete and durable settlement. If at this time it is to be asked, even temporarily, to bear the burden of an uneconomic wage, it must be safeguarded against an early recurrence of this unfortunate situation, and must be assured that the principle of orderly adjudication is now receiving some recognition."

MINERS' RESPONSE TO PINCHOT PROPOSAL

The miners' replied to Governor Pinchot's proposed plan of settlement in relation to wages is as follows:

"The principle of the eight-hour work day as applying to all employees in the anthracite industry has already been agreed upon by the operators and miners in joint conference. The details of the hourly and daily rates affected by this change have also been worked out as affecting the maintenance men, and it may be logically assumed that similar satisfaction may be achieved in the adjustment of the rates of all other men affected."

"Your suggestion for an increase of 10 per cent as affecting the contract miners is a step in the right direction, although not compensatory for the distinct service rendered by such men and being insufficient to meet their needs. We also desire to call your attention to the fact that 65 per cent of the men employed in the anthracite industry are paid by the day, and the application of a percentage increase to the multiplicity of rates in this classification is wholly unsatisfactory for two substantial reasons:

"A percentage increase would widen the existing differentials between the various classifications of labor and thus accentuate the existing inequalities in rates, which constitute a source of bitter complaint among the men affected."

"A percentage increase also has the effect of giving to the lowest paid worker a lesser increase in actual wages than is given to those who enjoy a higher rate."

"Experience has taught the necessity of translating percentage increase into an equivalent number of cents per day for application to the rates of those who are thus

employed. The representatives of the mine workers therefore desire to impress you with the importance of this matter."

MINERS' REPLY IN REGARD TO CHECK-OFF

The text of the miners' response on the check-off follows:

"The mine workers regret your refusal to incorporate the check-off arrangement in your recommendations. The fact that your refusal is not amplified by any explanation leads us to assume that you did not, perhaps, have full information available on this subject. We desire consideration of the check-off for two reasons, viz.: as a matter of convenience and economy in the maintenance of the organization and the administration of its affairs; to give greater stability to the joint wage agreement and to insure the punctilious observance of all contractual obligations in harmony with the recommendations of the U. S. Coal Commission. Such a provision in the agreement would not in any manner add to the cost of the anthracite commodity. No valid objection can be made to the check-off unless one persuades himself to believe that the extension of a courtesy constituting a convenience to the United Mine Workers of America can be construed as a reprehensible act.

"The mine workers' representatives do not request that the check-off apply to any individual other than those who file a voluntary written order, constituting a legal assignment, for the exercise of the privilege.

"We call your attention to the fact in the bituminous mining fields of central and western Pennsylvania, that approximately 100,000 mine workers enjoy this privilege through their wage agreements with the bituminous operators. For a quarter of a century this arrangement has existed in the bituminous districts where collective bargaining is recognized and the anthracite mine workers are only requesting that equal recognition be accorded them as is given by other coal operators.

"May we not point out that important producers of anthracite having operations in the bituminous districts freely admit the virtue and permit the existence of the check-off arrangement in their soft-coal mines while issuing fulminations against it in the anthracite territory? This is particularly true as affecting the Susquehanna Collieries Co., the Madeira-Hill interests, the Glen Alden Coal Co. and others, the Delaware & Hudson and others.

"The Delaware & Hudson Railroad Co., which is one of the most important of the railroads producing anthracite, has organized its own company union among its shop employees. Membership in the company union is compulsory upon those accepting employment and the monthly membership dues are deducted from the employees' pay envelopes. Paradoxical as it may seem, the representatives of the Delaware & Hudson Railroad Co. are among the most virulent in their opposition to the mine workers' request for a check-off arrangement. They pursue a 'Dr. Jekyll and Mr. Hyde' labor policy in this respect, which engenders unrest and breeds discontent.

"It is also true that practically all of the railroad systems of the country who are still resisting the shopmen's legitimate trade unions have organized company labor unions among their shop employees. These unions are organized and conducted solely in the interests of the railroad companies, and membership in them is made compulsory, and through the instrumentality of the check-off the railroad companies collect the monthly dues.

"It will thus be recognized that the corporate foes of the United Mine Workers of America do not hesitate to utilize the check-off arrangement when it serves their particular ends, while at the same time they fulminate against the mine workers' request for consideration upon this point.

"As representatives of the United Mine Workers of America we feel that in the absence of any reasonable or valid objection to the check-off by the anthracite operators we are entitled to recognition on this point.

"We understand that your fourth recommendation, affecting the principle of collective bargaining, means that the anthracite operators would forego their practice of contracting with individual employees for service at less than

the prescribed rates. We further understand that it means that the workers have an inherent right to exercise their voice and judgment, through representatives of their own choosing, upon matters affecting wages, hours of labor and conditions of employment. With this recommendation we find ourselves in entire accord.

"In consideration of these several matters, including the remaining number of eleven demands of the United Mine Workers, we feel that your action has paved the way to a reopening of joint wage negotiations between the anthracite operators and the representatives of the mine workers. Such a conference could take your wage suggestions for contract miners as a basis, and by diligent application could probably make substantial progress in working out a new agreement. We accordingly advise Your Excellency that the representatives of the mine workers will hold themselves in readiness to enter such joint conference at any time such a meeting can be arranged.

"We note your further suggestion that in the process of collective bargaining both sides should select an individual to attend meetings and take part in discussions without a vote, and that in the event of failure to agree all differences should be referred to the Anthracite Board of Conciliation, which would result in ultimate decision by the Umpire attached thereto.

"Whether or not it was so intended, the language of your suggestion would imply that the mine workers should accept for the future permanent arbitration of the major provisions of wage agreements. We believe that such an expression is in conflict with the principle enunciated in your fourth recommendation, which grants the complete recognition of collective bargaining. We scarcely feel that it is necessary, in any detailed form, to analyze our publicly recognized opposition to arbitration of the basic principles of wages, hours, working conditions and human relationship in the anthracite industry. Our position on this matter has been made known to the President of the United States, and from time to time has been restated to governmental agencies, including the U. S. Coal Commission. The anthracite operators, upon repeated occasions, have been formally advised of our attitude on this question.

"We find ourselves in harmony with your further suggestion that the Anthracite Board of Conciliation be authorized to undertake and complete a further revision of the whole body of the wage rates in the anthracite region which you so aptly describe. The representatives of the United Mine Workers will diligently co-operate in effectuating a revision which will eliminate the existing inequities."

Tentative Agreement with Maintenance Men

As a safeguard against any serious damage resulting in the event of trouble between the union and the operators, an agreement was signed Aug. 30, by which the maintenance workers, numbering about 3,000, would be exempted from the strike order and permitted to continue at their work of protecting the mines against flood or other damage. By this agreement the men who were working ten to twelve hours a day were put on an eight-hour basis, receiving their old daily wage for eight hours with pro-rata pay for time worked in excess of eight hours.

This means an increase of \$1.10 to \$1.15 a day for 975 of the men who will remain at work, an increase which the operators conceded in the early days of the Atlantic City conferences when they agreed to abandon the twelve-hour day.

Notice that the operators had agreed to the miners' terms for these men was the first intimation to be made public that they were convinced the men would quit work. On receipt of it the scale committee sent out orders to the local unions specifying the number of men who were to remain at work and the class of work they are to do.

SECRETARY DAVIS of the Department of Labor hopes to see the day when there will be no strikes. The consumers of hard coal would be satisfied with a year in which there was no strike of anthracite miners.—*New York Herald.*

51,000,000 Tons of Bituminous Coal in Storage Aug. 1, 44 Days' Supply; 5,000,000 Tons Gain in Month

Soft coal continued to flow into storage during July and on Aug. 1, 1923, commercial consumers had on hand approximately 51,000,000 net tons, according to a survey by the Bureau of the Census and the Geological Survey, under authority of the Federal Fuel Distributor. In comparison with the revised figure for July 1, 1923, this was an increase of 5,000,000 tons. Progress in the building up of stocks from the low point reached on Sept. 1, 1922, owing to drafts on reserves during the strike last summer, has been practically uninterrupted, and in the eleven months that have elapsed there has been a net gain of 29,000,000 tons. Stocks on Aug. 1, 1923, were 10,000,000 tons larger than on Aug. 1, 1921. On the dates for which stock records are available the supply on Aug. 1, 1923, has been exceeded only during the periods at the close of the war and just prior to the miners' strike of 1922.

Measured in terms of tons, stocks increased 10.9 per cent during July; in terms of days' supply, the increase was 18.9 per cent. The larger increase in days' supply was due to the fact that the rate of consumption decreased in July, thereby increasing the length of time the tonnage on hand would last. At the rate of consumption in July the stocks on Aug. 1 were sufficient to last 44 days on the average, assuming that stocks were evenly divided.

Total stocks on the Lake docks at Duluth-Superior, Ashland-Washburn, and at Lake Michigan ports on Aug. 1, 1923, were about 5,361,000 tons. Compared with the 3,991,000 tons on the docks on July 1, this was an increase of approximately 34 per cent. A group of producers who store coal at the mines or at some intermediate point had 672,000 tons in storage on Aug. 1.

Anthracite.—Retail dealers in anthracite received more of that coal than they delivered in July, and their total stocks on Aug. 1 were 4 per cent larger than on July 1. Practically complete reports on the quantity of anthracite on the docks of Lakes Superior and Michigan indicate that the total on hand on Aug. 1 was 609,000 net tons, against 448,000 tons on July 1.

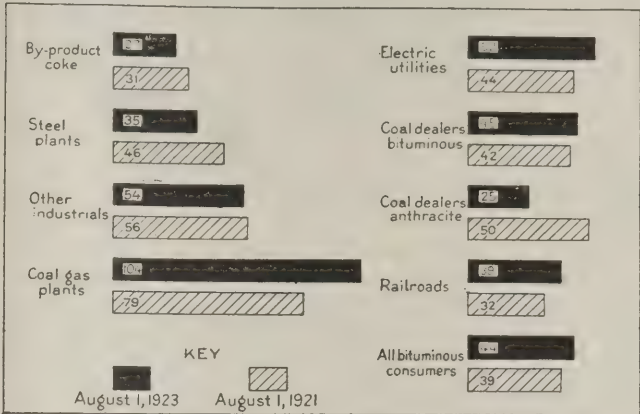

FIG. 2.—DAYS' SUPPLY HELD BY DIFFERENT CLASSES OF CONSUMERS ON AUG. 1, 1923, AND AUG. 1, 1921

At the rate soft coal was burned during July, 1923, the total stocks on Aug. 1 were sufficient to last 44 days, an increase of 7 days over the supply on July 1. The stocks on Aug. 1, 1921, were sufficient to last 39 days at the low rate of consumption then prevailing. An important factor in the increase in days' supply on Aug. 1 was an appreciable decline in the rate of consumption in July.

The total quantity of soft coal in the hands of commercial consumers on Aug. 1, 1923, was between 49,000,000 and 53,000,000 net tons—probably 51,000,000 tons. This estimate does not take into consideration coal in the cellars of householders, concerning which no statistics are available, nor steamship fuel, nor coal on the Lake docks, which item is classed as coal in transit.

Fig. 1 shows that reserves were added to more rapidly during July than in any other month during the present period of accumulation. Stocks have been built up to the point where they exceed by a large margin those on any preceding summer date, and in fact they compare favorably with those on any date for which records exist. The quantity in storage piles on Aug. 1, 1923, was 25 per cent larger than on Aug. 1, 1921; 5 per cent larger than on Nov. 1, 1921, and but 12 per cent behind Jan. 1, 1919, when exceptionally large supplies were on hand.

Estimates based on the reports from consumers and supplemented by other available information indicate that the total quantity consumed in July, including exports, was in the neighborhood of 42,000,000 tons, or at the rate of about 9,250,000 tons per 7-day week.

Consumers' Stocks in Terms of Days' Supply.—Fig. 2, which is based upon the data in the table below, offers a comparison of the days' supply held by the seven principal classes of consumers on Aug. 1, 1923, with that on Aug. 1, 1921. In using that date for comparative purposes it should be carefully noted that in actual tonnage stocks were less than now, but owing to the low rate of consumption in the summer of 1921, due to the severe industrial depression, the days' supply for certain types of consumers was larger. The average stocks on Aug. 1 were sufficient to last 44 days at the rate of consumption in July, whereas those on Aug. 1, 1921, were sufficient to last 39 days at the rate of consumption from Aug. 1 to Nov. 1 of that dull year.

FIG. 1.—TOTAL COMMERCIAL STOCKS OF BITUMINOUS COAL, OCT. 1, 1916, TO AUG. 1, 1923

Figures represent million net tons and include coal in the hands of railroads, industrial consumers, public utilities, and retail dealers. Coal for steamship fuel, Lake docks, in transit, and in the bins of householders is not included. The figures for 1923 are subject to revision.

DAYS' SUPPLY OF BITUMINOUS COAL IN HANDS OF VARIOUS CLASSES OF CONSUMERS, JAN. 1, 1919, TO AUG. 1, 1923 (a)

(a) The figures in this table are estimates based on incomplete data.
(b) The rate of consumption used in calculating the days' supply on Aug. 1, 1923, was the quantity consumed in July.
(c) Subject to revision.

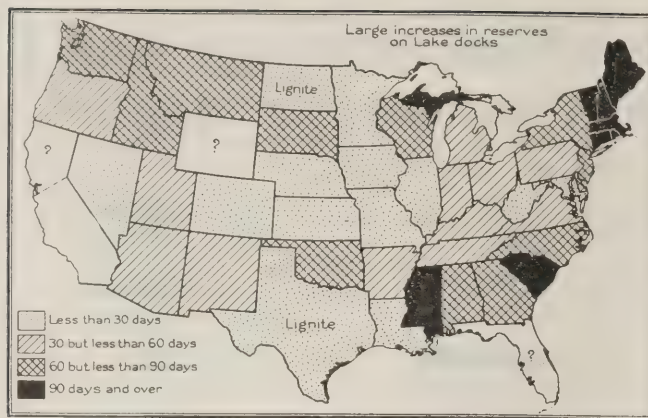

FIG. 3.—DAYS' SUPPLY OF SOFT COAL ON HAND AT INDUSTRIAL PLANTS ON AUG. 1, 1923

At the average rate of consumption that prevailed during July, 1923, reserve stocks at industrial plants other than steel and byproduct coke would last on the average 54 days. The map shows how the supply varied from state to state. Changes in business activity which affected coal consumption are quickly reflected in the days' supply. Based on reports from 2,229 plants.

Stocks, by Localities.—Fig. 3 shows graphically the variation in stocks in each state. The map shows the days' supply held at general industrial establishments, excluding steel and byproduct coke plants.

Over the country as a whole the stocks held by general industrials on Aug. 1 were sufficient to last 54 days on the average, an increase of 8 days over the supply on July 1.

The distribution of stocks as shown by the map does not vary greatly from the customary condition. New England, the most eastern of the Middle Atlantic States, the South Atlantic Coastal Plain, certain of the Gulf States, the Northern Peninsula of Michigan, Wisconsin, and the Northwest were particularly well supplied, and as usual had heavier supplies than the states included in a broad belt through the center of the country from the Atlantic to the Pacific, the lignite-burning states, and those in the upper valley of the Mississippi.

Electric Utilities.—Reports from the electric-utility plants indicated that stocks increased and that the supply on hand on Aug. 1 was sufficient for 52 days, against 48 days' supply on July 1. On Aug. 1, 1921, such plants had enough coal to last 44 days.

Coal-Gas Plants.—The stocks at coal-gas plants increased in July and a new record of stocks at such plants was established, both from the viewpoint of days' supply and tonnage involved. The supply was sufficient to last 104 days, and exceeded stocks on Aug. 1, 1921, by 25 days.

Byproduct Coke and Steel Plants.—Complete returns from the byproduct coke and steel plants showed the following reserves on Aug. 1, 1923, at the rate of consumption in July, and on Aug. 1, 1921:

BYPRODUCT PLANTS

	Days' Supply	
	Aug. 1, 1923	Aug. 1, 1921
Low-volatile....	27	Separation not possible
High-volatile....	27	not possible
Average.....	27	31

STEEL WORKS

	Days' Supply	
	Aug. 1, 1923	Aug. 1, 1921
Steam coal.....	31	36
Gas coal.....	42	61
Average.....	35	46

Railroad Fuel.—Estimates of railroad-fuel stocks, based on reports submitted by the American Railway Association, place the total quantity held by the railroads in stockpiles, cars and chutes, on Aug. 1, at 13,800,000 tons, a supply sufficient for 39 days. In comparison with July 1 this was an increase in days' supply of 39 per cent.

Retail Dealers, Bituminous.—Deliveries of soft coal by retail dealers decreased in July, the average rate being 9 per cent less than that during June. Receipts somewhat exceeded deliveries and on Aug. 1, 1923, retailers had a supply sufficient to last 45 days, against a 39 days' supply on July 1. On Aug. 1, 1921, they had enough for 42 days. The actual tonnage held by retailers on Aug. 1, 1923, was 12 per cent less than on Aug. 1, 1921, and 20 per cent less than on Nov. 1 of that year.

All available information indicates that during July there was a comparatively small decrease in the quantity of bituminous coal in transit, which probably did not exceed 4,000,000 tons.

Coal on Upper Lake Docks.—Practically complete reports show that stocks on the docks of Lakes Superior and Michigan increased from 3,991,000 tons on July 1 to 5,361,000 tons on Aug. 1, 1923. On Aug. 1, 1921, the total was 8,139,000 tons.

Unbilled Loads at Mines.—The quantity of unbilled coal in cars standing at the mines and the tonnage at junction points and terminals changed but little in July, and on Aug. 1 stood at 560,000 and 27,000 tons, respectively.

Bituminous Coal Stored by Producers.—Reports from an incomplete list of producers show that on Aug. 1 672,000 tons of bituminous coal were on hand at the mines or at some intermediate point between the mines and centers of consumption. On July 1 690,000 tons were so held.

Stocks of Coke at Byproduct Coke Plants.—Byproduct coke plants continued to accumulate stocks during July and the total surplus coke on hand on Aug. 1 was 430,000 tons. This was an increase over the supply on July 1 of 122,000 tons, or nearly 40 per cent. In spite of the increase, however, stocks on Aug. 1 were not quite half those on March 1, 1922.

Anthracite.—Although somewhat lessened by the observance of Independence Day as a holiday, the production of anthracite in July was maintained at a level that has been exceeded in the corresponding month but 3 times in the past 10 years. Little, if any, of the sizes suitable for household purposes were burned, and it seems quite probable that practically the entire quantity of such sizes was added to stocks, either by consumers or retail dealers.

Householders' Stocks.—Examination of production figures and stocks held by retailers indicate that householders remember their inability to procure a full supply of anthracite during the past winter and under the stimulus of another possible interruption in the supply this fall, are laying in more than the usual quantity at this season of the year. Although householders' bins had been nearly stripped of anthracite at the end of the past winter, the available production has been taken by them so rapidly, it seems likely that many homes are now well stocked.

Retail Dealers' Stocks.—The stocks of anthracite in retail coal yards on Aug. 1, 1923, though 10 per cent larger than on July 1, were much lower than during the summer of preceding years, largely because of the rapidity with which coal has been taken by the consumers. It has not been possible for the government to make a complete count, but a selected list of 424 dealers from whom reports have been received since 1919 shows total stocks of 827,711 tons on Aug. 1, against 793,841 tons on July 1, 1923. These dealers had 47 per cent less anthracite on hand than on Aug. 1, 1921, and 13 per cent less than on Jan. 1, 1919.

Anthracite in Transit.—According to reports from the dock operators, there were 608,726 net tons of anthracite on the Upper Lake Docks on Aug. 1, 1923, compared with 1,090,258 tons on Aug. 1, 1921; 1,316,070 tons on Nov. 1, 1921, and 447,610 tons on July 1, 1923.

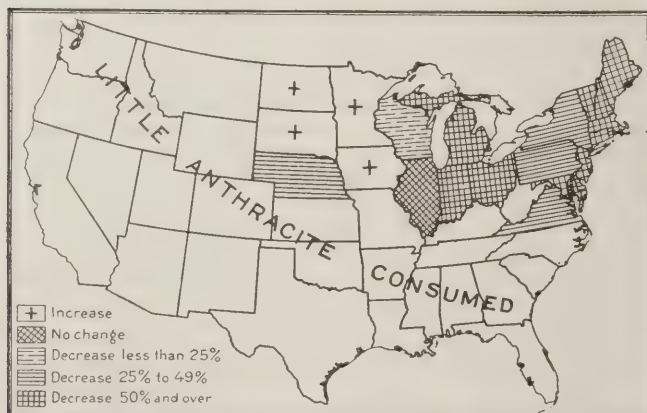

FIG. 4.—HOW RETAILERS' STOCKS OF ANTHRACITE ON AUG. 1, 1923, COMPARED WITH THOSE ON AUG. 1, 1921

Stocks of anthracite in retail yards increased 4 per cent during July. The supply on Aug. 1 was sufficient to last on the average 25 days at the rate of delivery in July. The map shows how stocks on Aug. 1, 1923, compared with those on the corresponding date 2 years ago. Only in a portion of the territory served by the Lake docks did the supply on Aug. 1, 1923, exceed that on the earlier date.

Production and the Market

Weekly Review

Stoppage of work in the hard-coal fields has caused no marked change in the market. Inquiries have increased, but prices in the East have not gained. Up to the last day before the strike began anthracite was produced at a record rate. In the week before the strike the output was the highest recorded this year for both hard and soft coal. There will be no active demand for soft-coal substitutes until cooler weather and if the railroads continue to perform as well as they have for the past eight months there is little likelihood of price inflation.

Production of anthracite to date for the present coal year is estimated at approximately 41,400,000 net tons, 2,824,000 tons more than during the corresponding period of 1921 and 2,380,000 tons more than during the same period of 1920. During the week ended Aug. 25 hard-coal miners produced 2,165,000 net tons, an increase of 207,000 tons over the preceding week.

The government's stock report on Sept. 1, shows 51,000,000 tons of bituminous coal in the hands of consumers as of Aug. 1, a gain in July of 5,000,000 tons. Production of soft coal in July was 45,000,000 tons. Consumption and exports were 40,000,000 tons. Production in August was around 48,500,000 tons, which indicates a further gain of stocks in August of between six and eight million tons, bringing the total on Sept. 1 to around 57,000,000 tons.

PRICE INDEX ADVANCES SLIGHTLY

There was another slight advance in soft coal last week, *Coal Age Index* registering 204 on Sept. 4, a gain of two points, with an average price of \$2.47. Prices throughout the West showed slight increases, while in the East they remained practically unchanged.

In the Chicago market domestic coals are in better demand due in part possibly to the anthracite suspension and on account of recent slow buying, while the busiest market marked by the heaviest buying since the first of the year, due to a few days of cool weather,

is reported in the steam-coal market. In New England buyers showed no interest, practically all industries having heavy reserves.

The market for substitutes gained strength during the week, particularly coke. Inquiries were more numerous and considerable business was reported as having been placed. Prices were stronger. While some producers of bituminous screened coals reported active business and claimed to be sold up at present, others asserted that while inquiries were numerous actual business was slow.

Lake shipments of bituminous coal continues at about 1,000,000 net tons weekly. Congestion at the upper lake

LAKE COAL DUMPED

Fuel	59,024	918,852
Totals	986,406	18,801,401

ports continues. Shipments of anthracite from Buffalo during the present season to Aug. 28 amount to 1,903,170 net tons, as compared with 2,637,463 tons in the corresponding period of 1922.

The export demand is quiet, although it is expected that increased buying will soon follow as the result of the Italo-Greek trouble.

a) Subject to revision. (b) Revised from last report.

Demand Increases Slightly in Chicago

The suspension of operations of anthracite mines caused only a slight increase of demand in the Chicago market. Domestic sizes of coal are somewhat in greater demand, possibly due to the anthracite mines not operating or on account of slow buying during the past few months. The little excitement that prevails is more on the part of the wholesale companies. There is a noticeable demand for coke, which is selling at \$10.75 per ton f.o.b. ovens in Chicago, which is readily supplied.

The busiest market marked by heaviest buying since the first of the year is the situation as regards bituminous coal in Chicago and the surrounding district last week. A few days of low temperature brought realization that winter is approaching and made all interests, domestic and industrial, look to their coal supply. The promptitude with which the market absorbed all offerings practically eliminated bargain coal and prices from all fields held firmly, with many indications of an upward trend.

A heavy demand for screenings is being experienced by southern Illinois producers. Circular prices are being ad-

hered to rigidly and many concerns report their production as sold for some time to come. There is still maintained a large volume of unbilled lump coal at the mines loaded on cars. Orders and inquiries for domestic sizes are becoming much more frequent, particularly from the country districts and the circular price of \$4.35 is being held strongly, except on the smaller sizes. Central Illinois felt the general improvement in market conditions to that extent that prices advanced from ten to twenty-five cents on the various grades of coal.

In the DuQuoin and Jackson County fields price range from \$3.25 to \$3.50 on domestic lump and egg, domestic nut being offered at \$2.75@3 and screenings at \$1.30@ \$1.40. In the Mt. Olive field demand increased and as a consequence prices have advanced 25c. per ton on domestic sizes. Conditions in the Standard field have improved materially and most operators have advanced their prices over those of the previous week.

Retail Market at St. Louis Improves

An improvement in retail conditions has been noted during the past week in St. Louis. The early demand for

* Net tons, f.o.b. mines.

† Advances over previous week shown in heavy type, declines in italics.

This diagram shows the relative, not the actual, prices on four-teen coals, representative of nearly 90 per cent of the bituminous output of the United States weighted first with respect to the proportions each of slack, prepared and run-of-mine normally shipped, and second, with respect to the tonnage of each normally produced. The average thus obtained was compared with the average for the twelve months ended June, 1914, as 100, after the manner adopted in the report on "Prices of Coal and Coke, 1913, 1918," published by the Geological Survey and the War Industries Board.

anthracite seems to have been taken care of and since the dealers have ample stocks of this grade of fuel on hand, the probability of a strike is not causing consumers any worry. There is a fair demand for coke, but smokeless is not moving in any quantity.

Quotations in western Kentucky have advanced 10c. to 25c. a ton on prepared sizes over the past ten days, but actual sales are not much higher if any than they have been. Operators are very anxious to obtain higher prices and believe that September will bring better levels.

Prices Higher at Louisville

Prices quoted on the Louisville market on both eastern and western Kentucky coal are higher, but there is still plenty of coal to be had at about the old levels. Steam coal shows very little change, except some fluctuation in screenings. Domestic coal is generally in fair movement. The Lake movement is still good, while there has been scattered demand from various sections.

Anthracite has been moving readily at Minneapolis. There is always a pickup in the hard-coal movement at this time, and it has been increased by the suspension. Retail dealers have been receiving as many orders as they could comfortably handle, but apparently there has been no serious alarm. Consumers feel assured that they will

be able to get fuel. The docks have received something like 800,000 tons of hard coal this season, about 300,000 tons more than last year. While this is not a full winter's supply, it is around 70 or 75 per cent of a winter's needs.

The soft-coal situation is steady. Dock Hocking is selling at \$6 and occasionally \$5.75. Youghiogheny is about \$6@\$.25. Screenings are around \$3, all prices being at the dock.

Market Stiffens at Duluth

Possibility of a strike had a stiffening effect upon all markets at Duluth. Bituminous advanced generally over last week's quotations and hard coal is the same as before quoted only because of the fact that dock men have announced their intention of maintaining prices "strike or no strike."

Hard-coal prices follow: Stove, \$12.80; nut, \$12.85; egg, \$12.50; pea, \$11; buckwheat, \$8.50.

It is estimated that there is about 4,000,000 tons of bituminous on the docks at Duluth. Railroads, industrial concerns and manufacturing plants are all placing orders.

Prices of bituminous are as follows: Youghiogheny, lump, \$6.50; run of pile, \$5.50; screenings, \$4.25; Hocking, lump, \$6.25; run of pile, \$5.25; screenings, \$3.75; Splint, lump, \$6.75; run of pile, \$5.75; screenings, \$4.75; Pocahontas, lump, \$10.00; run of pile, \$6.75; screenings, \$6.25; Kentucky, lump, \$8.00; run of pile, \$7.25; screenings, \$4.75. Three docks here have stopped shipping anthracite to points outside of Duluth.

The coal market at Milwaukee is active, as far as the domestic field is concerned, but there is not much doing in industrial circles. Consumers of anthracite and the domestic grades of bituminous coal are inclined to be panicky, in view of the uncertainty of future anthracite mine operations, and dealers are pressed with orders. Up to the present time Milwaukee has received only about 50 per cent of a normal supply of anthracite, and the greater part of this is now in the bins of consumers.

The demand for Kansas, Oklahoma and Missouri coal took a pronounced spurt the last week of August. While no new mines were reported opening, those in operation worked almost full time. Mine tracks have been almost cleared of "no bills." Some operators in the Arkansas field advanced the price of semi-anthracite lump 50c. a ton, to \$7, Sept. 1.

Both operators and dealers in Utah report a gain in business. Buyers from Pacific Coast, Northwest and Midwest points are in Salt Lake City making inquiries for coal. Railroads running through the state are storing coal and local industries are buying again, though not heavily. The increase in the domestic trade is marked.

Dealers throughout the Rocky Mountain region have their yards and bins full and consumers are commencing to put in their winter supply. September prices for bituminous are \$6 for lump and \$5.50 for nut, an increase of 25c. per ton over August prices. Mine run is selling at \$4.25@\$.45, slack \$2.25@\$.25 for Walsen and \$3.25@\$.35 for Trinidad. Semi-anthracite in the egg and nut sizes is quoted at \$7.50, chestnut at \$3. Bee-hive foundry coke is selling at \$9.50 and byproduct at \$9 per ton. Lignite prices are now quoted at \$4, \$3 and \$2.25. Mine-run is selling at \$2.50 and slack at \$1.50.

Ohio Dealers Show Anxiety

Retail dealers in central Ohio showed more anxiety about stocks of domestic coal and householders exhibited some concern about their winter's coal. Contracting for domestic lump is active although sellers are loath to engage fuel for any great length of time in the future, believing that the suspension in the anthracite fields will mean advanced quotations on domestic sizes. The hard-coal situation has not reflected so far on the steam coal conditions. Buyers are playing a waiting game. Reserves are sufficient for from sixty to ninety days, while railroad demands are not as large as formerly.

Quotations stiffened in the Cincinnati market as a result of the anthracite situation. The September circular on the low-volatile coals shows little of a startling nature after all the talk that has been made regarding this coal being

sent to New England to take the place of anthracite. However, brokers are asking an advance of 25 to 50c. over the circular and most of the producers say they have plenty of orders or contracts to take their entire output from Sept. 15 to Oct. 15 at the present rate of production, which is about three days a week in the Pocahontas field.

Demand is showing marked improvement at Cleveland. The anthracite situation has not only stimulated steam buying but domestic as well. While the railroads have not increased the quantity of coal they are taking the proportion of eastern Ohio coal going to them is estimated at between 40 and 50 per cent. Operators and jobbers say inquiries are more numerous.

Pittsburgh Prices Move Upward

The Pittsburgh district coal market moved up an average of about 10c. a ton in the last week. The advance occurred without there being any particular change in either production or demand. Of late there has been a close balance, and apart from the fact of many small mines are closed the operation of the district has been very close to capacity. On this account it does not take much to move the market upward.

In the trade the advance is commonly attributed to the anthracite situation.

Buyers in New England Show No Interest

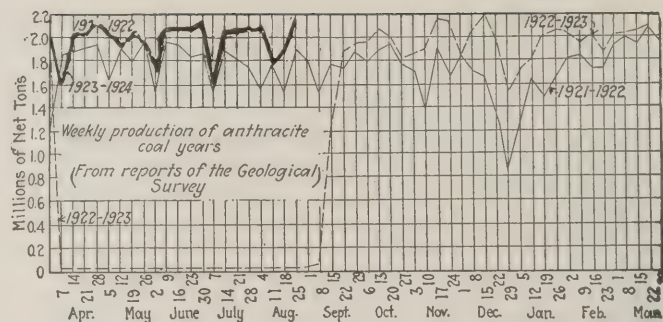

Not even the anthracite controversy in giving the slightest impetus to steam trade in New England. Buyers show no interest whatever and if possible there have been fewer purchases the past week than the week previous. Practically all the industries have coal accumulated for the fall and winter and it would take a very material increase in consumption to justify more than scattering inquiry.

The central Pennsylvania mines are under heavy curtailment, and aside from their tonnage on season contracts there is relatively little coal moving. The railroads are shutting off a percentage of their supply and in no direction is there improvement looked for until well into the autumn. Even miners of the more favorably known grades are pressed to keep in operation and in a few cases where there have been large accumulations at tidewater piers concessions have been made to dispose of the coal.

Prices f.o.b. vessel at Hampton Roads range about the same as a week ago. No. 1 Navy standard grades have been quoted freely at \$5@5.20, and No. 2 coals have been offered down to \$4.80. For inland delivery from points like Providence and Boston the asking price is around \$6.75 per gross ton on cars, although in certain instances sales have been made at as low as \$6.35. At certain of the Hampton Roads terminals there is more coal on wheels than market conditions justify, but at this end there is almost no distress coal, shippers having taken pains to provide alternative disposition before boats were loaded.

In the East the suspension of the hard-coal mines had no material effect on the bituminous-coal situation. There were a few more inquiries, but prices remained on the same level. The market for screened or prepared bituminous coal at New York and Philadelphia is flat, but there is a better inquiry for coke. There is, however, no rush to place orders, although shippers of coke report having received considerable business.

Consumers of soft coal have for the most part anticipated

any possible rush due to a suspension in the hard-coal mines and have taken in heavy supplies. At Baltimore the soft-coal market has failed to react as a result of the hard-coal conditions. With the market spotty keen competition in selling has prevented any change in prices.

Anthracite Suspension Lacks Interest

The stopping of mining in the anthracite regions failed to create any excitement in New York. Many producers stopped taking new orders for coal early last week, pending the outcome of the wage negotiations and some of the smaller independent operators advanced their quotations to meet the demand of some retail dealers, but comparatively little of the high-priced coal found its way into the New York market. Retail yards are comparatively empty of the domestic sizes of coal. Dealers are receiving many inquiries regarding the use of substitutes and some orders have already been placed for either the bituminous screened coals or coke. Similar conditions prevail at Philadelphia. The amount of coal reaching that city during the last week in August would under ordinary conditions be considered large. There is very little hard coal in storage in Baltimore.

Although the retail anthracite market at Toronto is characterized by a steady demand, no great changes have taken place during the past two weeks. The School Finance Committee of Toronto has taken steps to obtain an additional 1,000 tons of coal to prepare for any possible scarcity which might result from a strike. It is expected that a quantity of Welsh coal will be imported by various firms during the coming winter. Prices remain unchanged, anthracite selling at \$15.50, Pennsylvania smokeless at \$6.75, and steam lump at \$6.90.

Coke Market Improves

The Connellsville coke market presented a mixed movement in the past week as to prices. There is a better feeling as to heating coke, on account of the anthracite situation, and a lessened interest on the part of blast furnaces on account of the continued light demand for pig iron and the uncertain prospects in steel.

Heating coke is very strong, ranging from \$4.50 to \$4.65. There has been buying by Eastern dealers, and while the total tonnage taken in the week is very moderate the buying, being coupled in the minds of operators with the anthracite situation, has made the operators very firm.

Spot and prompt furnace coke is quoted firm this week at \$5. September coke, furthermore, has shown a little weakening, since a week ago it was quoted generally at \$5, and one contract, for a particularly good brand, had been made at \$5.15. Now, however, a contract for standard coke for September has gone through at \$4.75.

At New York egg, stove and nut sizes of coke was quoted at \$6.75 to \$8 and run of oven \$4.75 to \$5.25. There was considerable inquiry and some orders placed.

Foreign Market And Export News

Anthracite Suspension Excites Cardiff Market; Foreign Business Slow

The effect of the suspension in the anthracite mines in the United States has been felt at Cardiff, says a newspaper dispatch. The market on Saturday was excited, although no definite orders for coal, as the result of the suspension, had been received. Otherwise, the Welsh coal trade is more or less unsettled, and business on the whole is quiet. Much of this slackness is due to the European exchanges, which means that many of the most regular of the customers in the Welsh markets are forced to hold back contracts on account of the unfavorable state of their currency. Belgium is at present the most active of the Continental buyers, and several orders are coming through. Both business and inquiry with France and Italy is unusually quiet. The German business continues to be fairly low, but a certain amount is coming through Holland, probably on German account. There is no sign of despondency among the Welsh operators, many of whom have sold out their September outputs.

Prices in Newcastle have declined without any corresponding increase in the volume of business. Coal prices are falling and the European business is slow. The one bright spot in the Newcastle market is in the coke sections, especially in gas coke, where inquiries from home and abroad are numerous, and prices are very firm. On the whole the North of England market is stagnant.

Output of coal during the week ended Aug. 18 was 5,124,000 tons, an increase of 1,588,000 tons as compared with the previous week, which was broken by a holiday, and 130,000 tons less than the week ended Aug. 4.

Hampton Roads Market Firmer

The market at Hampton Roads was firmer last week, with dumpings at normal. Coal movement generally showed a slight increase. The trade appeared somewhat uneasy over developments in the coal strike situation.

Domestic dealers were making every effort to stock up against emergency and reported about 40 per cent of the winter's supply of fuel already delivered to consumers, or contracted to be delivered. Export business was holding its own, with coastwise trade slightly better.

The outlook was bright for increased business in the event the miners' difficulties are settled satisfactorily. The trade was optimistic over the winter's business, preparing for increased export trade and making preparations for heavy coastwise movements.

French Output, Imports and Exports

Statistics showing that France produced, exported and imported more coal during the first six months of 1923, than during the corresponding period of 1922 have recently been made public. They follow in metric tons:

COALS			
	1923	1922	
Output.....	18,093,100	15,560,400	
Imports.....	12,353,000	11,335,000	
Exports.....	30,446,100	26,895,400	
	1,198,000	621,000	
	29,248,100	26,274,400	
COKE			
Output.....	882,100	464,300	
Imports.....	1,700,000	1,429,000	
Exports.....	2,582,100	2,893,300	
	190,000	222,000	
	2,392,100	2,671,300	
PATENT-FUEL			
Output.....	1,465,800	1,295,200	
Imports.....	388,000	750,000	
Exports.....	1,853,800	2,045,200	
	135,000	49,000	
	1,718,800	2,605,000	

The production of independent coke-ries, it was pointed out, are not included in the figures showing the amount of coke produced, nor is the production of works independent of collieries included in the figures showing the amount of patent fuel produced.

French Coal Trade Quiet

Business was quiet in France last week on account of the Assumption holiday, however, there was better demand; the retailers wishing to replenish their stocks before winter, and the industrialists endeavoring to secure French coals to avoid the high rates of British fuels.

Production of coal in France is not now equal to consumption, due to far greater needs for coal than can at present be met by the country's mines. Since the war, the developing of central heating process, gas and electricity, industries have been extended and agriculture and several other branches of business have also increased their requirements for coal.

The demand for consumption in house coal is very quiet, and consequently the Paris market prices remain unchanged.

News Items From Field and Trade

ALABAMA

Ray Coal Co. has been incorporated in Montgomery, with a capital of \$9,000, by F. V. Brahan, R. Crisman and others.

Goodwin Coal Co. has been incorporated in Dora, with a capital of \$100,000, by Olin Goodwin, M. E. Moore and C. L. Jones.

Moss & McCormick, Birmingham, have leased 1840 acres of government mineral land in Fayette county, Ala., for coal mining, at a cost of \$85,000.

The Riley & Kincaid Coal Co. has been incorporated in Henryeklen by Bush Riley, J. B. Kincaid and W. N. Lee.

The Goodwin Coal Co., of Montgomery, proposes to build a railroad in Jefferson and Walker counties to reach its coal properties.

R. A. O'Rear and Ed O'Rear, of Jasper, have leased their Pratt Warrior coal mine, on the Warrior River, for a period of five years, to the Gulf States Portland Cement Co., of Demopolis. The company agrees to mine and pay royalty on a minimum of 25,000 tons of coal annually.

Alabama coal men recently drew important assignments on the standing committees of the National Coal Association, as announced by President Brydon. S. L. Yerkes, vice-president of the Grider Coal Sales Company and also the owner and operator of several commercial mines, was named as one of twenty-five members of the policy committee and also is a member of the committees on government relations and railroad relations; J. W. Whately, now with the Tennessee Coal Iron & R.R. Co., but who will assume charge of the sales department of DeBardleben Coal Corporation in September, was designated as a member of the committee on foreign trade, and M. B. Lanier, of the Empire Coal Co., is a member of the publicity committee.

The Galloway Coal Co., of Memphis, Tenn., has let the contract for a brick commissary building at its plant at Carbon Hill.

One of the largest cash bonuses ever received by the government for the lease of a tract of public coal land was paid at the recent public auction at Montgomery by the Department of the Interior, when \$85,000 was offered and accepted for 1,840 acres. Moss & McCormick, coal operators of Birmingham, made the bid. The tract is located in Fayette County, near Carbon Hill. It is estimated to contain 7,000,000 tons of high-grade bituminous coal. In addition to the \$85,000 bonus the successful bidder must expend \$75,000 for improvements on the property within three years and must guarantee the government a royalty of 10c. per ton annually on a minimum production of 20,000 tons of coal. The Department of the Interior previously disposed of the surface rights of practically all the 1,840 acres of land to homesteaders, having reserved the coal deposits and the right to mine them, to the government. Many coal operators of Southern states appeared at the public auction at Montgomery and there was lively and spirited bidding to obtain the lease on the public coal lands offered.

ILLINOIS

The mine of the Bissell Coal Co., five miles northeast of Springfield, has resumed operations after having been closed down since May 1. A new airshaft has been installed, new locomotive haulage and track scales opened and other minor improvements made. The mine employs 274 men.

Charging that the Liberty Coal & Mining Co., Belleville, has exceeded the boundaries of the coal lands it owns and has mined approximately 500 tons belonging to others, a bill in trespass has been filed in the Circuit Court at Belleville. Plaintiffs in the action are Anna Maria Seibert; Robert Henry C., Oscar, John F. and Theodore Seibert; Lena Helms, Hilda Dickhaut, Anita Lautenschlaeger, Ella Mueller, Meta Walters and Edna Seibert.

The mine of the Southern Coal & Mining Co., at Shiloh, near Belleville, is undergoing extensive repairs. Work was started three weeks ago on retimbering the main shaft and later the airshaft will undergo a similar improvement. The work is

progressing somewhat slower than under ordinary conditions due to the fact that the shaft is being enlarged 5 in. on the sides to permit better handling of the boxes. It will take several weeks to complete the work. Meantime, the miners are not at work.

A verdict awarding \$1,000 damages has been returned by a jury in the St. Clair County, Circuit Court in the suit of Samuel Richards against the Gundlach Bros. Co. Richards asked \$1,250 for damages done to a 12-acre tract of land near Edgemont, caused by the roof of a mine below collapsing and the surface of the ground sinking about 1½ ft. in trenches having a total area of one-third of an acre. It was said at the trial that the coal company was willing to fill the depressions but the Richards maintained that the value of their property had depreciated and that possible purchasers would not buy because of a fear of further settling of the ground.

Members of the United Mine Workers will not be allowed to return to work in mine No. 2 of the Sangamon Coal Co., Springfield, it was announced by Superintendent John Vose, Sr. The 400 men are barred on the ground that their contract was violated when they started a walkout two weeks ago, and their organization has been sued for \$16,800. The men will be given back their places when the sum is paid the operators for damages said to have been caused by the shutdown. The strike was called Aug. 2 by J. J. Young, district board member of the union, because the company refused to pay wages of Jacob Reinhardt, a locomotive engineer at the mine and a member of the miners' union, for the six months between the time he was discharged because of defective sight and the time he was reinstated at the instigation of a committee of the union which investigated the case. The amount of the company's claim for compensation for damages caused by the walkout is determined, Mr. Vose said, by figuring \$3 a day for each miner.

The Babbitt mine, at Maquon, has been leased to H. F. Echor, of Rich Hill, Mo. A new shaft will be sunk about 300 feet north of the old shaft and the latter will be used as an airshaft. It is expected that the mine will be in operation for the autumn and winter trade.

Suit for the appointment of a receiver to take over the properties of the Beatty Coal Co., Mascoutahs, has been filed in the Circuit Court at Belleville. The suit, which is entitled a bill in chancery, relates that 240 shares of the stock of the company are held by Howard Kerchner, Anna Kerchner and Richard S. Wangelin, while thirty shares are held by the Beatty brothers. Kerchner is president of the company, Nephi Beatty, vice-president and Wangelin, secretary. Last month the mine was closed down by the state authorities on the ground that it was unsafe. It was stated that the shaft needed retimbering. At that time there were outstanding claims against the company of \$2,109.88, most of which was due miners. The bill states that \$3,000 is required to repair the mine to meet state requirements.

INDIANA

The Ogle Coal Co., of Indianapolis, has increased its capital stock from \$100,000 to \$150,000.

The Indiana Hocking Coal Co., of Terre Haute, has filed certificate of final dissolution.

The Wilfred mine, northeast of Sullivan, which has been shut down for several months, is being cleared up, preparatory to resuming operations. The mine employs 200 men.

Work on the E. & I. division of the Big Four R.R. is progressing rapidly. Samuel D. McLesh, of Evansville, an officer of the company, is authority for the information that the work of replacing rails will extend as far as Elberfeld during this month. Curves in the road at Petersburg and Washington are being straightened. The company hopes to make the E. & I. division the heaviest coal carrier in the state as a result of the completion of the \$1,000,000 improvements now under way. The road will be able to handle 1,000 cars of coal daily during the rush season when the improvements are completed.

The Southwestern Indiana Coal Corporation has been incorporated to mine and deal in coal, with offices at Evansville. The capital is \$200,000. William F. Tuarrie, Frederick W. Reeve, Tom J. Phillips, Lorin G. Julian and L. C. Oliver are the incorporators.

The Enterprise Coal & Mining Co., of Sullivan, has filed a preliminary certificate of dissolution.

IOWA

The Peoples Fuel Co., Cedar Rapids, has been incorporated with capital of \$20,000 by Frank J. Chramosta, president; W. F. Kubig, vice-president; George J. Naxers, secretary; and Frank O. Kanak, treasurer.

Leases are being obtained and drilling is expected to start soon on land in the vicinity of Decatur for coal and oil. Some delay has been experienced in getting the leases but this trouble is expected to be overcome and work is to start soon.

KENTUCKY

The North Star Coal Co. has been incorporated in Madisonville with a capital of \$100,000, by L. C. Oliver, L. P. Sisk and others.

Walter Waltrip, formerly manager of the Grapevine Coal Co., at Madisonville, who recently took charge of a new buying office at Madisonville, for the Phoenix Fuel Co., Louisville, has joined the Louisville office of the company, where he will be actively engaged in the future.

Val Bittner, organizer for the United Mine Workers, has called a meeting of the Straight Creek and other organized mining districts in southeastern Kentucky for the first week in September. These miners are working under what is known as the "Knoxville agreement" and in event of a strike in the hard coal field it is apparent that Bittner intends to rekindle the trouble that there was in southeastern Kentucky three years ago.

MARYLAND

Five were shot in rioting and clashes between union and non-union miners at Frostburg on the night of August 26 as a result of intense feeling which developed over the slaying of George Porter, a union miner of Zihlman.

With the purchase of 800 acres of coal land by the Stanley Coal Co., Inc., from John A. Connell, Ellen Connell and Parley DeBerry, further development of coal properties in Garrett County is presaged. The acreage thus acquired is on the line of the Baltimore & Ohio near Hutton and borders on the West Virginia-Maryland state line, extending as far south as Crellin. The price paid is understood to have been \$20 an acre. The coal acquired ranges from 3 to 5 ft. in thickness. The purchasers of the Connell tract will develop on an extensive scale, driving new openings and erecting the necessary tipples and other plant buildings.

MASSACHUSETTS

A resolution urging the government to take over and operate the coal mines of the country was adopted at the convention of the Amalgamated Shoe Workers of America at Boston, Aug. 22. The secretary was instructed to send copies of the resolution to President Coolidge and the members of both houses of Congress. As reasons for the suggested government action the resolution charged that New England and other sections of the country face a coal shortage "because a few favored men are permitted to monopolize and gamble in a necessity of life."

Resolutions have been sent to President Coolidge and Attorney General Daugherty by the Associated Industries of Massachusetts, comprising more than 1,500 manufacturers, opposing any recognition of the "check-off" and declaring "the action of the United Mine Workers of America in threatening to deprive not only New England but the entire American public of a sufficient supply of anthracite coal unless they be granted a monopoly of employment is opposed to the public interest and recognized public policy and should, therefore, be resisted."

MINNESOTA

F. A. Taplin, of the Western Coal Co., Cleveland, and Mr. Hutchinson and Mr. Atwater, Jr., of the W. C. Atwater Coal Co., of Cleveland, visited Duluth last week. They are interested in the Inland Coal & Dock Co. property and were on a tour of inspection.

These officers of the Washburn Lignite Coal Co., of Minneapolis, were recently

elected: W. P. McComber, president; Stanley Washburn, vice-president; Jefferson Steiner, secretary-treasurer. W. H. Keller, who has been secretary-treasurer of the company since its incorporation in 1902, retired at the age of 78. He remains a director.

The answer of the Great Lakes Coal & Dock Co., Minneapolis, to the suit of the West Jellico Coal Co., Paducah, Ky., for damages for alleged breach of contract sets up that the Jellico company nullified its contract through failure to deliver coal as agreed during the early months of the contract. The defendant says that had there been delivery during the first five months of the contract it could have used the coal to good advantage, but when the bottom fell out of the market, then plaintiff was eager to deliver at the high price, while the defendant was then able to get a better grade of coal elsewhere for no more money.

A suit for damages for breach of contract has been filed in Minneapolis by the West Jellico Coal Co., Paducah, Ky., against the Great Lakes Coal & Dock Co., Minneapolis. The complaint sets forth that a contract was made to furnish the Great Lakes Company with two cars of coal a day from June 26, 1920, to March 31, 1921, at \$4 a ton, but if car shortage should prevent complete delivery, the delivery should be on a pro rata basis as compared with the total contract business of the mine. Cost of production is set at \$1.82 a ton, and the headline writers see in the difference over 100 per cent profit. The complaint sets forth that car shortage did prevent full deliveries during June, July, August and September, but contends that deliveries were made as agreed and adjusted with the defendant but that in October there was a drop in the market and defendant was able to get coal from other sources at reduced prices and declined to give shipping orders on the contract, though they were often requested. Within the period from Oct. 25, 1920, to March 31, 1921, the defendant should have received 262 cars averaging 49 tons each, which plaintiff claims it was able to deliver, aggregating 12,838 tons of coal at a total price of \$51,352. Complaint sets forth a loss of profit of \$27,986 by the non-performance of contract and asks \$5,543 additional cost of operation on reduced output which added 35c. to 36c. a ton.

MISSOURI

The Edgar Zinc Co., of St. Louis, has paid \$77,000 for 159 acres of coal land and a big steam shovel that has been operated four miles southeast of Liberal in Barton County. The shovel and part of the land belonged to the Barton County Coal Co.

Walter and Elmer McDavid have purchased a one-third interest in the coal mine at Excelsior Springs, paying, it is reported, \$25,000 for the holdings. Perry Rice, the seller, will devote all of his time to his mine at Rayville. There will be no change in the management or operation of the Excelsior Springs mine.

The St. Louis & O'Fallon Coal Co., of Illinois, with a capital of \$150,000, has been incorporated in Missouri with a capital of \$50,000 and with headquarters in St. Louis. The incorporators are: E. L. Thomas, H. M. Needles and W. A. Reiss.

Coal in Carthage contracted for the various school is selling at about 25c. a ton less than a year ago. The School Board now is paying \$3 a ton for best mine run and \$4 for the best lump on the track at the mines at Pittsburg, Kan.

A new company has been organized at Yates to engage in strip-mining on the Stahlman farm and a stripping machine has been purchased at a cost of \$45,000 to carry on the work. The coal will be hauled by trucks from the farm to Yates over a road that will be oiled by the coal company.

The Kansas City Midland Coal & Mining Co. has closed mine No. 7, at Novinger, under order of Emmett Corrigan, general manager. C. L. Charleton, superintendent of the mine, declared that rock is falling so fast that more rock is being mined than coal. Three hundred miners are affected by the shutdown.

Operators of coal mines in Fulton announce that they will file an injunction suit with Judge David H. Harris of that city to prevent the board of managers of the Missouri School for the Deaf from carrying out a contract for the delivery of coal with a Moberly company on the ground that the bid was accepted contrary to law and contrary to their advertisement for the receipt of bids. According to statements given out by attorneys who have been retained by the Fulton operators the bid of the Moberly concern was for coal delivered at the station in Fulton, whereas

the law requires that the bids be on the basis of coal delivered to the institution. As a result there was no way to draw a comparison on the bids yet the Fulton operators contend that their bid was the lowest. Their bid was for coal delivered to the institution. Officials of the School for the Deaf said they had not yet entered into a contract with the Moberly company and will await the outcome of the injunction suit.

NEBRASKA

Governor Charles W. Bryan on Aug. 20 announced that he was making arrangements to have the state supply cities, villages and public committees with coal at \$6.25 a ton, f.o.b. Lincoln, with an additional delivery charge of not more than \$2 a ton. He said that he was moved to this action by the fact that, although the price of coal at the mines had been reduced \$1.25 a ton, Lincoln dealers were selling it at the same price quoted last winter and spring. With the maximum \$2 delivery charge, the state would furnish coal at \$8.25 a ton. Lincoln dealers are charging \$9.50 a ton for delivered coal.

NEW YORK

Wesley Lieb, who was sales manager of the Majestic Coal Co., New York City, has been placed in entire charge of sales. Three additional salesmen have been added to the sales force. A. J. Jaeger and E. J. Fraunheim will look after the New Jersey trade, and A. P. Crouze will cover the New England States.

Certificates of incorporation were filed Aug. 23 in the office of the Secretary of State at Albany, by the Williams Fuel Corporation, of Manhattan Borough, New York City, to deal in coal, coke, etc. The capitalization is 100 shares of common stock of no par value and the incorporation will commence business with \$500 paid in. Directors are Henry M. Williams, James E. Doherty and Patrick Doherty. Attorney for the corporation is James E. Doherty, of 150 Nassau St., New York City.

A certificate of incorporation has been filed in the office of the Secretary of State at Albany by the New York Central & Lake Shore Fuel & Products Co., Inc., of Troy, to deal in peat for fuel and fertilizer. The company is capitalized at \$15,000, of which \$2,500 is paid in. The directors are: Neils Schmidt, Troy; John A. Griffin, Watervliet, and George Benedict, Albany, N. Y. The attorney for the corporation is Henry J. Crawford, 128 State St., Albany.

A certificate of incorporation has been filed in the office of the Secretary of State at Albany by the Wilba Coal Co., Inc., of New York City. The corporation is capitalized at 100 shares of common stock of no par value and begins business with \$500. The directors are Charles E. Kelley, L. B. Grunder and A. G. Levick, all of 366 Madison Avenue, New York City. Attorneys for the corporation are Kelley & Becker, of 366 Madison Avenue.

The Lake Shore Coal & Coke Co., Inc., of Buffalo has filed a certificate in the office of the Secretary of State at Albany, reducing its capital from \$50,000 to \$5,000.

Albee & Albee, Inc., Buffalo, has filed a certificate of incorporation, to deal in coal, coke and builders' supplies. The corporation is capitalized at \$20,000, but begins business with \$10,500. Directors and subscribers to stock, E. H. Albee, H. M. Albee, and Wm. E. Mason, Buffalo; attorney, H. M. Albee, Buffalo.

In a letter to Governor Smith, Assemblyman George N. Jesse, last week, suggested an extraordinary session of the Legislature to re-enact the legislation of last year under which a fuel administrator was appointed by the Governor. Viewing "with grave alarm" the possibility of a stoppage in the mining of hard coal, with its resulting hardships, a situation similar to that existing a year ago, the Assemblyman says he would be glad to co-operate with the Governor in drafting a more drastic law than that which expired in April. Senator James J. Walker, Senate leader, hearing of Assemblyman Jesse's action, expressed the opinion that state officials could do very little in the situation, as no coal is mined in this state.

OHIO

J. Benham has qualified as trustee in bankruptcy in the case of the Clear Creek Coal Co. and has been accepted by Commissioner Greve.

E. K. Brooks, traffic manager of the W. E. Deegans Coal Co., of Huntington, was a visitor in the Cincinnati market during the latter part of August.

Assistant District Attorney A. Lee Beatty, of the southern district of Ohio, has

prepared his answer to the suit of the Houston Coal Co., seeking to recover \$314,000 for coal that was delivered to the navy under requisition.

The eleventh annual midsummer outing of the Cincinnati Coal Exchange was held at the North Cincinnati Gym. grounds at Bass Island on July 24 with over 100 in attendance. It was the largest gathering of coal men at such an affair in the history of the organization. Weightman D. Roberts, as a delegate from the Charleston Coal Exchange, asked that delegates be selected to attend a meeting in Columbus to look to the formation of a National Coal Inspection Bureau. In a talk to the Exchange Mr. Roberts declared that it was necessary that such an organization be effected in order to counteract the inordinate number of rejections that have been made during the past few months. He said that these were really controlling the downward trend in price. A special meeting of the Exchange was called to consider the problem. The outing closed with a ball game in which the Low Volatile side won from the High Volatiles by a score of 12 to something or other.

The Columbus Coal Bureau, a social coal club, composed of producers and jobbers, was organized at a meeting of about fifty representative concerns, at the Chittenden Hotel, Aug. 3. While the organizers are not disposed to give a complete description of the objects of the organization, it was denied that it was the intention to affiliate with the proposed National Coal Inspection Bureau, although some of those present appeared to believe that such was the object. The organization is the outgrowth of a number of informal meetings of the coal men in the producing and distributing ends of the industry. A board of directors, consisting of Fred W. Braggins, president of the Lorain Coal & Dock Co.; John M. Taylor, head of the J. M. Taylor Coal Co.; J. A. Teegardin, sales manager of the New York Coal Co.; C. M. Anderson, western manager of the Elk River Coal & Lumber Co.; Jay Miller, president of the Jay Miller Coal Co., and T. C. Collins, of the Ajax Block Coal Co., was named. The directors met and after discussing the situation decided to put off the selection of officers for a week, in order that the situation could be canvassed.

PENNSYLVANIA

Joseph E. P. Bonsall has been made manager of the Philadelphia office of the Bowman Coal Co., in the place of Archibald W. Garvin, who has severed his connections with this company.

TENNESSEE

The Southern Fuel Corporation, of Chicago, Ill., has acquired and will develop 25,000 acres of coal land in Tennessee.

TEXAS

The Palestine Coal Co. has been incorporated in Palestine, with a capital stock of \$150,000, by R. McDonald, T. C. Ritchey and L. A. Wadsworth.

WEST VIRGINIA

A visitor in the New River field of West Virginia a few days ago was Robert Green, in charge of the coal department of the Matthew Addy Coal Co., of Cincinnati.

C. H. Jenkins, vice-president of the Hutchinson Coal Co., of Fairmont, was a visitor in Eastern markets during the latter part of August.

Construction of a bridge across Elk River at upper Clendenin, in Kanawha County, is being urged as a means of making possible the development of what is said to be one of the best veins of coal on Elk River.

C. E. Cowan, of Greensburg, Pa., chief engineer of the Jamison Coal & Coke Co., spent a few days in Marion County, during the latter part of August.

Charles E. Hawker, well known in northern West Virginia mining circles, was a recent visitor in New England.

J. R. Thomas, president of the Carbon Fuel Co., of Charleston, has almost completely recovered from a recent illness.

M. K. Dobbie, of the Robinson Coal Co., and his brother, W. C. Dobbie, general superintendent of the Jamison Coal & Coke Co., in the Fairmont region, found it necessary to go to Douglas late in August owing to the serious illness of their father.

R. A. Pollock, formerly president of the Rivesville Coal Co., the properties and mines of which were sold not long ago to the Edward Hines interests of Chicago, has completed plans for the purchase of the mine of the Balkan Coal Co. at Dola on

the West Virginia Short Line of the Baltimore & Ohio R.R. The mine is being cleaned up preparatory to resuming operations, with the new owner in charge, in the near future.

Some idea on the large scale upon which operations are being conducted in the Scott's Run field of Monongalia County may be obtained from the fact that \$284,590.99 was paid out in wages by one bank in Morgantown toward meeting the payrolls of several coal companies for the first half of August, representing the work done during the latter part of July.

The Glenn Valley Coal Co., which was organized in July, has purchased two tracts of coal land in Ohio County aggregating about 56 acres, with a view to development. The consideration involved was approximately \$30,000. In one tract there were 31 acres, for which \$12,000 was paid, and in the other tract there were 26 acres, for which \$18,000 was paid.

Early this month in Greenbrier County there will be a reopening of the investigation into the alleged attempts of agents of the United Mine Workers to bribe jurors in the case of William Blizzard, president of subdistrict 2, District 17, charged with the murder of George Munsey in connection with the armed march on Logan County in 1921. Blizzard's first trial ended in a disagreement of the jury. It will be recalled that following rumors that the United Mine Workers were using money to influence jurors and prospective jurors, Judge Summers H. Sharp summoned a grand jury, which filed true bills against H. R. Harrah, widely-known farmer who had served as foreman on the jury which had been unable to agree upon a verdict, and against G. Clarence Hickey, an agent for the miners' union. Blizzard is also slated for a second trial soon after Sept. 7, when the regular term of court begins. A new jury will be summoned, as every member of the jury panel summoned for the second trial was dismissed by Judge Sharp when it became known that efforts were being made to influence prospective jurors.

George Wolfe, secretary of the Winding Gulf Operators Association, with headquarters at Beckley, was a visitor in Huntington recently, attending a traffic meeting there.

J. O. Caldwell, chief clerk of the Northern West Virginia Coal Operators Association was a recent visitor in Charleston. His headquarters are at Fairmont.

Fire of unknown origin completely destroyed the tippie at the No. 2 mine of the Eagle Island Coal Co. at Lax, in the Logan County field, late in August and at the same time seriously damaged three motors, one cutting machine and two mine cars. The damage wrought is estimated to have been approximately \$40,000 part of which sum is covered by insurance. The tippie was located about 800 ft. up the side of a mountain and a large steel bucket used to convey coal to a lower tippie tumbled down the mountain side when its cables were burned, almost completely demolishing the lower structure. It was necessary to shut down the mine following the fire, the miners being transferred to the No. 1 mine of the company. It will require several months to complete repairs so that the No. 2 mine may be operated again.

West Virginia's exhibit at the second annual exposition of the Women's Activities Association to be held at the Commodore hotel in New York on Sept. 24 will consist of working models of coal-mining equipment, photographs of West Virginia mining towns and samples of the various grades of coal mined in the state. Arrangements were made by J. O. Caldwell, secretary of the Northern West Virginia Coal Operators Association, for the exhibits from the southern part of West Virginia. The Women's Activities Association is an auxiliary of the Federated Business and Professional Women's clubs and the exhibition is to be held for the purpose of showing the principal industries of the various states in the Union.

WASHINGTON, D. C.

The Foreign Trade Committee of the National Coal Association for the coming year embraces the following: C. E. Bockus, president, Clinchfield Coal Corporation, New York; Lemuel Burrows, president, Castner, Curran & Bullitt, Inc., New York; G. H. Caperton, president, New River Coal Co., Charleston, W. Va.; G. Dawson Coleman, Sr., president, Marshall Coal Co., Philadelphia; George M. Dexter, president, Dexter & Carpenter, Inc., New York; T. F. Farrell (chairman), second vice-president, Pocahontas Fuel Co., New York; George H. Francis, secretary, Keystone Coal & Coke Co., Greensburg, Pa.; R. H. Gross, president, New River Co., Boston; Kuper

Hood, general manager, Houston Coal Co., Cincinnati; R. H. Knode, vice-president, Stonega Coal & Coke Co., Philadelphia; F. A. Sweet, president, Standard Coal Co., Salt Lake City, Utah, and F. W. Wilshire, vice-president, Consolidation Coal Co., New York.

CANADA

Output of coal from Canadian mines during May amounted to 1,252,000 net tons, a decrease of 3 per cent from the tonnage for the previous month, but an increase of 29 per cent over the average for the month of the preceding years. The output for the month showed decreases of 30,000 tons in British Columbia, 25,000 tons in Nova Scotia and 12,000 tons in Saskatchewan. In Alberta there was an increase of 29,000 tons and in New Brunswick 3,000 tons. The cumulative output from all mines for the five months of 1923 amounted to 7,406,100 tons, an increase of 26 per cent over the preceding three-year average for the same period. Comparison of May and April figures covering the importation of coal from the United States and Great Britain showed an increase of 44 per cent. May imports amounted to 1,683,700 tons, while in April 1,171,200 tons was brought in. The May importations this year were 73 per cent greater than the preceding three-year average for the month. There were no imports from Great Britain during the month. Total importation of all coal for the five months of 1923 was 7,640,500 tons, an increase of 42 per cent over the three-year average for the period. The imports of anthracite for May totalled 433,000 tons. This was 4 per cent greater than in April and 52 per cent higher than the three-year average for the month. All of the anthracite imported in May came from the United States. The total amount imported during the five months of 1923 was 2,186,000, an increase of 44 per cent over the three-year average for this period. Exports of Canadian coal during May were 23 per cent less than in April. The quantities were: May 99,100 tons, April 128,600. Comparison of the May exports with the preceding three-year average showed a decrease of 22 per cent.

Obituary

James R. Bresnan, a well-known business man of Brockville, Ont., and head of the retail coal firm which bears his name, died recently in that city at the age of 76. He was a native of Buffalo.

C. J. Thomas, representing the Morton Gardner Electrical Co., of Chicago, was crushed to death between two cars in the mines of the Moffett Coal Co., at Blocton, Ala., Aug. 11, while demonstrating the equipment to officials of the coal company.

Joseph R. Smith, superintendent of houses at the Johnetta Mine of the Bertha-Consumers Co., died recently at Johnetta, Pa. Mr. Smith had been married almost fifty years and during his entire life he was in constant employ of the Jones interests. He was the father-in-law of David McKelvey, a member of the Johnetta first-aid team, which at the time of his death was en route to Salt Lake City to attend the International meet. Funeral services were held at Johnetta, Pa., Sunday, Aug. 26.

J. Eugene Dana, retired coal operator and prominent citizen of Charleston, W. Va., for many years, died late in August at Crescent Manor Farm, Keswick, Va., near Charlottesville, where he had gone to spend the summer. Mr. Dana's death was the direct result of a series of strokes of apoplexy, from which he had suffered for several weeks prior to his death. He was not only interested in coal companies but also in many other enterprises in Kanawha County, W. Va.

Charles Crocker Bussey, inventor of the Bussey Process, died suddenly Aug. 29 while visiting his family home in Winterport, at the age of 57 years. His home was in Brooklyn. His invention constituted a great economic advance in the method of low-temperature distillation of coals in the production of oil, coke, acetylene and gas from bituminous coals, cannel, lignites and oil shales and his passing away came at the crowning moment of his life after devoting many years to the development of his process. Mr. Bussey was born Jan. 16, 1866, in Newburgh, Me., the son of a sea captain and one of a family of nine children. He was a descendant of Benjamin Bussey, founder of the Bussey Institute of Harvard University. His early education was received in the local schools and at Bucksport Seminary with intervals

of work on farm and sea. He was graduated from the Massachusetts Institute of Technology in 1895.

Victor White, Western manager for the Flat Top Fuel Co., died recently at his home in Fort Thomas, Ky. He had been ill for over a year, first from an automobile accident, then influenza and finally typhoid fever. He got his early training in the coal business with the Berwind Fuel Co. in Chicago, joining the Flat Top organization about ten years ago and opening their Cincinnati office some six years since. He had been vice-president of the Cincinnati Coal Exchange and was one of the prime movers in the organization of the Cincinnati Coal Trade Golf Association. He was 33 years of age and leaves a wife and three children.

Traffic News

Notwithstanding reports that there has been curtailment of coal shipments, figures covering coal tonnage handled by the Chesapeake & Ohio and the Norfolk & Western in southern West Virginia in July show an actual increase over June or more than a quarter of a million tons for each road.

During the latter part of August President C. W. Huntington; Vice President C. H. Hix, Chief Engineer H. Farnstrom and Electrical Engineer Clark, of the Virginian Ry., visited the Winding Gulf field for the purpose of studying the extensive improvements contemplated by the road and more especially the electrification of the road from Mullens to Roanoke, Va.

Locomotives in need of repair on Aug. 15, totaled 11,571, or 18.1 per cent of the number on line, according to the Car Service Division of the American Railway Association. This was an increase of 16 over the number in need of repair on Aug. 1, at which time there were 11,555, or 18.1 per cent. The railroads on Aug. 15 had 2,667 locomotives in storage ready to be used whenever traffic conditions warranted. This was an increase of 117 over the number in storage on Aug. 1.

At a meeting at Deer Park, Md., late in August, the Northern West Virginia Operators Association retained the service of E. J. McVann, traffic attorney, of Washington, D. C., to handle its rate fight before the Interstate Commerce Commission. This involves the petition of the operators in the Pittsburgh No. 8 field of Ohio and in the Pittsburgh district attacking all coal rates to the lakes from Fairmont and Kentucky. Already southern West Virginia producers are making a fight to maintain the present rates. The northern West Virginia Association contends that the freight rates of the Pittsburgh field and the No. 8 field are unjust to the Fairmont district. The understanding is that the Baltimore & Ohio R.R. will assist or co-operate with the Northern West Virginia Association in its case before the Commerce Commission. At the Deer Park meeting the Northern West Virginia Association was represented by C. H. Jenkins, George S. Brackett and Brooks Fleming, all of Fairmont; A. Lisle White, of Clarksburg; E. W. Ziler, of Elkins, and George Connell, of Connellsville.

Coming Meetings

New York State Coal Merchants' Association will hold its annual convention on Sept. 10-12 at Sacandaga Park, N. Y. Executive secretary, G. W. F. Woodside, 250 Arkay Building, Albany, N. Y.

Oklahoma Coal Operators' Association will hold its annual meeting Sept. 13 at McAlester, Okla. Secretary, A. C. Casey, McAlester, Okla.

The American Mining Congress will hold its twenty-sixth annual convention in conjunction with the National Exposition of Mines and Mining Equipment, Sept. 24-29, at the Milwaukee Auditorium, Milwaukee. Secretary, J. F. Callbreath, Washington.

National Safety Council will hold its twelfth annual safety convention at the Buffalo Statler Hotel, Buffalo, N. Y., Oct. 1-5. Secretary, W. H. Cameron, 168 No. Michigan Ave., Chicago, Ill.

The West Virginia-Kentucky Association of Mine, Mechanical and Electrical Engineers will hold its annual meeting Oct. 19-20 at Huntington, W. Va. Secretary-treasurer, Herbert Smith, Robson-Prichard Bldg., Huntington, W. Va.

Coal Mining Institute of America will hold its annual meeting Dec. 19, 20 and 21 at Pittsburgh, Pa. Secretary, H. D. Mason, Jr., Chamber of Commerce Building, Pittsburgh, Pa.

COAL AGE

The Only National Paper Devoted to Coal Mining and Coal Marketing

C. E. LESHER, Editor

Volume 24

NEW YORK, SEPTEMBER 13, 1923

Number 11

Credit Pinchot

ALL records were broken by Governor Pinchot when in two weeks he brought the anthracite operators and mine workers together on a settlement. Although neither side wanted a strike both gave every outward appearance of a willingness to see one through to a finish. But their heart was not in it. Nor was the consumer at all interested in having a grandstand seat at such a performance. It has loudly said "enough" and expressed its preferment for coal to contest. Nor did it rise to the bait of soft coal for the winter.

The Governor wants the credit; he should have it—all. He took on the job voluntarily; no one asked him in, other reports to the contrary, notwithstanding. The administration at Washington, acting through the Coal Commission, held and maintained the position that it was the business of the contestants to put their own house in order. Governor Pinchot, however, gets the credit for having justified Mr. Hammond's optimism.

Direct negotiations having failed twice, the Governor proceeded with his self-appointed task as savior of the country and of the treasury and well-being of the magnificent Commonwealth of Pennsylvania, in good sound trading fashion. He took counsel with the idealists and acted practically. He first assembled his facts. Here they are:

The public wants coal and not a strike. Fact one.

Controversies of this character when arbitrated always end in compromise. Neither side gets what it wants but takes less. Why, therefore, waste time? Get down to business at once and have it over with the sooner. Fact two.

The operators can be forced to come to terms at any time, so find the best possible terms the miners will accept and you have—Fact three.

The Republic expressed its gratitude to President Roosevelt for settling one anthracite strike. Fact four.

The other facts he had, or could have had, or thought he had, were just statistics. The statistics show, for instance, that with few exceptions the men working 200 or more days per year earn from \$1,200 up to more than \$4,000. The minimum outside day wage is \$4.20 and some contract miners average \$14 and more per day. Adding 10 per cent to each raises the lower-paid group by \$120 per year and to those already high it adds \$400. The Governor's plan of justice for all means 42c. per day to some men and \$1.40 to others. Thus he pricks a sore spot deeper.

"Yes, yes," one can hear him say as he registers impatience and worry, "that is some thing for the future, because to fix up those inequalities now would take at least six months. The prestige of this job demands action." So he sticks to his own facts. The only statistical fact that he needed was the amount his 10-per cent increase in wages would add to the price of coal. He announced a minimum on that and told the people that though they would have to pay it, they should not, and

that maybe some time, some way, they would not. Why bother, anyway, as they are to get anthracite to burn?

Just sum up Mr. Pinchot's achievements. The miners are satisfied. In fact they displayed unseemly haste in accepting the Governor's last proposal, the press account of the meeting on Friday of last week noting that four minutes after Mr. Lewis stated it to the full scale committee it was accepted. Capellini was so delighted that he stood on his head. It is a good deal for them because it is a gain with no losses.

He took the responsibility off the operators of naming an increase and telling the public what it would cost them. If that was to be the outcome, the producers should be grateful. He shortened the strike to a mere vacation, for which the public is appreciative. He added nearly a million dollars a year to the treasury of Pennsylvania. For this his constituents will have no complaint.

Governor Pinchot is entitled to the credit; let none withhold it.

Cogitation for Soft-Coal Operators

THERE is enough in the anthracite settlement and the manner of its coming to give the soft-coal industry food for considerable thought this winter. The strike was avoided as a matter of political expediency and by giving the miners nearly half the wage increase they had demanded. No one but the officials of the United Mine Workers and the *New Republic* claimed that as a whole they really needed more money. The earnings of the best-paid class without the increase are comparable with top notchers among the soft-coal miners.

Next spring the soft-coal mine contract will expire. It will be a presidential year and a strike would be considered most unfortunate. It is a safe guess then that the mine workers will weigh their chances of winning and will demand a 10-per cent increase. This one came so easy for the hard-coal workers as to hearten the soft-coal men.

Against this must be considered the market possibilities. By now the stock of soft coal in the hands of consumers is close to 60,000,000 tons. This is a high figure, but no more than is warranted in view of the character of industrial activity and the warnings of the railroads that they would need their facilities this autumn for other products. If, as seems to be happening, consumers scent a strike in the soft-coal fields next April, they will keep these stocks for possible later use and buy for current use this fall and winter. If as spring approaches a strike seems imminent, more coal will be stored.

This anticipation of a strike alone will hold up the market this winter. Without it prices will drag. The usual fall snap will be absent because consumers are so well fortified with stocks. It is hard to get a buyer excited when he has two or three months' supply on

hand, though when a buying panic starts none is immune.

With a dull market behind them the union soft-coal operators will be little inclined to grant a wage increase. Instead, they will think back on 1921 and, considering the possibility of non-union competition with reduced wages, will want a reduction of wages in their next contract. A downward reaction in the business world next year will intensify this feeling.

That the check-off has been given such scant attention by Governor Pinchot and by the Coal Commission will give the soft-coal operators ground to hope that they can succeed in throwing it out. The possibility will be attractive to the operators.

Some hard-coal dealers are free to predict that they will be seeking orders for hard coal by Jan. 1. The steam sizes of anthracite will have hard sledding against soft coal this winter and Mr. Lewis may hope to return the favor to the hard coal operators by raising the cost of the soft coal that competes.

Meanwhile with production of bituminous coal over 11,000,000 tons a week car shortage is appearing in the East. The strength of the market will be known when buyers decide to take it or leave it as prices stiffen up.

How Different!

SEVERAL coal-mining engineers went on the trip to Ontario and Quebec with the American Institute of Mining and Metallurgical Engineers, and found the practice quite different in the metal mines from that in coal mines. These engineers are wondering—still wondering—that at one mine rock is being extracted and loaded for 17½c. per ton, that in the same workings wages averaged about \$4.50 per day for tonnage men and that the output per miner was about 26 tons. In fact the manager said he would not keep a miner on the job who could not load his 20 tons daily.

How different it is in the union mines of the United States, where the output is kept low, and the consumer, whether workingman or capitalist, is compelled to pay many times 17½c. per ton for the mining of coal in order that the miner can make big pay out of moderate output.

Along with the party in Canada was the Minister of Mines of Ontario, who genially and with pride stated that about half the selling price of the metal product in that province was profit. If that could be said of anthracite mining how great would be the lamentation on all sides, Canadian and American! As it is, with less profits in coal mining than in the mines of Ontario the public is continually demanding investigations. Canada is hardly a foreign country, but conditions in the mining regions of Ontario and Quebec looked strangely different from those in union coal mines of the United States; so different that it might have paid the U. S. Coal Commission to be along to ask just why these things should be so.

But, after all, perhaps it is no great loss that the facts of the coal controversy are not exposed. The public and the politician do not want to know the truth for that would hamper them in following their purposes to the end. Even the most upright of men are disposed to seek the expedient course. The public must save itself from coal shortages and high prices, the politician, or statesman, if you will, must carry popular approval with him. So both are disposed to hedge when coal problems are at issue, and both try to back an improper

judgment with the best reasons and most convincing half lights they can contrive to find.

Everybody is prone to say he would execute judgment, but when the time comes he is likely to do what he is asked to do by the aggressive voter or what he thinks can be done with the least resistance, and he calls *that* justice, though he knows it is not. The wonder is that our judges are so free from this weakness which assails almost every other kind of public official and many of our newspaper editors, finding them utterly defenseless against its attack.

Earthquake in Japan

IN THE thickly inhabited area occupied by Tokio, Yokohama and Yokosuka, an earthquake probably unequalled in history in its death roll and damage recently occurred. Apparently it did not cover a large area—the three cities are not far apart, Tokio being about 20 miles from Yokohama—but it struck at the business center of Japan, razing the buildings while waves from the ocean, broken pipe lines, grounded wires and house and industrial fires completed the destruction and added to the number of victims.

The Japanese will bear their affliction with resignation and stoicism, as is their practice. They will rebuild their cities and will take up the thread of life where the earthquake snapped it. They will use their marvelous advances in surgery and hygiene to reduce as far as possible the effects of the catastrophe.

Their resources are not greatly reduced by the disaster. Advices are none too complete or reliable, but so far nothing seems to have been received that would indicate that the disaster seriously affected Osaka, Kobe, Kioto or Nagoya, four cities exceeding Yokohama in size, though all smaller than Tokio.

The main manufacturing and mining regions probably are not much, if at all, affected. The coal fields of the island of Kyushu lie five hundred miles to the southwest and those of the island of Hokkaido an equal distance to the north. There are coal mines on the extensive island of Nippon, where the earthquake occurred, but they are relatively unimportant except those in the Joban field, which is an active district and near the point of disturbance.

In view of the size of the islands, the great length of the crescent they occupy and the small area subjected to the earthquake shock the real sources of the wealth of Japan—its mining and manufacturing and the indomitable industry and will of its people—are not destroyed. In consequence the Japanese nation will recover speedily, even though it may be found that Tokio and Yokohama are no longer as suitable for large centers of population as in the past.

The United States sincerely condoles with the Japanese in their misfortune and is anxious to exhibit its sentiments and good will in something more substantial than mere words. There is need for money to care for the many dispossessed Japanese in the cities which earthquake and fire have destroyed. For these reasons the American Red Cross is making collections. Surely where the suffering has been and is so great the width of the Pacific Ocean and the profundities of the great Tuscarora deep will not act as bars to our good will and assistance. A people 110,000,000 strong such as ours should be able without much self-sacrifice to minister adequately to the sufferers of the small area of Japan thus terribly afflicted.

General View of Navajo No. 5

Navajo No. 5 Mine Turns Waste Piles Into Power and Solves Water Problem with 2,882-Ft. Well*

Boilers Operate Full Blast with Low-Grade Fuel and at a Low Rating with Bone—Precious Water Supply Is Derived from Three Levels in a Single Well and Purified

BY H. B. COOLEY

General Superintendent, Allen & Garcia Co., Chicago, Ill.

POWER for Navajo No. 5 mine of the Gallup American Coal Co., near Gallup, N. M., as well as for the company's old slopes now being worked out, is supplied by a central plant conveniently located adjacent to the main shaft. Provisions have been made for an ultimate boiler capacity of 2,514 boiler hp. (manufacturers' rating) and a total generating capacity of 6,000 kw.

The boilers, turbines, condensers and a part of the plant auxiliaries and piping were furnished from other plants of the operating company. Consequently the problem of the engineers consisted mainly of the proper assembly of these units and the combining of them with such new equipment as was necessary for satisfactory and economical operation.

Every effort was made to modernize this second-hand equipment and to bring it up to the standard of present-day power-plant practice. By a redesign of the boiler setting, the selection of high-grade stokers and the application of forced draft and superheaters the boiler installation developed into a very satisfactory plant. In like manner the application of direct-connected exciters to the turbines and the adoption of surface condensers for the old jet condensers eliminated all the objections to the use of this second-hand equipment.

It is certain that the saving in initial investment much more than offset any slight advantage that might have been gained by using new equipment throughout. Too often the danger in carrying out such a program is the tendency to attempt the use of second-hand equipment which is not suitable for the conditions imposed. A loss rather than a saving may result, especially when the plant operation is in any way handicapped.

There are a few features of unusual interest in the general layout, and perhaps the most interesting details

are in connection with the boilers, water supply and labor-saving accessories.

As is the case with practically every other coal-mining plant, the first requisite of a satisfactory boiler plant is the ability to utilize cheap fuel consisting of slack and refuse, which represents the unsalable product of a coal operation. That this plant has been able to do this is evidenced by the fact that much slack and refuse which had accumulated through years of operation of a neighboring mine have been utilized as fuel.

The present boiler plant (Fig. 1) consists of four 419-hp. horizontally baffled Heine boilers, each of which is being served by a forced-draft Harrington stoker 7 ft. wide by 14 ft. long. These stokers are capable of operating the boilers continuously at 200-per cent load with a fuel having 10,000 B.t.u. heat value and a total non-combustible content of 27 per cent. The rating of 200 per cent continuous or 250 per cent for short periods is set as the maximum at which this type of boiler should be operated. The stokers are suited for operation, but at reduced ratings, with fuel having as much as 45 per cent of non-combustible material.

The grate area of the stoker is sectionalized into four compartments so that the air pressure can be properly controlled by dampers over four areas independently, thus providing the proper quantity of air for each combustion zone.

The draft is furnished by motor-driven high-speed fans discharging into a common duct, the quantity of air and the pressure being controlled by a damper in the discharge duct. A concrete chimney 10 ft. in diameter by 240 ft. high provides the natural draft for removing the furnace gases.

The stokers are driven by independent vertical steam engines, and the stokers and the air pressure in ashpit and furnace are all automatically controlled by an Engineer Co. installation providing balanced draft control. The speed of the stokers and the air pressure in the

*This is the third part of Mr. Cooley's article on Navajo No. 5 mine. The first part appeared in *Coal Age*, Aug. 2, and the second on Aug. 16.

FIG. 1—BOILER PLANT BUILT FOR MAXIMUM ECONOMY

The pressure on the top of the fire is just a little over atmospheric, so there is no tendency for air to enter from outside through leaky doors or side walls, as is the case where there is a heavy vacuum. The pressure is regulated so that the fuel, which is sub-bituminous and tends to disintegrate in the fire, will not leave the grate surface.

ashpit are controlled primarily from the steam pressure. The pressure over the fire is controlled by a furnace-pressure regulator, and is set to hold approximately 0.08-in. pressure over the fire. A low pressure above the grate is essential for this installation because this coal disintegrates in burning and with a high draft the particles thus formed have a tendency to leave the grate surface with the furnace gases.

Up to the present, with a normal output up to 1,600 kw. and peak loads up to 2,000 kw., two boilers ordinarily have been carried on the line, but for short periods loads up to 1,600 kw. have been carried on a single boiler. With the load equally divided on two boilers the operation is extremely economical. The boiler and stoker efficiency range around 70 per cent with 14 per cent of carbon dioxide.

STEAM SUPERHEATED IN TUBES OF FOSTER TYPE

The boilers are set with the front headed 12 ft. above the floor line, which provides proper combustion-chamber content considering the characteristics of the fuel and the ratings at which the boilers are to be operated.

The superheaters are of Foster type and are located in the rear of the combustion chamber, being placed at a slight angle with the horizontal. The steam in them is superheated mainly by radiant heat. These superheaters are supported on cast-iron pipe of 6-in. and 8-in. diameter which have open ends that provide for a circulation of air of sufficient volume to prevent the pipe from being burned out.

Fig. 2 shows provisions for both a high-pressure water back and for high-pressure water cooling of the pipe

supporting the superheater support. It was later decided that this support could be properly maintained by air cooling alone.

The water back was entirely eliminated as being unnecessary, the air being sealed satisfactorily by an ash seal approximately 3 ft. long below the stoker chain. Owing to the fact that the ash pits are practically airtight and that the air pressure in the combustion chamber is held a trifle above atmospheric not much air courses over the rear of the stoker.

Several rows of Carbofrax brick are set along the side of the furnace directly above the grate. After much investigation, E. J. Franklin, consulting mechanical engineer for the coal company, recommended the installation of this material as a preventive against clinker adhesion, despite the fact that the temperature of the furnace approaches the melting point of the ash.

When driven hard the fire attains a dazzling white heat, and the slag or ash which adheres to the wall will melt down and drip off the sides. When the furnace operates at low ratings this slag will form again and will be melted off again whenever the temperature is increased sufficiently. Both the arch and the brickwork are thus well protected by this coating of ash, and it appears certain that the maintenance cost will be reduced to a minimum.

FIRE ARCH IS SUPPORTED BY STEEL BEAMS

Attention also is called to the method of supporting the Liptak arch. It will be noted that this is a double suspension arch carried by steel beams. These beams do not, however, rest on the side walls of the furnace setting, but are carried by steel columns independent of the brickwork. This method of support not only relieves the brick walls of a tremendous load, thus preventing cracking, but also enables repairs to be made on the side walls without disturbing the arch support.

The supply of water to the boilers is controlled by "Stets" feed-water regulators. Approximately 15 lb. of excess pressure is carried against these regulators, and when operated in conjunction with pump-pressure governors the water regulation of the boiler is automatic. Separate water columns are used and a bypass provided so that the feed of the boiler can be controlled by hand if necessary.

Coal is fed by gravity to the stoker hoppers from overhead bunkers. A Merrick Weightometer is installed on the conveyor that carries the boiler fuel to the bunkers. This device automatically registers the tonnage delivered to the power plant, enabling the management to determine the coal used in the power house and to check the railroad shipping weights against mine weights. This is a desirable feature as the miners are paid by the ton for the coal they load, and this furnishes a check against the total of the weights of the individual cars as recorded for them.

The stokers deliver the ash to enclosed hoppers located below the boilers in the basement. The ashes from these hoppers are drawn into a steel-lined ash car and are at present used for surfacing the mine yards and roads adjacent to the mine. When these ashes are no longer required for this purpose they will be dumped from the car onto an ash dump near the plant.

In the generating room are already installed a 1,500-kw. turbo-generator unit and three 500-kw. units. Provisions have been made and space left in the building for a 2,000-kw. unit.

FIG. 2—WATER-TUBE BOILERS WITH CHAIN-GRATE STOKERS, SUPERHEATERS, SUSPENDED ARCHES, SOOT CLEANERS AND FORCED AND CHIMNEY DRAFT

FIG. 3—CASING SIZES AND WATER CONDITIONS

The first water encountered was 300 ft. down, but the water obtained in sinking the hole to its final depth rarely rose above a point 600 ft. from the surface. Finally at a depth of 2,882 ft. a sufficient water supply was tapped. The water now rises to within 100 ft. of the mouth of the hole, the capacity being about 125 gallons per minute.

All the turbines are provided with surface condensers which are fitted with Wheeler Rotex air-and-condensate removal pumps. Condenser water is recirculated by sprays over a concrete basin 180 ft. long by 160 ft. wide, the spray equipment consisting of 162 nozzles.

The switching equipment is located in a switch room adjacent to the generating room. The switches are remote, manually controlled from the switchboard panels, which are placed in line with the main supporting columns of the building and serve as a wall between

the generating room and the switch room. Sufficient panels with their switching equipment are supplied for the control of the generators, auxiliaries and segregated feeders to the various circuits above and below ground.

The water supply for boiler use is one of the interesting features of this plant. Flowing streams or dependable reservoirs are unknown in this section of desert county, and the railroads and former mine operators soon learned that deep wells were the only source of water supply. The mine provides only a small quantity of water; in fact the mine pumps provide only enough water to supply the miners' wash house.

The single well which at present supplies the power plant is 2,882 ft. deep, and the log, as briefly recorded in Fig. 3, gives the size of the casing at various depths. Water was found at the 300-ft. and 1,250-ft. levels but not in sufficient quantities to insure an adequate supply. The water rises to within 100 ft. of the surface, and tests show the capacity of the well to be about 125 gallons per minute. This capacity will be greatly increased when perforated casing is installed at the 300-ft. and 1,250-ft. levels.

BOILER WATER RAISED FROM WELL BY AIR LIFT

An air lift is used for raising the water to the surface, a No. 4 Ingersoll-Rand footpiece being supplied with air from a 16-in. and a 7x10-in. compressor driven by a 100-hp. motor. Many of the difficulties encountered with the air lift have been overcome by the mining interests of the Southwest and all the experience gained by the Allied-Copper Co.'s installations were available for this work.

The water thus obtained (Table I) is pumped at much expense and every possible precaution is taken to prevent waste and to return to the system in the form of condensate as much of the generated steam as is possible. Compensation is made for the unavoidable losses of water in the boiler system by make-up water supplied from a water-purifying plant.

Ordinary methods of water treatment did not appear to meet conditions or to be adaptable to this water, especially as some of the impurities, notably the chlorides, were difficult to remove. In order to provide that

FIG. 6

Switchboard

This board has remote manually operated circuit breakers controlling the generator and feeder circuits. It will be noted that it has a dead front, all the wires being in the rear. The panels line up with the building columns and do not project into the main generating room.

TABLE I—ANALYSIS OF WATER OBTAINED
FROM 2,882 FT. WELL

	Grains per Gallon
Silica	0.736
Oxides of iron and aluminum.....	0.128
Carbonate of lime	7.618
Sulphate of lime	4.397
Carbonate of magnesia	3.822
Sodium and potassium sulphate.....	16.829
Sodium and potassium chlorides	0.850
Sodium and potassium nitrates	Trace
Loss, etc.	0.193
Total soluble mineral solids	34.573
Organic matter	Trace

Total soluble incrusting solids	16.701
Total soluble non-incrusting solids	17.872
Pounds soluble incrusting solids per 1,000 U. S. gallons	2.30
Pounds soluble non-incrusting solids per 1,000 U. S. gallons	2.55

the water would be pure and at the same time to prevent any waste of water and of heat an evaporator or system furnishing distilled water as "make-up" for the plant losses was installed. With this system all impurities are prevented from entering the boilers and all expense from scale, boiler blow and priming is eliminated.

The evaporator system is of the double-effect high-heat level type. High-pressure steam from the boilers enters the coils of the first-effect evaporators and in condensing, evaporates the water in the shell. The vapor thus formed passes to the second-effect evaporator coils and repeats this process. The vapor from the second-effect shell is condensed in a high-heat level condenser using boiler feed for circulating water. This also is the path of the bulk of the heat in the steam supplied to the evaporators, so this heat is not lost but returned to the boilers as increased feed temperature.

The drains from the evaporator coils and high-heat

level condenser are normally returned to the plant open heater, but can be pumped direct to the boiler-feed line if desired. The evaporator-feed water is heated in an open heater by exhaust steam from the plant auxiliaries to a temperature of 198 deg. F., which is nearly the boiling point at the altitude of Gallup (elevation, 6,750 ft.). This degases the water as soon as it enters the system, and as an extra precaution the contents of the plant open heater are held at nearly the boiling point by the hot-coil drains and the exhaust steam.

Griscom-Russell high-pressure submerged multicoil evaporators are used. There are two units per effect or a total of four evaporators. The coils of the evaporators are entirely submerged and are covered with an enveloping baffle in order to prevent the possibility of priming. The evaporators are entirely self-scaling. Scale is removed every eight hours. Just after the evaporator shells have been emptied and refilled with cold water, live steam is turned into the coils, and their resulting distortion cracks off the deposit of scale, which falls to the bottom of the shell and remains there during the eight hours, being blown out when the shell is emptied.

Each shell is provided with a float control to maintain automatically a constant and continuous blow sufficient to carry off the impurities in the water. This, however, can be changed to an intermittent blow-down if conditions should prove that to be more economical.

The relative location of the units comprising the evaporator system are shown in the power-house cross-section (Fig. 5). The evaporators are in the basement, the mixing tank and plant open heater on the boiler-room floor and the high-heat level condenser is located on a platform high enough so that the drains will return by gravity to the open heater.

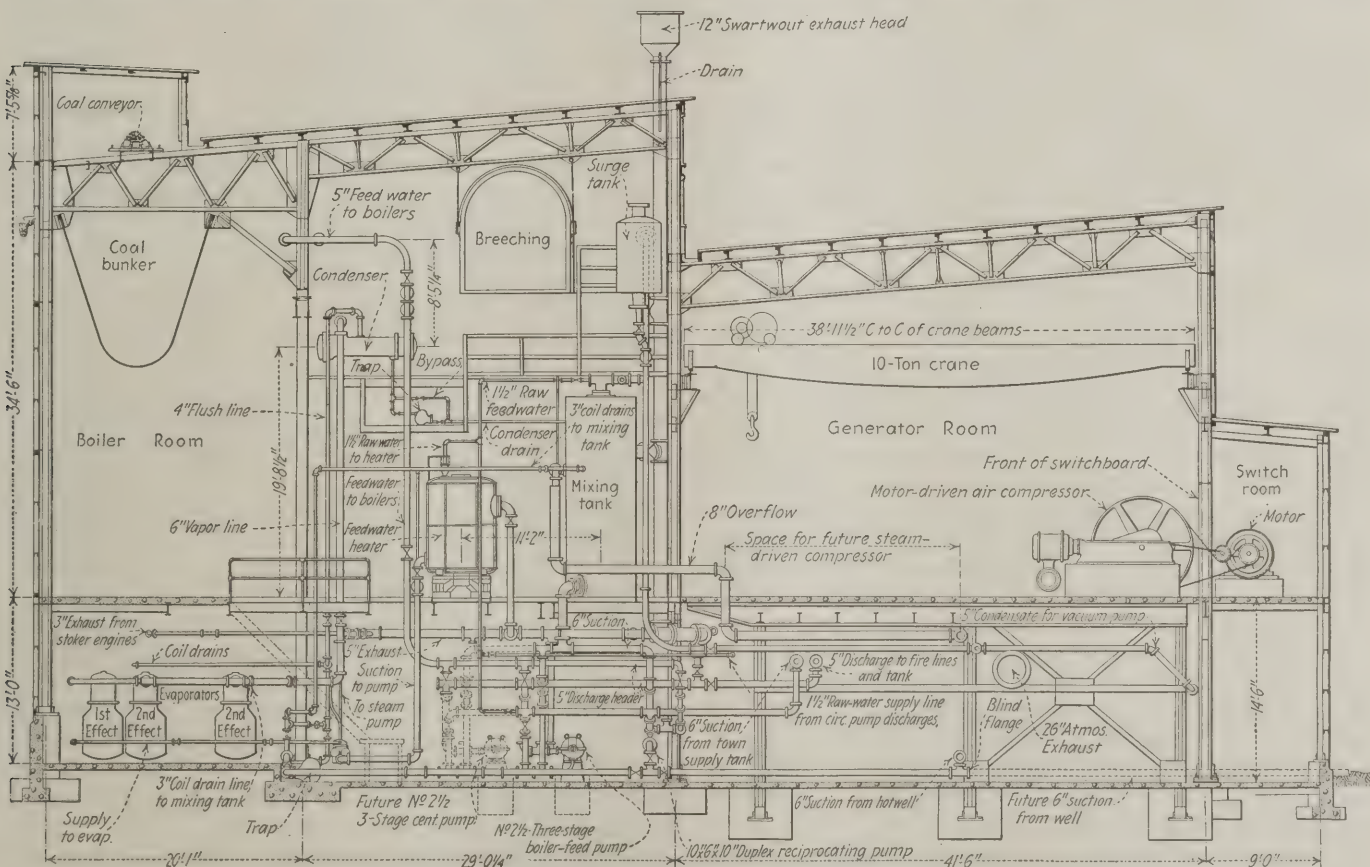

FIG. 5—CROSS-SECTION OF POWER HOUSE SHOWING EVAPORATOR SYSTEM

With only about 125 gallons per minute to draw on and that supply perhaps none too certain, every care had to be taken to economize in the use of water. For this reason it is used over and over again, but this has an advantage in that the water remains pure. Whereas others are continually purifying the water they use, the water at Navajo No. 5 is made pure once and for all and used repeatedly.

Revolutionizing Mine Pumping with Automatically Primed, Started and Controlled Centrifugal Pumps

Development of Automatic Equipment—Application of Simple Devices to Complex Operations—Advantages and Economies Realized—Details of Equipment and Operation

BY EDGAR GEALY

Electrical Engineer; Associate Editor, *Coal Age*

AUTOMATIC operation of simple devices is now quite common, but its application to complete operations of complex machines is still new. There was a time when it was considered highly desirable to depend upon the human factor in the operation of equipment, but gradually and slowly mechanical and electrical devices have been perfected to a degree which has proved them to be more reliable than the human element. Many of these simple devices are performing their duties with almost unquestionable exactness and regularity. Therefore the application of these simple automatic devices to complex operations is the real engineering pioneer work of today.

Many of the most arduous operations that must be done around the coal mines are now being done by the use of machinery. In the application of this machinery thought was not always given to the possibilities of automatic operation; in fact, many engineers and mine managers lost sight of the idea as greater safety and economies were being realized through the greater application of machinery.

No small number of simple protective devices have been developed and applied about the coal mines. The need has been apparent and their value and importance have been well established. The combination of these ideas has only recently made possible the automatic reclosing circuit breaker and the automatic converting substation. Now we have the automatic centrifugal pumping outfit, which no doubt will revolutionize mine pumping.

LARGE VOLUMES OF WATER PUMPED

One of the greatest of mining problems is pumping. Water must be handled and rehandled in almost every mine whether in operation or idle. In the bituminous-coal field it is asserted that an average of about two tons of water is pumped from the mines per ton of coal mined, while in the anthracite field the ratio is about eleven tons of water to each ton of coal; in some places the figure runs as high as fifty tons of water per ton of coal. Obviously the investment in pumping apparatus is large and the importance of the pumping station is great.

In the opinion of many mine engineers the centrifugal pump has become the logical pumping unit for most large pumping problems and its automatic operation is very desirable. Strange as it may seem the development of the first automatic centrifugal pumping outfit was due to the failing of the human element in non-automatic operation.

The idea of developing an automatic centrifugal pumping outfit was first suggested in May, 1922, by J. T. Jennings, power engineer for the Philadelphia & Reading Coal & Iron Co., with offices at Pottsville, Pa. Realizing the usual difficulties which go with the opera-

tion of centrifugal pumps, he decided to set out to devise some means by which the centrifugal pump could be primed and started automatically. Collaborating with him were B. M. Horter, of the Cutler-Hammer Manufacturing Co.; Guy V. Woody, of the Allis-Chalmers Manufacturing Co., and Otto Haentjens, of the Barrett, Haentjens Co., of Hazleton, Pa.

Prior to this date, certain devices had been developed for priming centrifugal pumps by means of a vacuum pump and a vacuum breaker to prevent the flooding of water into the vacuum pump. It was around this equipment that the automatic features were built. After some preliminary development of ideas and plans Mr. Jennings purchased certain electrical auxiliary apparatus, a vacuum pump and vacuum breaker and put into operation what later became the first automatically primed, started and protected centrifugal pump. The installation was at the Draper mines and was put in operation last June.

Since that date many automatic centrifugal pumping outfits have been laid out and ordered and some are already in operation. The success of these first outfits seems to indicate clearly the great need and keen desire for automatic pumping stations.

REASONS FOR AUTOMATIC PUMPING

It is interesting to trace the events which led up to the development and installation of this pumping station. The Philadelphia & Reading Coal & Iron Co. had recently decided to electrify its properties on a rather large scale, and was confronted with the problem of installing electrically driven plunger pumps or electrically driven centrifugal pumps to handle the large volume of water encountered in its mines.

The electrically driven centrifugal pump offered the ideal pumping unit for underground service, as it takes up little space, has a smaller initial cost and a lower operating cost.

For several years centrifugal pumps have been used as mine pumps in the anthracite field. The extended use of this type of pump, however, has been retarded by the seemingly inherent unreliability of the pump, which apparently is due to acidulous mine water acting on the vital parts of the pump in such a way as to destroy its efficiency in a relatively short time. This has resulted in high power costs, heavy repair bills and annoying shutdowns. The company had used centrifugal pumps as relay pumps since 1904, but had not considered this class of pump for its permanent plants.

Confronted with the problem of deciding between plunger pumps and centrifugal pumps, a comprehensive study was made of the several makes of centrifugal pumps and it was decided that the advancement made in designs justified the installation of a test plant of

FIG. 1—PUMP LAYOUT AND CONTROL WIRING

The complete equipment is shown here, including the priming pump and control panels. The wiring diagram shows the starting and operating circuits with protective devices.

sufficient capacity to eliminate entirely one of the steam pumping plants. It was therefore decided that this test pumping plant be located at the Draper Colliery, in the Mahanoy Valley about 12 miles from Pottsville.

The pumping plant as originally installed comprised two six-stage centrifugal pumps having a combined

capacity of 4,000 gal. per minute against a head of 650 ft., each pump driven by a 400-hp. 2,300-volt 900-r.p.m. slip-ring induction motor with automatic contactor control panel. When finally completed and put in operation the initial tests showed a pump efficiency of a little better than 75 per cent. For a few months this plant received close attention and no troubles whatever developed; but when close supervision was relaxed and the plant was placed under the sole care of the pumpmen, pump

troubles began to develop, causing stoppages of the pumps for repairs.

The Reading engineers became anxious over these stoppages and after a thorough investigation decided that many of the breakdowns were due in part at least to the operator's starting the pumps before they were properly primed and continuing the operation of the pumps after the sump was lowered. Realizing that any attempt to operate the pump not properly primed was disastrous to the pump, it was decided that to make a really successful centrifugal mine pumping plant, the several manual operations should be made automatic, thus eliminating the human element in the vital stages of operation.

A canvass of all the mining companies, however, disclosed the fact that no steps had been taken to make the operation of centrifugal pumps automatic; neither

FIG. 2—VACUUM BREAKING DEVICE

This device is the most important piece of equipment in the automatic apparatus. It protects the vacuum pump and controls the starting of the centrifugal pump.

FIG. 3—SOLENOID PRIMING VALVE

This valve allows the pump to be primed and closes when the pump is started and ready to pump. Its action is very positive due to the pressure created inside the pump during operation.

FIG. 4—FOUR-STAGE PUMP AND CONTROL

This pump is made up of two separable units; each unit is shown with its automatic priming valve. The vacuum breaker and float switch appear between the pressure and vacuum gauges.

had any of the pump manufacturers anything to offer.

Guided by the desire to provide only the essential protection and operating features with a minimum of equipment, Mr. Jennings decided that the following conditions had to be met:

- (1) Starting and priming the centrifugal pump when the water in the sump reached a predetermined high level.
- (2) Protection against starting the centrifugal pump unless fully primed.
- (3) When the pump is properly primed, the motor is started and the pump brought up to speed.
- (4) Stopping the priming pump when the centrifugal pump is up to speed.
- (5) Running the centrifugal pump through its protective devices.
- (6) Stopping the centrifugal pump when the water in the sump recedes to a predetermined low level.
- (7) Protection against running the centrifugal pump if it loses its water or if the column breaks.

With these points in view, development was carried on until the automatic pumping outfit took its present form, and additional plants have been installed by this company at the Kohinoor and Boston Run Collieries.

Fig. 1 shows the general layout and arrangement of the complete priming, pumping and control equipment. The cycle of operation is as follows:

When the sump was filled to a predetermined height, at which the pumping should start, the float closes switch 1, thereby closing circuit A, thus energizing the solenoid valves and closing priming pump switch 3. The solenoids open the priming valves and the priming pump 4 begins to run, drawing air out of the suction pipe and pump casings, through the priming piping, and into the vacuum breaker 5. The pump is thus primed by the water taken up from the sump.

Fig. 2 shows the vacuum breaker. Float 1a rises and closes switch 6, thereby closing circuit B, thus closing the centrifugal pump motor switch 7 and starting the centrifugal pump. As soon as the pump begins to run, water is forced through the priming valves 2 into the priming piping and vacuum breaker, causing float 1a (Fig. 2) to rise further and open the air valve, 2a. Air now enters the vacuum breaker, breaks the vacuum and the water drains out through the check valve 10, float 1a falls and opens switch 6.

The centrifugal pump motor would now stop if the shunt around the switch were not provided. This shunt

circuit contains a normally closed vacuum regulator, 9, and a normally open pressure regulator, 8. The pressure regulator is connected to the first or any other stage of the centrifugal pump and closes when the pressure approximates the normal pressure developed in the stage to which it is connected. This takes place soon after the motor is up to full speed. The vacuum breaker is so arranged that switch 6 is kept closed until this pressure regulator has closed, so that when switch 6 opens, the current passes through the vacuum regulator and pressure regulator which now controls the starter 7, as will be explained later.

In circuit A, contactor C is connected. This contactor opens and de-energizes the priming valve solenoids and opens switch 3, stopping the priming pump as soon as the centrifugal pump motor is up to speed. This contactor is actuated through a device on the motor shaft which opens when the motor is up to speed. When the centrifugal pump stops, contactor C again closes and the priming pump will start again providing the float switch, 1, is closed. This constitutes the starting operation.

The wiring diagram of Fig. 1 shows that by means of circuit B the motor-control circuit is such that the centrifugal pump will come to a stop when one of the regulators opens. The vacuum regulator, 9, is set for a degree of vacuum depending upon local conditions. If the vacuum regulator is used for stopping the pump when the sump is pumped down, the amount of vacuum is equal to the distance from low-water level to the connecting point of the regulator piping to the suction line. This is done when the sump extends over a large area necessitating a long, sloping suction line. If the sump can be arranged as shown in Fig. 1, which is the ideal arrangement, then a 2-pole sump switch can be used for stopping. In the latter case the vacuum regulator is set for a slightly higher value and acts only when the suction increases unduly, due to a blocked strainer.

The pressure regulator opens when the pressure fails. This may be caused when the inflow of water is restricted, due to a blocked strainer, a broken column line, or when air enters the pump through leaky joints in the suction line or through the stuffing box on the suction side of the pump. A small amount of air reduces the capacity of a centrifugal pump, because water entering the first impeller creates a mixture of expanded air and water. The air is compressed after passing through the first stage and therefore its presence is more easily detected in the first stage than in the fol-

FIG. 5—MODERN PUMPING STATION AT KOHINOOR COLLIERY

This is how the latest type of mine pumping station looks. This station is fully equipped with automatic starting and control apparatus for both the pump and motor.

lowing stages. The pressure regulator should, therefore, be connected to the first stage. Actually it is taken off the priming valve connection to the pump.

From the above it obviously is necessary that one priming valve must be connected to the first stage, because if the first stage is not completely freed of air, the pump will not start. It is usual on this type of pump to provide one priming valve for two stage pumps, two valves for four stage pumps, three valves for six and more stages. The vacuum and pressure regulators are standard Cutler-Hammer equipment. The priming pump and vacuum breaker were originally designed for manual operation by the Barrett-Haentjens Co., of Hazleton, Pa., and were fully described in the March 30 issue of *Coal Age* in 1922.

For automatic operation the vacuum breaker has been slightly altered and is shown in Fig. 2. The water does not flow directly into the vacuum breaker housing but enters through a riser, the foot of which is pierced by a hole 3a. The riser serves a double purpose. The water when entering is mixed with air and is therefore turbulent; and this would cause a jerky operation of the float. By coming out over the riser the air now goes directly to the vacuum pump and the water falls into the pocket, raising the float gently. The float, through lever 5a, closes first the switch and then opens air valve 2a, whereupon the water falls rapidly from the inlet side of the riser but slowly from the chamber, thus delaying the opening of switch 4a, which must be kept closed until the centrifugal pump is well under way and has established the normal running pressure required to close the pressure regulator. Switch 4a can be of the 2-pole type and would then stop the priming pump and de-energize the solenoids the instant the centrifugal pump starts up.

Should switch 4a fail, water cannot be drawn into

FIG. 6—DRAPER PUMPING PLANT, THE FIRST AUTOMATIC MINE PUMPING STATION

Due to the location and moisture the control and feeder wires in this station are run in conduits suspended from the roof. The vacuum priming pumps are shown on the left.

the priming pump, as air will enter through valve 2a, breaking the vacuum. Should the priming valves stay open after the centrifugal pump has started and discharged more water into the priming piping than check valve 10 can pass, check-valve 5a will finally come to its seat and prevent water from entering the priming pump.

The solenoid priming valves were especially designed for mine service, being made of cast acid-resisting bronze and having no small bolts. The valve as shown in Fig. 3 is open; the solenoid when energized pulls stem 1b to the right until crosshead 2b touches washer

3b. The solenoid remains energized as long as the priming pump runs. The pull of the solenoid is supplemented by the atmospheric pressure, which tends to push stem 1a to the right when there is a vacuum within the valve body. Preferably the valve is mounted directly on the pump casing. The air passes through small holes in the stem, as shown. The area of these holes is ample for air, but when the centrifugal pump starts up, water under pressure enters and cannot escape quickly enough through the small holes so that an excess pressure is built

up on the right-hand side, which pushes the stem to the left until the leather-faced part of the stem touches seat 4b. This makes a tight joint, which can also easily be renewed. The closing force therefore is great. A 1-in. valve has a 2½-in. plunger, so that the valve on the first stage is pushed closed with a pressure of several hundred pounds, depending on the pressure developed by the first stage. The valve, however, closes slowly as the pressure builds up, but is held closed with the full pressure and therefore stays tight.

When closed, the valve cannot open until the solenoid is energized. This is important when one priming pump serves a number of centrifugal pumps. Only the pump whose solenoids are energized is primed. The other valves of the other pumps, due to the vacuum in the priming piping, are pulled tight to their seats. One priming pump can serve a number of centrifugal pumps, but each centrifugal pump must have its individual sump float switch, vacuum breaker and regulators.

An interesting feature in connection with this equipment is that in case of any trouble the priming pump will operate to prime the centrifugal pump four times before shutting down and then locking out. This arrangement insures the starting of the pump in the event of some slight irregularity. Arrangement can be made for a bell alarm whenever the station is thus locked out.

The automatic pumping equipment performs many functions besides automatic priming and starting, although they are the major features. A complete outfit will prime and start the pump when the water in the sump reaches a predetermined height and stop the pump when the sump has been pumped down to a set level.

FIG. 7—WATER LEVEL INDICATOR

This indicator gives a visual indication of the amount of water in the sump. Control equipment on this indicator starts and stops the automatic pumping. Note the strainer with removable cover shown at the right of the picture.

Should the suction line become blocked, the pump shuts down. If the suction line or pump leak air, the pump shuts down. When the column line breaks or has an excessive leak, the pump shuts down; this is highly desirable when the pump has a column line which would cause the water coming out of the break to run back into the pump room, where it probably would drown the pump out. It also is impossible for the pump to operate unless all conditions are such that the pump would operate satisfactorily. Improper priming and operation of centrifugal pump have been a real source of danger and expense. Frequently pumps have been wrecked and lost due to not being properly primed before starting or due to losing its water during operation.

There are several additional operating and economic advantages obtained with automatic pumping equipment. Pump runners often do not know to what level water in the sump should be pumped out and frequently the pumproom layout is such that they do not know the level of the water in the sump unless they go to some trouble to find out. The result is that the water in the sump is sometimes pumped so low that the pump rattles, causing excessive strains. At other times the sump may be allowed to fill up to an unsafe level. Both of these conditions are made almost impossible with the automatic features of operation.

Remote control of the pumping also is made possible. Frequently pumps must be placed in inconvenient places in order that the suction line can be made as short as

FIG. 8—COMPLETE EQUIPMENT FOR AUTOMATIC PUMPING STATION

possible, yet it usually is undesirable to place the control equipment where the pump is located. In this event it is entirely feasible to place most of the control and priming equipment in a higher and safer position where inspections and repairs can be accomplished under better conditions.

Cost for pump operators also has been an important item to the coal manager and especially is this true in the event of a temporary idleness of the mine, when it is desirable to keep fixed charges as low as possible. In the event of suspension, strike or shortage of labor, automatic pumping equipment makes possible the operation of a large number of pumps with only a small amount of occasional inspection. With automatic equipment one mechanic can keep a large number of pumps in perfect operating condition.

Seizure of Ruhr Mines May Bring About Crisis in French Fuel Supply

Business men are skeptical as to the outcome of the action of the French Government on July 29 in seizing cokeries and mines in the Ruhr for direct operation, says a cable to the Department of Commerce at Washington from Chester Lloyd, commercial attaché at Paris. Apprehension lest the supply of fuel from the Ruhr cease is increasing, and Strasbourg business interests are asking for the establishment of an emergency winter coal stock of 500,000 metric tons, complaining that little coal has been received from the Ruhr and that a coal crisis similar to that of 1920 threatens the district.

Basil Miles, Administrative Commissioner for the United States of the International Chamber of Commerce at Paris, in a report says that France is getting only about one-third as much coal and coke out of the Ruhr as she previously got from the regular reparations deliveries. The Ruhr, he says, may be regarded in many aspects as an industrial district on strike as the result of German passive resistance. Mr. Miles reviews economic results of the occupation and says that wherever the Germans refused co-operation the French proceeded without it and at the same time retaliated by measures established under martial law. Where the Germans refused to mine coal and make coke for the French, the French replied that they would not be allowed to make it for themselves, and an embargo was placed on the exportation of coal and coke, and on products of the metallurgical industry into unoccupied Germany.

As the German Government has refused to continue coal and coke deliveries since the occupation, the French are systematically seizing accumulated stocks, taking one mine or factory at a time. Practically every time they do so the workmen concerned strike and refuse to continue production for French consumption. Contrary to expectations, theoretically there is no unemployment in the Ruhr. Workmen are overhauling factories and opening new veins of coal, non-productive work which will be useful in the future.

With six months freedom from allied control, Mr. Miles says, the Ruhr probably could produce more coal than ever before; certainly within a year its present capacity could be organized to a production much in excess of any pre-war year. Mr. Miles says that the idea that the French themselves can produce Ruhr coal, coke and steel without German labor and management is fantastic.

The coal and coke so far removed from the Ruhr, according to advices from the Berlin correspondent of *Coal Age*, consists solely of the reserves accumulated during the earlier months of the occupation. Nothing has been added to them since the middle of April. The critical stage will be reached in September or October, when these reserves are exhausted with no new supply forthcoming. Allied shipments in July dropped to about 5,000 tons of coal and 1,300 tons of coke per day, according to German observations. While at first only coke and high-grade coking coal were seized, coal of inferior quality is now being taken. The reserves in existence at the end of July were estimated at 1,000,000 tons, a large part of which is stored in localities difficult of access and consists in part of lean, soft grades unsuitable for coking.

Present Practice in the Design and Sinking of Shafts*

Ground Water Adequately Protects Most Timbered Shafts, and Preserves Them Also—Concrete Both Scales and Pockmarks—Should We Use Vitrified Brick?—Buntions of Concrete Not Resilient—Shall We Grout or Drain Shaft?

BY R. G. JOHNSON†
Pittsburgh, Pa.

FIFTEEN years ago, only where the coal was less than 100 ft. below the surface did mining engineers think a slope the more desirable way of reaching it. In those days either a chain or rope hoist was used for moving the cars. Today rubber-belt and steel-apron conveyors are installed in slopes, and in consequence many prefer to drive a slope even when coal is found as much as 200 ft. below the surface.

The width of a shaft can be determined by the length of the car, always, however, making the width in excess of that length from bumper to bumper, to prevent the link from hitting the shaft lining when the cage is being hoisted or lowered. At least 4 in. of clearance should be allowed at the ends of the cages to provide for any irregularity in the concrete lining and for the possible accumulation of ice. Unfortunately, the hoist compartments must be either neutral or downcast, and for this reason they are cold in winter and likely to be filled with frozen water. In fixing the distance between the faces of the guides on which the cages slide the cagemaker's dimensions should govern. An allowance of about $\frac{3}{8}$ in. for play should be made on each shoe of the cage.

In 1903 at South Brownsville, Pa., two shafts were sunk as concrete caissons, this method being made necessary by the fact that there, as well as on both sides of the Monongahela River in many of the stretches just above Brownsville, river silt overlies the rock. After sealing the caissons in the rock the shafts had to be sunk about 45 ft. to the coal, and this length was lined with concrete in place of the usual timber-set lining. These, as far as I can find, were the first shafts lined with concrete throughout. In 1903 at Gary, W. Va., two deeper shafts were constructed, elliptical in shape and lined entirely with concrete. Engineers generally were slow in accepting this new method of lining, but as time went on the value of the new designs impressed themselves on mining engineers, and today most of the new shafts are concrete-lined, and many that formerly were timbered have been lined with concrete when relining became necessary.

Though concrete provides a stronger lining, standard 8x10-in. timbers on 5-ft. centers with 2-in. lagging provide a lining amply stout, and with water rings which are catchbasins around the shaft just behind the lining and proper draining a timbered shaft can be made as dry as a concrete shaft. The question really resolves itself into a comparison of first and ultimate costs. The life of a first-class lining of white oak or long-leaf yellow pine, if the shaft is dry, will be from twelve to twenty years. If the shaft is wet, with water constantly dripping over the timbers, its life with minor repairs is almost unlimited.

If the field of coal being worked is so small as to

give a life of twenty years or less, timbered shafts in most sections of the country will be cheaper than concrete even in the long run because the moisture that is found soaking into the timbers in most timbered shafts, especially around Pittsburgh, provides a good fire protection and acts effectively as a wood preservative. Only in exceptionally dry shafts is a timber lining dangerous. The timbers in some of the later installations have been treated with wood preservatives, but this is not advisable, for it would prove a splendid fuel for a fire. Because of the fire risk, timber linings are not permitted in new shafts by the state laws of Illinois.

After twenty years of watching developments in the design and construction of concrete-lined shafts, I am not sure they are entirely satisfactory. A large number of the downcast shafts which are lined with concrete are pockmarked. The lining is slowly scaling and disintegrating. Moisture or rain or dripping shaft water is sucked down with the incoming air and, of course, wets the surface of the lining. The concrete naturally absorbs some water and alternation of freezing and thawing eats into the lining, causing it to peel scale by scale. I am convinced that we must find a suitable waterproofing for downcast concrete-lined shafts, or we shall have to provide a veneer of some impervious nature. I believe vitrified brick would make an effective veneer, the brick to be laid in cement and locked every four or five courses to the concrete lining with a row of headers.

Of course, in constructing a plain concrete lining, it is possible with very careful puddling while the concrete is being placed to remove most of the small air bubbles, and in some linings waterproofing compounds have been used, but the success of these waterproofings has been rather indifferent. This trouble with linings is today the most serious problem in shaft construction, closely akin as it is to the handling of the water through the lining.

A New York waterproofing concern has proposed a method of treatment for a shaft lining in the Pitts-

FIG. 1—VARIOUS TYPES OF SHAFT BUNTIONS

A buntion should give a little when bumped or it will tend to break. If made of steel and shaped so as to collect water it will rust away rapidly unless the receptacle thus created is filled with concrete. It is well so to arrange the buntion that it can be removed without injury to the walls.

*Abstract of paper read before the Engineers' Society of Western Pennsylvania; from *Proceedings*, May, 1923, p. 134.

†President, R. G. Johnston Co.

FIG. 2—METHODS OF SPLICING AND HOLDING GUIDES

The simplest and best of splices is the butt splice. The bolts should be countersunk into the guides so that the bolt heads will be at least a quarter of an inch below the exposed face.

burgh region which has scaled and become pockmarked by the action of water and ice, and the work, which I understand will start this spring, will certainly be watched with interest.

In England, France and Germany brick is used for most of the deep shafts that are masonry-lined, but engineers in this country have never strongly inclined toward either brick or concrete block. In a flat-sided shaft, brick or block will not give the desired strength where the strata are soft. Concrete fulfills all requirements of strength and will stand the unusually severe strains produced by the blasting which the sinking process makes necessary.

Pipes, drains, and buntion and guide connections can be placed in the lining as it is being constructed. The concrete should be mixed in the proportion of 1:2:4. It should be from 12 to 18 in. thick. Provision always is made, however, that points of solid rock may project within 4 or 6 in. of the concrete form. This unquestionably adds to the support of the shaft lining.

Concrete, then, will be the medium for the lining of the shafts we are designing, a vitrified veneer being used for the downcast compartment, which will be separated from the hoistways by vitrified-brick walls laid in panels on the buntions.

The function of the buntions in a concrete shaft is principally to hold the guides in position. Their strength is seldom calculated with the idea that they have to support or brace the lining except near the top of the shaft, where they help to prevent the bulging of the loose earth. This does not conform to the ideas of some designers, but experience has surely proved that the rock measures have no lateral movement when they are practically horizontal. Use has been made of many different sections of buntions. The material of which they are made may be wood, steel, or combinations of steel and concrete. With timber-set lining the buntion is a necessary part of the framework.

Timber buntions and steel buntions have resilience to absorb and dissipate the strain imparted to them through the guides by a fast-moving cage or skip, but the only reinforced-concrete buntions I have ever seen were full of small cracks, caused, I assume, by vibration. The steel H-beam makes an ideal buntion for a concrete shaft. It should be placed on edge and the top concavity filled with concrete to prevent water from settling therein, but the steel buntion is not readily replaced in case of a wreck of the shaft, and many designers in the last few years have used the timber buntion either concreted in place or set in hitches left in the lining or else a timber buntion which is bolted to short sections of I-beam or inverted channel concreted in.

The various types are shown in Fig. 1. The principal objection to steel is its susceptibility to corrosion in

the combination of mine air and mine-water drippings, and, though it easily can be painted outside the shaft, nothing entirely effective can be done in the shaft on account of the dampness. The best paint for mine buntions is a homemade mixture of coal tar, portland cement and kerosene applied hot to the clean steel.

I know of one case where the buntions were painted with this combination ten years ago, yet recent investigation showed them to be in fine condition. Many believe steel buntions are best, but, being concreted in, they cannot be quickly replaced, and many engineers incline toward the timber buntion bolted to short steel I-beams concreted in the lining. Where a masonry partition wall is built in the shaft, steel buntions, are, of course, best.

Guides for the cages are practically always of timber, a prime grade of long-leaf yellow pine being the most desirable. Steel has been tried, but I know of no successful safety device that will work on steel guides to guard the cage from falling in case of accident. Set accurately to plumb-line and gage, the guides are dapped over the buntions and bolted to them. There are several methods of splicing the guides, and the simplest and best of these is undoubtedly the butt splice. All bolts are countersunk into the guides, and the heads of the bolts should be set in at least $\frac{1}{4}$ in. deeper than the face of the guides (see Fig. 2).

Partitions in timbered shafts are of yellow-pine tongued-and-grooved sheeting either of two layers of 1-in. tongued-and-grooved material spiked with loose joints to the buntions, or of one layer of $1\frac{1}{2}$ -in. tongued-and-grooved sheeting. Partition walls, or curtain walls, as they are often called, in concrete-lined shafts are nearly always of reinforced concrete, and though some have been constructed as a continuous solid concrete wall from top to bottom, a thinner and stronger wall can be constructed on steel buntions placed at intervals of 5 or 6 ft. in the shaft.

ADVOCATES VITRIFIED BRICK FOR SHAFT WALLS

The walls usually are reinforced, and a typical design is shown in Fig. 3, but some of the concrete walls in downcast shafts have peeled and are constantly scaling. I believe that they too should be made of vitrified brick. The light reinforcement that is now used in concrete walls can be used just as well in the brick wall. Laid in cement mortar with thin joints, they should serve their purpose well.

I favor vitrified brick simply because it is the best medium that I know which presents an impervious face. If we can find a waterproof paint that can be applied so that it will be absorbed into the pores of the face of the concrete or a waterproof plaster that will cling to the lining and will stand the test of time in its resistance to the water, our problem is solved, and concrete so treated will be ideal.

The method of handling water which is encountered in the sinking depends largely upon the quantity of water and the nature of the rock. Grouting is the only method of preventing the water from coming into the shaft, and today provision for the sealing of water by injecting cement into the fissures of the water-bearing strata is a part of all specifications.

Today all prices in contracts for sinking shafts are based on the assumption that if water is encountered it will be kept back by grouting and the work paid for according to provisions made in the contract. Grouting usually is paid for per barrel of cement

injected, but it would seem that a method fairer to both parties would be an agreement to pay for the cost of grouting on a basis of cost plus a fee per barrel, the fee to include the use of the contractor's plant and his profit.

The grouting clause and its price today takes the place of the water clause in the contracts of twelve and fifteen years ago. This clause in former contracts provided for additional prices per vertical foot sunk in case certain quantities of water were struck, the prices to increase as the quantity augmented, but this was an inequitable manner of paying for the cost. On one job I saw the contractor lose everything he had because he could not get below the water, the rock being blocky and full of fissures, so that he could make no footage at all in sinking and consequently could earn no premium to pay for the cost of his constant pumping.

On another job a contractor was able to construct a water ring just below the water stratum, which was reasonably close to the top of the shaft, and, placing his pumping plant at this ring, he pumped on, the pumping having no effect on his sinking, which was practically dry. According to the water clause, he was paid, of course, by the foot sunk for the additional water, and he sunk well and his coffers were filled with gold, and there was joy in the house of the contractor.

The fairest water clause for pumping is the one based on paying by the million-foot-gallons for all water pumped. This form of water clause (in addition to the clause for grouting) was used in the contracts for the shafts and tunnels for the Catskill aqueduct, which was completed several years ago. A typical water ring is shown in Fig. 4.

HIGH-PRESSURE GROUTING IN SOLID ROCK

The pressure used in grouting varies greatly according to conditions. If you are grouting in solid rock, the higher the pressure the more efficient will be the grouting. Usually with a grout tank you will use up to 125 lb. pressure. If you are using a pump, the pressure available is limited, of course, by the steam pressure and the ratio of the cylinders on the pump. In several cases on the Catskill aqueduct grouting was done under pressures as high as 500 lb., and my recollection is that in one or two cases a pressure of 600 lb. was used through the use of special equipment. Little high-pressure work is done in this section.

In grouting behind a shaft lining special care must be taken to gage the pressure properly, and definite results can never be guaranteed. If the holes to be grouted are in a round shaft, or in the round ends of a long shaft, they will, of course, stand more air pressure than in the flat side of a shaft, but it is practically impossible to force grout behind a lining with less than 20 lb. of air, and the possibilities of breaking a flat lining under even 20 lb. of air are great.

When grouting behind linings was first started, pans or blisters of tin usually were put against the rock rib where the water ran out when the lining was being poured, and a hole was punched in the tin from which a pipe led to the concrete lining form, and the grout was forced through this pipe. This is still done in many cases, but if it is possible to drive a pipe into the water-bearing crevice and calk the rock seam so that all water will lead into the pipe, a much better grouting job can be done, for higher pressures can be used, as there is not the area of lining over which the pressure of the grout can act.

The most successful grouting job in mine-shaft sinking was done near Welch, W. Va., on the Tug River. Here a shaft that had been sunk for ten years was still making 750 gal. of water per minute. When the mine changed hands improvements were planned and it was proposed that the shaft be lined with concrete, the lining to be designed so as to withstand pressure sufficient to grout the flow of water. We designed a heavy reinforced lining and used an unusually heavy H-beam section for the buntons, which were figured as struts.

Back of the lining we placed corrugated iron, and canvas back of this, our idea being that when the grout was forced behind the lining it would fill the pores of the canvas and absolutely insure a watertight job. When the grouting was finished, the shaft made, as nearly as we could figure, one quart of water per minute. I may add that the success of this job is

FIG. 3—SHAFT CURTAIN WALL

Illustration shows buntons with concrete in panels, a butt guide splice and the connection between the buntons and guides.

extremely unusual. Many equally heavy streams are encountered nowadays, but they are grouted in the sinking, and the necessity for heavy linings is avoided.

Grouting in slopes is more difficult. As the strata usually are horizontal, the grout injected into the crevices must travel over a large area to be effective. In water-bearing country it is wise to keep a test hole ahead pointed downward at a greater angle than the angle of the slope. If water is struck, more holes are drilled and grouted to refusal, but in driving a slope through a horizontal water-bearing crevice it requires a long horizontal distance to get beyond the drainage area of that crevice. In consequence the sealing of water from a single crevice often requires several grouting operations. Each operation requires not only the time for the injecting of the grout but a longer time to allow it to set before again shooting the face.

With the coal operator who is not familiar with the process of grouting the question of cost naturally arises

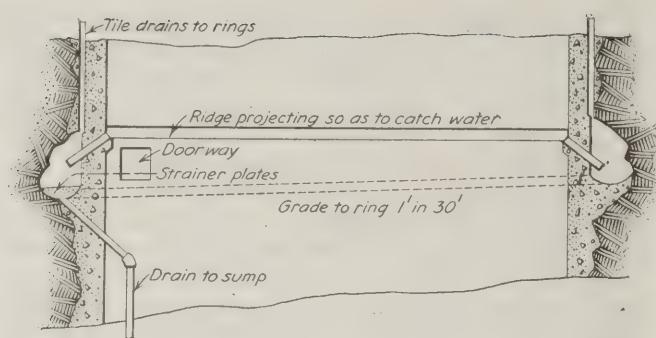

FIG. 4—TYPICAL RING IN CONCRETE-LINED SHAFTS

What little water is permitted to escape into a grouted shaft is caught by a protecting ridge and carried back to a shaft ring through pipes. This ring collects the water to a low point and is drained by a pipe to the sump.

when letting a contract. He is, of course, anxious to cut down the cost of his pumping, and any process or device which will save him dollars is interesting. Let us take a typical case. Assume the shaft to be 400 ft. deep and a stream of 200 gal. per minute encountered in the sinking. If this stream is not sealed the operator will have to pump it throughout the life of the mine. If his power averages 1c. per kilowatt-hour, it will cost him about \$3,000 a year. On a 15-per-cent basis it will be found that he could afford to spend \$20,000 to seal off the water.

Though the rock in different sections of the country largely determines the grouting conditions, and hence the expense of grouting, the average cost of sealing off this quantity of water would run over \$3,000 or \$4,000. I have been connected with jobs on which the total cost of grouting streams far in excess of 200 gal. per minute was not over \$2,000, and I know of no work on which a stream of this quantity has cost more than \$5,000. The operator could thus pay for his grouting in a year and save \$3,000 or \$4,000 a year afterward.

Some engineers believe that in the development of the mine the same water may be caught that has been sealed from the shafts. There are cases where I believe this is possible, and if the stream is directly above the coal I can appreciate that the engineer might hesitate to instruct the contractor to grout the fissures, although the absence of such a stream in the shaft, even though it should come out later in the mine, would be of much advantage to the shaft bottom.

If the water is above a substantial streak of fireclay or a thin bed of coal above the one being worked, I do not believe there is much likelihood that water will penetrate the strata above the coal and flow into the mine; at least until the pillars are drawn and the roof measures have sagged or fallen. Water usually flows in underground streams rather than lying in huge pools. It is seldom possible to pump dry a stream encountered in sinking. I am familiar with only one case where this was possible.

I have not discussed airshafts as such, for the general details are, of course, the same as in hoisting shafts. Stairs, if such are installed, are either of steel or wood. Steel makes the cleanest looking and strongest job, but a steel stairway is exceedingly difficult to paint effectively in the shaft. Yet of all details a stairway from a mine should be fireproof.

For lining purposes the contractor will carry 40 or 50 vertical feet of concrete forms, which usually are made in sections. When it is decided to concrete, the

muck is leveled off in the bottom of the shaft and sections of forms, designed according to the plan of the shaft and usually 5 or 6 ft. in height, are bolted together to make a complete ring. The buntion ends or buntions are placed in notches set in the forms, and the space between the rock rib and the form is filled with concrete.

This process is repeated until the stretch of concrete is joined to the old concrete above. As soon as the stretch of concrete is completed, the muck in the bottom of the shaft is taken out and the concrete forms are removed, and the process of sinking is again resumed. That blasting so soon after concrete is placed does not shatter the concrete seems remarkable, but I have never seen cracks from this cause.

No discussion of shaft design and sinking can be closed without saying a few words as to slopes, for in the last few years and at the present time they are being favorably considered for coal under 200 ft. in depth both for haulage and for manways. Conveyors both of the rubber-belt and steel-apron type have been successful in moving big tonnages at a low cost. For rubber belts a slope with a maximum of 33 deg. has been used, but I have heard users of the 30-deg. slope say that they are too steep.

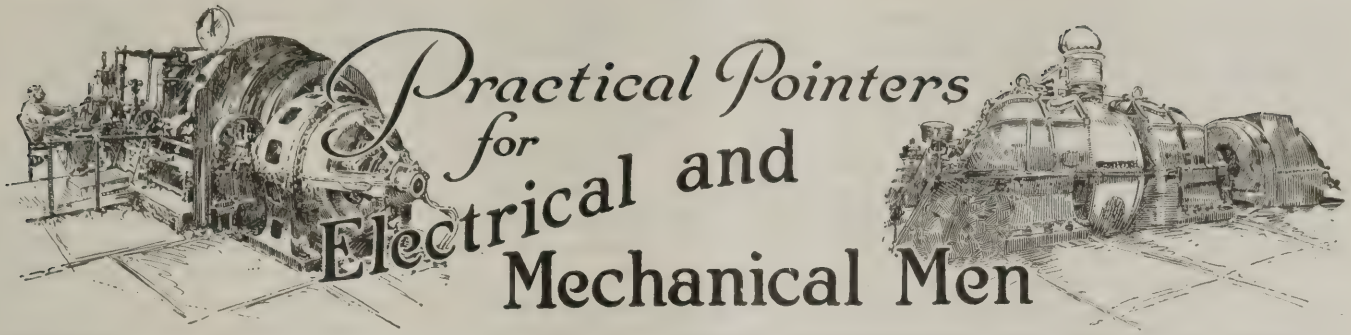

Slopes for manways and supplies usually are sunk on a 25-per-cent gradient. Slope linings of concrete depend upon the span of the roof for their design. Openings over 15 or 16 ft. wide are expensive to construct in localities where there is soft rock or an unusual depth of earth over the rock. Any slope is difficult to sink in soft earth and, as has been noted, is extravagantly expensive in running ground. In ordinary earth it costs about twice as much per lineal foot to sink as in solid rock because the earth is more difficult to remove than blasted rock, and timbering with sets closely spaced is required to prevent the roof and sides from caving.

In order to overcome the difficult construction of a wide slope in localities where there is excessive earth or soft rock, two companies in the Pittsburgh field have constructed double-deck slopes. Though expensive to build, one such slope is cheaper than two slopes having the same capacity or than one slope of the same area with the compartments side by side. Practically all concrete-lined slopes today have arched roofs from 12 to 18 in. thick. The thickness of the side walls should be 12 to 15 in. Arched slopes are naturally the strongest and do not as a rule require reinforcement. The additional area afforded by the arched roof always is to be desired for ventilation and headroom.

What Next?

Troutville, a mining town in Clearfield County, Pennsylvania, it is reported, is destined to become as famous for ice mining as it once was as a coal-producing center. With the discovery of a second "ice mine" reported in the state on a farm near the town, this form of mining is expected soon to assume the proportions of an industry. This natural refrigerating plant is in an abandoned coal pit on the farm of G. N. Rishell.

Cold air seeping in during the winter cools the rocks to a temperature far below the freezing point, but no ice forms because the air is too dry. In summer, however, the whole shaft becomes moist and when coal was being mined there recently miners had to remove two to three car loads of ice every morning before they could get at their work. This caused the shaft to be abandoned as a coal mine, thus opening the way for a brand new industry.

Protecting Attachment Screws When Severe Arc Goes Up the Horns

SOME time ago I noticed in one of your issues a suggestion for preventing the attachment screws from burning when the fuse of a horn-gap fused switch opened a circuit under heavy load.

I recently tried out this idea with success. On the switch that I tried this method of attaching the fuse, we had a heavy ground last month and the arc that went up the horns when the fuse blew was most severe.

DOUBLE FUSE EXCEPT AT MIDDLE
The fuse is caused to rupture in the middle by doubling the fuse wire where it goes around the horn and is attached to the screws.

On a horn-gap fused switch which I recently fused, I doubled the fuse wire except at that part between the two horns where the fuse should open. Doubling the fuse wire in this manner, I believe, will cause the wire positively to melt between the horns instead of back by the screws, which sometimes is the case, especially if the fuse wire becomes nicked in attaching to the fuse switch.

Considerations in Laying Out a Belt Drive

A BELT drive is used to carry a certain amount of power from one revolving pulley to another. Sometimes there is an additional purpose and that is to reverse the direction of rotation. However, the first problem that confronts the belt user is to determine the kind and size of belt to use in order to obtain the most desirable results.

The amount of power transmitted will depend on several factors, among which are the velocity at which the belt travels, the tension under which it is placed on the pulley and the arc of contact which the belt has with both pulleys.

Several different types of belts are obtainable, all of which have considerable merit under certain conditions. Some are more adaptable to certain conditions than others, and therefore considerable care should be exercised in making the proper choice. In order to

make an intelligent decision on any belting problem certain essential facts must be considered.

In many cases it is advisable to supply the manufacturers from whom belting is purchased with complete details and allow them to advise from their viewpoint of greater and more practical experience. For this purpose the following information should be given in order that a thoroughly accurate decision may be made:

(1) Horsepower to be transmitted: (a) average; (b) least; (c) most. (2) Diameter of driving pulley. (3) Diameter of driven pulley. (4) Number of revolutions per minute made by one of them; state which one. (5) Distance between pulley centers. (6) Whether drive is vertical or horizontal. (7) Whether the tight side runs on top or underneath. (8) Operating conditions such as dampness, fumes, flying grit, changes from light to heavy loads; high speed over small pulleys; running at $\frac{1}{4}$ twist; use of idlers, mule pulleys and stepped or flanged pulleys.

Certain types and sizes of belts have been proved thoroughly satisfactory and are known to be standard for many uses. Therefore it often is possible for men familiar with belting problems to state accurately what is the proper belt to use based on requirements of horsepower, uses, size of pulley and working conditions. Sometimes it is found that differences of opinion exist among manufacturers. In many cases this is due to the possibility of interchange of types. The best guide as to the type of belt to be used, however, will be founded upon a knowledge of good usage, cost per year and working conditions.

Lubricants for Electrical Equipment

HOT bearings are due to a large extent to poor lubrication or to an inferior grade of lubricant. The fundamentals of correct lubrication are the use of the right lubricant, applied in the right way, and in the right amount. The amount and application of lubricant depend largely upon the design of the bearing and the service conditions.

OIL.—Grade.—Oils are either animal, vegetable or mineral. For mining haulage equipment use a good grade of neutral mineral oil. It must be free from acid or alkali, either of which will corrode the bright surface of the metal.

Purity.—The oil should be free from dirt and water. Water will reduce the lubricating value of the oil, as it tends to wipe the oil from the bearing. Particles of dirt and grit will increase the friction and cause the bearings to heat up.

Fluidity.—The oil should flow readily and be taken up by the waste and held. If it is too thin, the waste and bearing will rapidly drain the oil, and the bearing will soon run dry. Therefore the oil must have enough body to cling to the waste and be fed to the bearings

as required. It should be heavy enough to furnish a supporting film between the journal and the bearing to sustain the load. For this reason a light or thin oil should be used in winter and a heavy or thick oil in summer.

The oil should not gum, as it will then clog up the lifting or wick action of the waste and tend to prevent the oil from entering between the journal and bearing surface.

Cost.—Quality of oil should never be sacrificed to first cost. Tests to determine the quality and lubricating properties of an oil require an extensive laboratory equipment; therefore one should always deal with reliable producers who have had years of experience and testing facilities which enable them to guarantee the uniformity and reliability of their product.

SPECIAL LUBRICANTS.—Specially prepared lubricants which are not entirely oils are used by some companies with very good results, and are highly recommended.

GREASE.—*Uses.*—Grease is used in connection with the lubrication of some of the old type haulage motor bearings and on all main motor gears and pinions. The same grade of grease selected for motor bearings can be used for the gears and pinions, but some special grades and compounds prepared for gears and pinions are not suitable for motor bearings, on account of their high melting point.

Grades.—Grease consists of a fatty soap impregnated with a mineral oil. The solid part simply acts as a carrier for holding the oil in position, and has little value as a lubricant. Greases usually are graded according to their stiffness, which has an important bearing upon the ease with which they can be handled and the service they will give. They are mostly graded from the softest to the hardest with numbers indicating their relative melting point. Thus a No. 1 grease usually is softer than a No. 2 grease, etc. A limesoap grease with a neutral reaction (which does not show any traces of an acid or an alkali) gives best results in service.

Purity.—The grease should be free from dirt and grit and the percentage of water should be very low, as all of these would reduce the lubricating value and increase the heating of the bearing.

Melting Point.—To insure its being retained in the bearing, the grease should have a melting point of 10 to 15 deg. C. above the normal operating temperature. If it is too hard it will not flow readily and will increase bearing losses. On the other hand if the melting point is too low it will not be retained in the bearing.

Cost.—The same consideration referred to in connection with oil also applies to grease. In general, do not be misled by a highly colored or scented product with a fancy name and a correspondingly high price.

WASTE.—*Grades.*—Waste or packing is commonly made up of wool threads alone, or wool and cotton threads mixed with a resilient mineral or fiber, such as asbestos, cocoa fiber, moss, etc.

Dirt and Moisture.—Dirty particles are likely to be carried by the oil up to the bearing and work into the oil film. All waste contains some moisture, but if too much is present, you pay for water instead of waste.

Elasticity.—Unless the waste is springy and elastic it will fall away from the bearing window and thus cut off the supply of oil being fed to the journal. To obtain this quality it must be of the right grade of material,

such as long wool threads or a mixture of wool threads, cotton threads and a fibrous material. By proper machining, the material is intimately mixed and formed into a fleece with the threads all running in one direction.

Quality.—Wool waste is commonly considered the best material as it is springy and elastic after being soaked in oil and readily parts with the oil to the journal. However, its absorbent property and wick action are not quite as good as that of cotton threads. Cotton threads are not springy, but absorb more oil than wool and have a better wick action. Some manufacturers consider that a mixture of wool and cotton threads gives best results in service. A good packing should have the power of holding the correct quantity of oil evenly distributed through the threads of the waste, which also should be able to carry the oil by wick action against the force of gravity, if necessary to the threads in contact with the journal.

Long fibers are preferable as they carry the oil from the oil well to the bearing windows more satisfactorily than short strands, thus insuring a steady supply of oil. This is made possible by the wick action of the material when in a long continuous thread.

Special preparations to make the waste springy and elastic are made up and used with fairly good results. They consist of various grades of wool and cotton thread mixed with horse hair or asbestos. Another brand is made by binding the waste in small bundles using a thin brass wire.

Good rules to follow in the selection of lubricants may be briefly summarized as follows:

- (1) Trade with reliable and experienced dealers.
- (2) In considering first cost, do not lose sight of final results. A few hot bearings may wipe out all first-cost savings.
- (3) Lubricants that have given good results in service need no further recommendation.
- (4) Neglect frequently is responsible for troubles charged up against oil, grease and waste.
- (5) Proper facilities for handling and storage should be provided.

Many large companies find it to their advantage to make a contract with some reputable oil company for all lubricants used during the contract period. In this event the proper lubricant for each piece of machinery can easily be determined and used for long periods without continual experimentation, with resultant inconveniences and expense.

Prefers Sandpaper to Emery Cloth For Cleaning Commutators

WITH reference to the article on "How Best to Undercut Commutators of D.C. Armatures," which appeared in the Aug. 23 issue of *Coal Age*, I wish to suggest that the statement, "After slotting is completed the face of the commutator should be thoroughly polished and cleaned of all particles of copper by means of emery cloth" be changed to "by means of sandpaper."

My experience has been that sandpaper is the better for this purpose. I have had pump runners, machine runners and motormen use both emery cloth and sandpaper but by discontinuing the emery cloth and using sandpaper entirely, much of the luminous or fiery commutation of the machines was eliminated.

James T. Beard

Working Three Seams of Coal with Slate and Shale Partings

Use Longwall Method—Drive Roads in Middle Seam—Lift Floor and Bottom Coal Advancing—Drop Roof Shale and Work Upper Seam Retreating

IN RESPONSE to the request for criticism and suggestions regarding the proposed method of working three seams of coal separated by slate and shale partings, offered by a correspondent in *Coal Age*, Aug. 9, p. 219, I gladly submit the following outline, as the result of my experience when working under similar conditions.

The correspondent does not state whether the seams are flat or pitching, but I will assume the former condition. In the first place, allow me to suggest that the three seams described cannot, in my opinion, be worked successfully by the room-and-pillar method as proposed. Also, I believe the seams are too thin to consider driving rooms from 60 to 90 ft. in width.

HARD COAL MORE EASILY WORKED LONGWALL

Again, as indicated in the accompanying figure, the two upper seams are described as being "hard splint coal," which would be difficult to shoot and should be more readily mined in the longwall method of working. Whatever method is adopted, however, it will be necessary to brush all roads for headroom, and the longwall method affords ample storage space for the resulting waste material, which is not the case in the room-and-pillar method of working.

The correspondent proposes drawing back the pillars between the rooms by splitting each pillar with a 20-ft. room. In doing so, the roads would have to be brushed as before, making a large amount of extra work, to say nothing of the disadvantage growing out of shooting the hard coal. It cannot be denied that the longwall method of mining not only produces a larger percentage of big coal and a greater output per man per day, but the proposition of ventilating the working face is much easier than in room-and-pillar work.

Briefly, I would open the mine, as our friend has suggested, in the middle seam. I would employ the longwall advancing method, driving the main and branch levels in the middle seam, at the same time lifting the bottom parting and the twelve inches of coal in the seam below, for a width of 12 ft., which

would give ample room for any kind of haulage desired. The waste material should be built on each side of the road.

The branch levels should be driven to the right and left of the main level, at distances of 250 ft. apart. These branch levels will cut off the longwall faces as they are advanced and so concentrate haulage and save traffic. It may be better to drive the branch levels but 10 ft. wide, brushing them in the same manner as the main levels. This will be best determined by the space found to be required for building the waste along each side of the road.

UPPER COAL TAKEN OUT RETREATING

All working places should be driven 8 ft. wide, on 40-ft. centers, which will generally provide material enough for building the necessary packwalls. The working places are driven parallel to the main level and, as each place is cut off by the 250-ft. branch level, the work of taking down the roof shale and extracting the upper coal can be started back on the retreating plan.

It may chance that too much gas will be given off to make this plan practicable. In that case, the work of extracting the upper coal must be started, back at the mouth of the place, and conducted on the advancing plan, shooting down the rock and leveling it off sufficiently to lay track on which to load out the top coal. Part of this rock can be used to build packwalls for the support of the roof overlying the top seam.

It seems to me that the longwall method is the only method to adopt in working these three seams. Driving the gateroads 8 ft. wide, on 40-ft. centers, leaves but 16 ft. on each side of the road as the distance through which the coal must be handled at the face.

ANOTHER PLAN OF WORKING THE TOP COAL

It is possible that the top coal can be worked out on the longwall retreating plan, by brushing a hole 6 ft. square in the middle parting, every 30 ft., and throwing the coal down through these holes into cars standing on the roadway below. If it is found that this can be done there will be a considerable saving effected in the cost of brushing and handling the waste material.

Another plan would be to start back at the same point as in the first working and shoot down the four to six feet of roof shale, and level it off so as to lay the track on this debris. This will enable the working out of the upper seam on the longwall retreating plan, as the seam has a good roof.

My belief is that it will generally prove more practicable to mine the upper seam through holes driven up in the roof of the middle seam, as just mentioned; or else to adopt the advancing plan of dropping the shale parting and carrying the track on top of that waste, while loading out the upper coal. I believe that the

VERTICAL SECTION
SHOWING THE THREE
SEAMS

output, per man per day, would be greater and a larger percentage of round coal produced than by any other plan.

JAMES GRAY.

Newcastle, Wash.

REFERRING to the question of working three seams of coal with slate and shale partings, contained in the inquiry that appeared in *Coal Age*, Aug. 9, p. 219, and the request for any criticism of the proposed plan and suggestions as to the best method of working to obtain a high percentage of production, per man per day, and to get out the coal in as large size as possible, let me say there are several objections to the proposed method.

First, in driving the rooms 90 ft. wide and laying three tracks in each room, there will be a large proportion of the waste rock that must be taken outside of the mine as the rooms cannot gob themselves in this arrangement. Second, where there is so large a quantity of waste to handle there will be much difficulty in keeping the coal clean. It will require close supervision of the miners and the enforcement of strict regulations in regard to the loading of dirty coal.

However, assuming that it is possible to overcome these two objections, there is yet imminent danger of squeeze resulting from driving 90-ft. rooms with 50-ft. pillars between them. A little reflection will show that such a plan is not practicable in this case. For example, the total span of roof resting on a pillar 50 ft. wide, flanked with 90-ft. rooms, is 230 ft., from rib to rib. Then when this pillar is split by a 20-ft. room the two 15-ft. ribs of coal remaining will be crushed and lost beyond recovery.

DIFFICULTY MET IN LOADING CLEAN COAL

In my experience I have seen coal mined under similar conditions in respect to the large proportion of waste material that had to be handled. As far as the work in the rooms was concerned, much time and patience was consumed in keeping the coal clean and loading it in a condition fit for the market. In pillar-work, however, to load clean coal was a practical impossibility, although the partings of slate were not more than 2 ft. thick in that case.

My conclusion is that the three seams mentioned cannot be worked in a single face. I would say, forget the lower and middle seams and go after the upper one, adopting a method of working that promises the best results. To my mind the longwall method is preferably the one that should be chosen in this case. It must be a gateway system, however, as the roof is too strong here to make a conveyor system successful.

Even a room-and-pillar system might be successfully employed in working out the coal in this upper seam. But, under no consideration, should 90-ft. rooms be driven. The width of the rooms should not exceed 30 ft. and a road should be laid along each rib, making the distance for handling the coal at the face less than 15 ft. The pillars between the rooms should have an equal width of at least 30 ft. and as much more as conditions may require.

Care must be taken to extract all the coal and no stump must be left in as that would cause trouble in working the two lower seams. The plan that I have suggested may seem strange to many, but it is my opinion that it would prove the surest method of securing the best results, in the working of these three seams, and I recommend its careful consideration.

In a mine where I worked, in Durham County, England, the coal was 12 ft. thick. Owing to the bottom 4 ft. of the seam containing many impurities, the company mined only the upper 8 ft. of the coal. Later, a new company came into possession of the mine and took out the remaining 4 ft. of bottom coal, finding that it could be made saleable.

My conclusion is that, in the present case, after working out the coal in the upper seam, there would not be any difficulty in working the two lower seams. It is my belief that a lot of trouble and expense will be saved by avoiding the experiment of trying to work the three seams in one operation. THOMAS HOGARTH.

Indiana, Pa.

Mine Safety Bulletins

Getting the miner interested in his own safety—Follows line of least resistance—"Rules made to be broken," the logic of some miners—Insistence on obedience to rules important.

IHAVE BEEN reading the excellent letter of F. C. Cornet, *Coal Age*, Aug. 9, p. 218, in which he strongly urges the need of both operators and miners obeying the spirit of the law and not the letter only. He calls attention to the fact that operators often deceive themselves into thinking that they have performed their duty to the men they employ when they have placed a few safety bulletins and danger signs to warn the unwary miner of his danger.

It is a characteristic of a large class of miners that they are not deeply interested in anything in particular. It may be that this is, in a measure, the result of their daily occupation in the bowels of the earth. However, for that reason, we cannot expect the average miner to become enthusiastic about many things that should appeal to his common sense.

To expect a miner to read elaborate rules and circulars, explaining safer practices in the mine, more sanitary and healthful modes of living and other like things for his betterment, is more than one familiar with his habits will expect.

Some one has remarked that "the average miner is not interested in anything but four o'clock and payday." While that is not far from the truth, it cannot be said to apply solely to miners. The majority of workers regardless of their occupation have much the same characteristics, in reference to the hours they work and the compensation they receive.

Bearing these facts in mind when we make certain rules, the first thing to be done is to start a campaign of getting the men interested in their own safety. It is useless to draft a set of rules and hand a copy of them to each workman, expecting that they will read them carefully and everything will go along well from that time, as though the system was to be automatic. We shall soon learn that the rules might as well never have been published.

Naturally, men follow the lines of least resistance; and the success of any system we would inaugurate must make that line lie in the direction of safety. Too often, the idea prevails among workers that "rules are made to be broken." Of course, they mean it as a joke; but the joke generally becomes a reality and we learn too late that we have taken the wrong road to insure the success of our efforts.

A sign or a bulletin well worded and easily readable is the best foundation for starting a good mining cam-

paigned of safety. For example, take a bulletin that reads somewhat as follows:

“Never forget that the safety of an employee is more important than the work itself.”

Such a bulletin can be read at a glance. Even the fellow who cannot read it will not fail to get the sense of it from those who have read it and comment on it freely. But, example goes further than precept and when it appears that the mine officials live up to the spirit of these signs and bulletins, posted in all conspicuous places and freely handed around among the men, results will follow.

Nothing is more important than insistence on strict compliance with rules and regulations on the part of mine officials and workmen alike. In my opinion, the suggestion that too strong insistence of this kind will cause men to quit and find work elsewhere is not true. Why men leave one mine and seek work in another is owing to the lack of good working conditions and not because a boss insists on safe mining practices.

Pikeville, Ky.

GEORGE EDWARDS.

Good Light Needed in Firebossing

Close study of lamps and lighting conditions in gaseous mines—Time lost working with dim light—Firebosses' service neglected.

IT IS seldom that I have been more impressed than when reading the two letters that appeared in *Coal Age* Aug. 9, the one entitled, “Approving Use of Miner’s Electric Cap Lamp by Firebosses,” p. 217; and the other, “Give the Fireboss the Best Possible Light,” p. 218. The writers of these two letters are to be congratulated on their statement of facts as they have found them.

For several years I traveled through both the anthracite and the bituminous regions, visiting the mines and working in the lamphouses. During that time I often made the rounds with firebosses, mine foremen and inspectors. My purpose in doing so was to make a close study of safety lamps and their use, in daily mining practice, in gaseous mines.

I wanted to obtain first-hand information regarding conditions of lighting, in the performance of work in the mine, in order to determine more exactly the requirements of lamps adapted to the work. What I learned in this manner has been of great advantage to me since and I can fully appreciate what a good light means to men working in a coal mine.

When going about with the men, as I have stated, all of whom were making their examination of the mines in the old way, by the dim light of a safety lamp, it appeared to me that much time was lost and the life of the examiner often menaced by losing his light and having to retreat in the darkness to a place where it would be safe to relight his lamp.

Let me say that one of the most valuable services rendered by a fireboss, a mine foreman or an inspector, in making an examination of a mine, is being neglected by the management in failing to provide him with the best possible light, in addition to his safety lamp or other means of detecting the presence of gas. Attention has been drawn to the fact, which we all recognize, that gas is not the only danger that it is the duty of the examiner to seek to find, and these other dangers require a good light that will reveal their presence.

Inquiries
Of General Interest

Use of Steel Mine Track Ties in
Heavy Motor Haulage

Proposed Long Haul with 10- or 12-Ton Locomotives — Steel Track Ties Not Recommended for Heavy Traffic — Conditions Must Determine

WE ARE about to lay 3,000 ft. of track, in the extension of our main locomotive haulage road. This track will be laid on an easy grade, where the bottom is hard and always level across the track. That is to say, there is no sidehill, giving an inclination that would have a tendency to spread the rails. One 10-ton and one 12-ton electric motor will be used to haul the empty cars from the shaft bottom to the inside parting and bring the loaded cars back to the shaft. The entire distance is nearly two miles for the round trip. Each locomotive will haul trips ranging from thirty to forty cars.

Before proceeding with this work, we are anxious to learn of any coal mine using iron or steel track ties, on a main haulage road where the locomotives weigh as much as ten or twelve tons. Assuming the ties are properly spaced and the rails heavy enough to carry the weight without bending or being thrown out of alignment, we desire to ask if steel track ties will stand up under this service and give satisfaction.

Wooden track ties are becoming more and more scarce each year, and their required size lessens the headroom or height above the rails by several inches. On this account, it is often necessary to shoot down the rock in many places on the haulage road. Further light on the subject by *Coal Age* will be appreciated.

Punxsutawney, Pa.

R. W. WALKER.

This inquiry being submitted to A. F. Brosky, the Pittsburgh editor of *Coal Age*, brought the following response: “It is my belief that steel mine-track ties should never be used where 10- or 12-ton locomotives are employed on the main haulage road. During the last two years, I visited but one mine where steel track ties were used on butt entries. Such ties may work well where but a small tonnage is hauled, at a comparatively low speed, and the bottom is hard and not liable to heave. Also, the coal must lie practically level to obtain the best results in the use of iron and steel ties. While there are varying conditions that would cause exceptions to the rule, I think I am safe in saying that the use of steel track ties should be restricted to traffic where the weights of the locomotives do not much exceed six tons.”

In addition to the question of rigidity, in steel ties for mine tracks, there must also be considered the question of the effect of corrosive or acid mine waters on the ties. The action of such waters on the metal may often greatly impair the efficiency of the tie and shorten its life. We agree with the suggestion that steel ties should not be used where the track is laid on a soft bottom, or there is the slightest tendency of the floor to heave.

Consideration must also be given to the fact that, in the use of steel ties, there is not the same opportunity afforded for the ballast to hold the track in place, as

where wooden ties are imbedded in the ballast, which holds them firmly and prevents shifting. This is an important factor where the track makes a sharp bend in rounding a curve and, in any case, where trips are hauled at a comparatively high speed.

In locomotive haulage, particularly where the traffic is heavy, the absolute rigidity of the track, which is assured by a solid roadbed, is of the first importance. The necessity of brushing the roof to secure the necessary headroom where wooden ties are used is a matter of secondary importance in the economic operation of the mine. We shall be glad to hear of the experience of others and learn their opinions in respect to the limitations in the use of iron or steel track ties, under heavy traffic.

Examination Questions Answered

Anthracite Foremen's Examination, Districts 8-14, Incl., 1923

(Selected Questions)

QUESTION—*With a fan developing 30 hp. at the fan and a water gage of 2.3 in., when but 50 per cent of useful effect is obtained, what quantity of air would be available?*

ANSWER—The useful effect being 50 per cent, the horsepower on the air is one-half that delivered to the fan. Therefore, the work performed on the air is $0.50 \times 30 \times 33,000 = 495,000$ ft.-lb. per min. The pressure corresponding to a water gage of 2.3 in., is $2.3 \times 5.2 = 11.96$ lb. per sq.ft. Finally, dividing the work performed on the air, expressed in foot-pounds per minute, by this unit pressure gives for the quantity of air in circulation, in this case, $495,000 \div 11.96 = 41,388$ cu.ft. per min.

QUESTION—(a) *What are permissible explosives? (b) What conditions make their use necessary in a mine? (c) What charge limit has been established by the U. S. Bureau of Mines for such explosives?*

ANSWER—(a) The term "permissible explosives" relates to any explosive that has passed the test and received the approval of the Bureau of Mines and is used according to the instructions and subject to the limitations placed on its use by the Bureau. Used under any other conditions, a so-called permissible explosive is no longer one in fact.

(b) Owing to all permissible explosives being practically flameless and possessing a greater degree of safety in the presence of gas or dust than black blasting powder, the use of a permissible explosive, instead of black powder, is essential in all mines generating gas or dust in quantities that render accidents in blasting possible through the ignition of the dust or gas by the flame of the shot.

(c) The Bureau of Mines, in its Miners' Circular No. 2, p. 6, has prescribed a charge limit of $1\frac{1}{2}$ lb. for all permissible powders used in blasting in a mine.

QUESTION—*What are the efficient limits to which the ventilation of a mine may be split?*

ANSWER—Dividing the air current into two or more

separate splits reduces the velocity of the current in the same proportion. The limit of splitting is attained when the velocity of the passing air, at the working face or in any portion of the mine, is not sufficient to sweep away the gases lodged at the roof, in cavities or other void places and keep them clear from such accumulations. Also, the quantity of air in any single split must be sufficient to supply each man working on that current with the quantity of air required by the state mining law and as much more as may be necessary to make the place healthful and safe for work.

QUESTION—*The center props in a slope of 63 deg. pitch are set 5 deg. up the pitch. What is the pitch of the prop?*

ANSWER—In the accompanying figure is shown a portion of a slope having a pitch of 63 deg. with the horizontal. As indicated in the figure, a normal line in the seam or a line perpendicular to the roof and floor makes an angle of $90^\circ - 63^\circ = 27^\circ$ with the horizontal. But, since the post is set 5 deg. up the pitch from the normal, the pitch of the post or the angle it makes with the horizontal is $27^\circ + 5^\circ = 32^\circ$.

QUESTION—*A shaft 500 ft. in depth is to be enlarged; how would you proceed to do the work having special regard for the safety of the workmen?*

ANSWER—The answer to this question must depend on the style of the enlargement intended. The shaft may be a two-compartment shaft and it is desired to make a third compartment or manway, by excavating the material on one side of the shaft, which can be done with perfect safety without interrupting the hoisting of coal or interfering with the operation of the mine. Likewise, a single-compartment shaft may have to be enlarged so as to afford room for two compartments or more.

On the other hand, the question may call for increasing both dimensions of the shaft, making it wider and longer to accommodate larger cages and make possible an increased output of coal. In that case, the work can be done more speedily and effectively by closing down the mine for a month or two in the dull season. To attempt to cut the face of the shaft down while hoisting operations are in progress would be hazardous in the extreme.

Assuming the mine is closed down, the work of enlargement should be started at the surface by installing a templet of heavy timbers that will form the foundation of the new headframe to be erected later when the work is completed. The cage should then be lowered to a point 10 ft. below the surface and holes for cross-buntons cut in the curbing on the two faces of the shaft. Two heavy timbers should be inserted here as cross-buntons, at this point, keeping the cage always below them, using one cage only in this work. On these cross-buntons a platform of heavy 4-in. planks should be laid, for the support of the workmen while enlarging the shaft to the required dimensions. As the old curb timbers are taken out a few at a time, new timbers must be set in place and firmly wedged, supporting them temporarily by struts or posts resting on the solid formation below. In this manner, the work should proceed, in sections of 10 ft., throughout the entire depth of the shaft.

Force of Public Opinion Only Remedy for Coal Strikes

Fixed Code to Avert Tie-Ups Urged by Coal Commission in Report on Civil Liberties—Says Congress Should Take Jurisdiction When Miners or Operators Ignore Law—Indorses Open Shop

In a report to Congress on civil liberties in the coal industry made public Sept. 9 the U. S. Coal Commission enumerated the causes which induce strikes and interrupt interstate commerce, and made recommendations that might help to prevent strikes which threaten cessation of production by the miners. The commission refused to endorse the principle of the closed shop, contending that it was the right of the producers to operate their properties as they pleased, if the laws of the nation were observed. It was the right of the miners, also, the commission held, to organize for collective bargaining, but they, too, must respect the law.

The report follows in full:

TO THE PRESIDENT AND THE CONGRESS OF THE UNITED STATES:

In an attempt to answer the inquiry of the Congress with reference to the "causes which from time to time induce strikes, thereby depriving interstate carriers of their fuel supply and otherwise interrupting the flow of commerce," the Commission finds that a very large part of the friction which from time to time has stopped the machinery of production and frequently resulted in violence and bloodshed has arisen from:

- (1) Disputes as to what are popularly known as the civil rights of American citizens.
- (2) Practical breach of these rights in the operation of the industry, even when they are theoretically acknowledged.
- (3) The inappropriate application to present conditions of principles enunciated under totally different economic conditions.
- (4) Attitudes of public opinion produced by ancient grievances.
- (5) Lax administration of the law induced through fear, favor, affection, malice, hatred, or ill-will.
- (6) Unwise even though lawful interference of strangers in local conditions.
- (7) The effect of universal suffrage upon law administration.

The Right to Run an Open Shop.—There is no intellectual dispute touching the academic proposition of the right of a man to run an open shop, nor of the right of men to organize for the purposes of collective bargaining. The non-union mine operator freely admits the right to form a union. He will not, however, employ union men to work beside non-union men in his mines, assigning as a reason therefor that they are trouble breeders. In other words, when reduced to the actualities of the industry the open shop of the non-union operator is the open mine for non-union labor but closed to union labor. On the other side of the controversy officials of the United Mine Workers of America, in theory, or in the absence of a contract made, admit the principle of the open shop and the legal right of the individual to work therein, but they refuse to work with non-union men, assigning as a reason therefor that no man has any right to obtain benefits which accrue to him through the activities of the United Mine Workers of America and not become a member thereof, pay his dues, and bear his share of the expenses. Thus, the mine workers have also their open shop, but it is open actually only to members of the union.

Those who choose to do so may examine the statement of facts, the affidavits or other documents, and the arguments presented to the Commission upon these subjects. The Commission does not deem it either necessary or advisable to insert these documents in this report, nor to attempt to fix ultimate responsibility. Many, if not all, on both sides are at fault and all have some excuse arising from the weaknesses and passions of human nature. It is sufficient to say that a certain type of mind could reach the conclusion from public statements made, both by the United Mine Workers and union operators, that it was the purpose

of this organization to unionize all the mines of America, peaceably if it could, forcibly if it must. Another type of mind could satisfy itself that the operators of non-union mines propose to keep their mines from being unionized—peaceably if they can and forcibly if they must. Neither of these conclusions would add anything to the sum of human knowledge with reference to actual conditions and attitudes of mind in the mining industry.

The Commission does not find, notwithstanding many unfortunate occurrences, unlawful acts, and unwise statements that it is or has been the ultimate object of the officials of the United Mine Workers of America to unionize all the mines by force if necessary. Upon the other hand, it does not find, regardless of unfortunate statements and unlawful conduct, that it is the fixed purpose of non-union operators to destroy the United Mine Workers of America. The Commission chooses rather to give those who are from the moral standpoint, whatever it may be from the legal standpoint, charged with violation of the law the benefit of the doubt as to criminal intent. The Commission does not believe that the running down of the different unlawful occurrences in the mining industry of this country to the original breach of the law, if it could be found, fixing the responsibility therefor, and then strengthening the case by all subsequent acts of violence and intimidation of like character as set forth in the brief of counsel, would afford any justification, whatever, save as such justification may be found in the common and ordinary passions of mankind, for the other side to have met force by force, to have fought fire with fire.

Relates Some History of Herrin.—The Commission reports certain facts which it believes will give to the Congress and the people a clear understanding of the real situation:

Herrin, Ill., is situated in Williamson County. That county is an American community. Of the 61,092 population given by the last census, 54,052 are white native born and 1,825 are negroes; the foreign born are principally Italians, Russians, Lithuanians and Southern Slavs. Of the native whites, 1,265, or 3.2 per cent, are illiterate, while of the foreign born 30 per cent are illiterate. The native born are the descendants of two streams of immigrants, one from the North composed largely of Pennsylvania Germans, and the other, and predominating element, being from the mountains of Kentucky and Tennessee with some contributions from Alabama and the Carolinas. The community has distinctly a Southern flavor in both dialect and personality.

The soil of the county is largely of a light red clay. Before the beginning of the era of coal mining the inhabitants eked out a precarious existence by agriculture. Then one of the richest coal regions in the world was discovered. Almost the entire country was underlaid with three veins of superior bituminous coal. The population gradually changed in reliance for a livelihood from agriculture to the coal-mining industry, which supports three cities of 10,000 population each and several smaller ones. It has splendid residences, fine business blocks, good schools, churches and lodges. It has more automobiles than any county in the state save Cook. It has a certain lawless element and many feuds. The blood of the people is such that they fight for their convictions. It has more homicides than any other county in the state except Cook. It is intensely patriotic and had a fine record during the World War. Its people are intelligent, soft-spoken, extremely religious, not given to profanity, and would resent any suggestion that they were not good, patriotic, American citizens. How can one account for the execration of such a county as this at the hands of the American people? It is not difficult to find the reason when the facts are known.

When mining began in that county it was upon a ruinously competitive basis. Profit was the sole object; the life

and health of the employees was of no moment. Men worked in water half way up to their knees, in gas-filled rooms, in unventilated mines where the air was so foul that no man could work long without seriously impairing his health. There was no workmen's compensation law; accidents were frequent and there was no common ground upon which employer and employees could meet. They had no interests in common, and they regarded each other with hostility and distrust. The average daily wage of the miner was from \$1.25 to \$2.

Then came the union in 1898 and 1899. Peace and goodwill and mutual respect have been the general rule since that time. The Workmen's Compensation Law was enacted. Earnings advanced to \$7, and even to \$15 a day; improvement in the working conditions was reflected in the appearance of the workman, their families, their manner of life and their growing cities and public improvements. There are 13,000 miners in the county, 62 per cent of whom own their own homes, and most of them own automobiles. All occupations are unionized. They believe in the union, for they think it brought them out of the land of bondage into the promised land when their government had been careless or indifferent to their needs. They hold themselves to be good Americans and proved it during the Great War, but what they have of daily comfort they think comes from the union and not from the government.

The county was 100 per cent unionized when the promoter of the Southern Illinois Coal Co., started in as a "wild-catter" to operate a strip mine, investing in it some \$250,000 or more. In April, 1922, he secured the consent of the union to work at uncovering the coal during the strike with the promise that there would be no production of coal. The union men were discharged June 13. Then workmen from the labor agency in Chicago began to appear and armed guards from the Hargraves Detective Agency were placed about the mine to protect it. These facts indicate that he intended to work the mine and feared trouble.

A call from Chicago was made on the Adjutant General on June 17 for troops although there had been no attack on the mine at that time. Workmen arriving from Chicago had been intimidated and some turned back. It is not needful to report the acrimonious controversy between Colonel Hunter and the Adjutant General of Illinois with reference to the responsibility for failure to secure the presence of the State militia. The highway ran by the Lester mine and persons traveling it were stopped by armed guards. Stories were circulated that they assaulted travelers on the highway, held up and robbed people, insulted women, and that they were guilty of general terrorism. Some were pure fabrications, other grossly exaggerated, while others were true. The report went out that the sheriff had been killed in an attempt to interfere with the unlawful activities of the guards. Pickets loitered about the mine, and assumed a provocative attitude. The mine owner appealed to the sheriff through his superintendent. The sheriff visited the mine, but made no effort to prevent the trouble. He was a union miner until elected sheriff, and was at that time candidate for County Treasurer, and later was elected by an overwhelming majority.

The State's Attorney, operators, union officers, and citizens appealed to the owner and his superintendent to cease operations, and warned them that bloodshed was certain. They replied that they had been in such situations before and knew how to take care of themselves. On Wednesday morning, June 21, a party of workmen for the mine was detained at Carbondale and started overland in a truck for the mine, piloted by an automobile. They were ambushed and four men were wounded, one mortally. The same unlawful mob raided hardware stores at Herrin and Marion and took all guns, revolvers and ammunition, telling the proprietors to charge them to the locals. Wednesday afternoon a large force of armed men surrounded the mines and three union men were killed. One of them, George Henderson, known as "Geordy," was a popular favorite, and the story was circulated that he was killed while attempting to reach the mine for a peace parley. In the evening an airplane reconnoitered the fortress, and Robert Officer, an office man at the mine and one of the survivors, claimed that the

airplane dropped bombs on the mine, but as the attacking force was using dynamite he could easily have been mistaken.

Flag of Truce Fired On.—Conference after conference took place in the hope of adjusting the situation. Shortly after daybreak Thursday morning firing began again. The survivors of the mine claimed their white flag was fired on and ignored. The besiegers claim the besieged fired from under the white flag. The fight did not last long, and there was a parley. It was agreed that the besieged should march out unarmed and have safe conduct out of the county. It is reasonably certain that those who made the promise made it in good faith; but in the meantime recruits were arriving by the hundreds, not only from Williamson County but from adjacent counties.

The crowd became rampant. It was reported that troops were on the way. This, added to previous stories, made the crowd wild for revenge. The fact that most of the stories were untrue made no difference; they believed them and acted accordingly. Three-fourths of a mile from the mine, McDowell, the superintendent, was taken from the line of prisoners and killed. Then someone suggested that they "kill them all and stop the breed." The suggestion was acted upon and the men were taken from the road into the wood, lined up before a barbed wire fence, and told to run. As they ran, while climbing the barbed wire fence, the mob fired.

There were between 40 and 60 prisoners; 16 were killed at or near the barbed wire fence; some escaped and were never captured. Hunting parties pursued those who escaped. Six men, four of whom were wounded, were rounded up by a portion of the mob and taken into the city of Herrin. They were tied together by their necks, marched to the cemetery, and butchered. After they were shot down, two or three of them who cried for water had their throats cut. Strange to relate, one of them survived and was able to tell afterward how one of the mob expressed impatience at his tenacious hold on life, and kneeling with one knee on his chest, he took the helpless man by the ear, and twisted his head around so that he had easy access to his throat, which he then slit with a pocket knife. Nobody will ever know how many were killed; the best estimate is twenty-five. After the surrender of the men, the steam shovels and all other equipment were dynamited and burned.

Neither the sheriff nor any of his deputies interfered or even visited the scene. The police officers of Herrin ignored the march through one of the paved streets of the city of the six prisoners and their execution at the cemetery, although all the rest of the population knew about it and many followed and witnessed the tragedy.

Questions Communism Charge.—It has been suggested that this was a communistic movement. It is true that communists have made efforts to establish organizations in that county and that a few foreigners were induced to join; but there is no evidence that this had any relation to this lamentable and horrible occurrence. The voters are intensely partisan and divide along normal party lines with a negligible Socialist vote.

These homicides took place in the presence of innumerable witnesses. It cannot be true that the persons or many of them who engaged in the mob are not known to numbers of the citizens of that county. If those indicted, tried and acquitted were not guilty, there must be many people in Williamson County who know who the guilty ones are. Yet there has been no conviction for this breach of the criminal law nor is there the remotest possibility there ever will be one.

Coroner's Jury Voices Local Viewpoint.—The local point of view is well stated in the verdict of the Coroner's jury: "We, the jury, find from the evidence that the deaths of decedents were due to the acts, direct and indirect, of the officials of the Southern Illinois Coal Co. We recommend that an investigation be conducted for the purpose of fixing the blame personally on individuals responsible."

There is no doubt that when the promoter of the Southern Illinois Coal Co. started to operate his mine in defiance of

the union, he was inviting mob violence and flirting with death; he knew it and prepared to meet it. The resentment was spontaneous and instantaneous. He challenged the supremacy of the union. Those in the mob undoubtedly believed that it was an attempt to return to old conditions before the mines had been unionized. There were, of course, fatal omissions of duty on the part of public officials, and neither the officials nor the public wanted troops to protect the operator in his union-destroying operations. It might have been stopped by the sheriff, by the officers of the miners' union, by public sentiment, but all were for the union and all believed that an attempt was being made to destroy it.

Although the Commission finds that the tragedy might have been prevented, it also finds that the union officials and the public officials never anticipated that it would happen. They all believed that the non-union miners would be kicked out of the county and that this would end it. Then came into the equation an unknown quantity. Nobody can tell how much this had to do with the failure to punish the members of the mob. It was the storm of protest that swept through the public press of this country. It was the condemnation of the union, the union officials, and the public officers. It presented the common aspect of a stranger interfering in a family row. The Commission, of course, cannot say what might have been the result if public opinion had waited until the courts had either attempted or refused to discharge their duty. But the whole economic life of the county puts it beyond peradventure that when an indiscriminate assault on the union and the people of the county was made it rendered the punishment of anybody impossible in that county.

Finds No Justification for Union Audacity.—This statement, unfortunately, cannot end here. Clothed with all the charitable excuses above set out, these furnish no justification for the brazen audacity with which subordinate officials and members of the United Mine Workers of America defended the crime and the criminals. That they were espousing the cause and defending the lawbreakers is further shown to the Commission by the fact that they have since bought the mine where the tragedy occurred, and have paid therefor \$729,000.

Bearing in mind the changed and bettered conditions which came to this country through the unionization of its mines, with its resultant attitude of mind toward non-union labor, the Commission calls attention to the fact that the bituminous mines north of the Ohio had also become largely unionized. These mines came into competition with certain non-union mines in parts of Pennsylvania, West Virginia and Kentucky. It was felt by union operators that the non-union mines either undersold them in the market or made a greater profit than their own and that this was due to cheaper labor. How far these operators desired the United Mine Workers to go in unionizing mines would be mere conjecture, but there is no doubt of their desire to equalize conditions by bringing the non-union mines under union control. That vast sums of money have been spent in this effort; that rioting and bloodshed and destruction of property have taken place, is beyond doubt. For years the controversy has gone on.

The area of greatest civic disturbances has been the counties of Mercer, McDowell, Mingo, Wayne, Boone, Logan and Kanawha, in West Virginia, and the counties of Johnson, Pike, Harlan and Bell in Kentucky. All of these counties are mountainous, underlaid with rich veins of coal. They were almost exclusively peopled by mountaineers, native whites of ancient American ancestry. They were a law unto themselves. Their annals are crimson with feuds and the gun was the "supreme court." The coal-mining industry has introduced large numbers of negroes, as well as foreign-born and native whites from other sections of the country; still the local traditions exert a dominating influence and account very largely for the outbreaks of violence. Much of this violence had nothing to do with the coal industry but had to do with the nature and racial characteristics of the people, yet it has furnished excellent argument for one side or the other. The primitive conditions of life of this

people can scarcely be paralleled anywhere, unless in the mountains of North Carolina and Tennessee.

The mountains of West Virginia come down to a point like the letter V and down this narrow crease flows a small river; leading into this from a smaller valley there will be a creek, into the creek a branch, and into the branch a fork. The nomenclature of the entire region is based upon the names of these rivers, creeks, branches and forks; towns, camps, mines and railroads being named after them, and each constituting a little world within itself. Each district is separated from its neighbor by a mountain range, or ridge, with no roads or direct means of communication. Agriculture is meager and primitive, and the homes are for the most part, small whitewashed dwellings or log cabins in keeping with the poverty-stricken surroundings.

While these regions were undeveloped the coal mines had only a potential value because of the difficulty and cost of constructing railroads and getting the coal to market. The exploitation of this coal was nearly coincident with the growth of the United Mine Workers, though parts of this general region had been organized long prior to the events of 1919.

Preparations to Unionize Unorganized Fields.—There were serious labor troubles in 1912-1913, after which there was a period of quiet until the extraordinary demand for coal during the World War. At the same time the union made elaborate preparations to unionize the unorganized fields. The topography of the country, the sparseness of the population, the isolation of the valleys one from the other, the general poverty of the counties, lack of level ground upon which to build towns, and the fact that mining machinery and equipment were usually on leased ground are all important factors in the situation. The operator had to establish his business where the coal was and bring his labor to it. He had to construct houses for his employees and furnish them with necessary appurtenances, such as water supply, and establish stores where they might purchase food and clothing. He arranged for medical attendance and hospital service, provided for schools and school houses, employed teachers, or, at least, paid part of their wages, and endowed churches and community buildings.

Thus it appears that each mine or group of mines became a social center, with no privately owned property except the mine and no public places or public highways except the bed of the creek which flowed between the mountain walls. These groups of villages dot the mountain sides down the river valleys, and need only castles, drawbridges and donjon-keeps to reproduce to the physical eye a view of feudal days. There are no public corporations in many places to provide for the public welfare or to maintain law and order, so the mine owner had one of his employees deputized by the sheriff, and thus came into existence the much discussed "mine guard." As the employees were the only ones who were furnished homes, and their occupancy was contingent upon their employment, the courts of that state have decided that the relation of landlord and tenant did not exist, but that it was the relation of master and servant and when the employment ceased the mine owner came into possession of the house.

Thus the position of the miners in company-owned houses is anomalous. They are not tenants and have no more rights than a domestic servant who occupies a room in the household of the employer. The documents which pass for leases often give the company complete control over the social life of the families who live in the houses owned by the company. One which has been called to the Commission's attention from Fayette County, Pennsylvania, actually stipulates that the lessee "hereby further agrees not to use, allow, suffer or permit the use of said premises, or the private ways or roads through and over other lands of the lessor used to reach said premises from the public road, for any purpose other than going in to said premises from the public road, and out from the same to said public road, by himself and the members of his family; and further to do no act or thing, nor suffer or cause the same to be done, whereby the public or any person or persons whomsoever, may be invited or allowed to go or trespass upon said

premises, or upon said private ways or roads, or upon other grounds of the lessor, except physicians attending the lessee and his family; teamsters or draymen moving lessee and his family belongings into said premises or away from the same; and undertakers with hearse, carriages and drivers, and friends, in case of death of the lessee or any member of his family."

Why Miners Seek Own Remedies.—Under existing laws the miners have a legal right to sign and the companies have a right to require them to sign such leases as a condition of obtaining employment. That they are ill-advised, obnoxious and inconsistent with the spirit of free local communities hardly requires argument. Self-respecting American citizens will find a way to put an end to them. In the case of a helpless, submerged working population, the legislatures of the several states might well consider making such "leases" illegal, like any other contract which is contrary to the public interest. Self-respecting American miners, who have on other occasions shown themselves by no means contemptible defenders of their own interests, may prefer to take the remedy into their own hands and by insisting on reasonable leases, on the incorporation of their villages, and otherwise, win for themselves those elementary civil liberties which must always be won and held by free peoples for themselves rather than thrust upon them by external benevolence.

Operators rarely, if ever, reside at the mines; managers and superintendents were the possessors of all the authority, both public and private.

Whether there was an agreement between the United Mine Workers and the Operators' Association of the Central Competitive Field by the terms of which the union was to undertake the complete organization of the West Virginia and Kentucky fields is the question involved in an injunction suit tried before the Judge of the U. S. District Court for the Southern District of West Virginia, the evidence in which was concluded June 3, 1923. For the purposes of finding the facts which this Commission deems of moment to Congress it is not needful that the Commission should consider this question.

If one were to assume at their face value the statements presented by non-union operators, together with the record of convictions in the courts, he would be justified in finding that it was the deliberate purpose of the United Mine Workers to compel all operators to unionize their mines, and force agreement, not only with reference to wages and working conditions but the check-off and other matters. If, upon the other hand, statements with reference to intimidation and violence exercised toward the mine workers are taken at their face value, one would be justified in finding that a vast majority of the miners of this country were sincerely desirous of joining the union, paying the check-off and delegating to a central body for settlement, subject to their ratification, all questions of wages and working conditions in the industry. Blacklisting can clearly be proven from the testimony; it can clearly be shown from counter testimony that it has ceased to be used.

Much Testimony from Both Sides Valueless.—But the Commission is unwilling to guess as to the truth. A large part of the testimony furnished is absolutely valueless. It consists of statements and affidavits. It is not surprising that the laymen could believe these things, but that lawyers could try to impress the Commission with the absolute verity of these statements is somewhat remarkable. No opportunity has been afforded for cross-examination. No means have been devised to punish anyone for perjury. There is no way in which the Commission can test the interest, bias and prejudice of the witness that may be done in an ordinary lawsuit. Nor would men, when moved by self-interest, refuse to admit that acquittal or convictions cannot be relied upon as furnishing the absolute truth of the guilt or innocence of the parties charged. The verdict is as likely to come out of the atmosphere as it is out of the evidence.

Of course, there are men in the non-union fields who desire the union. How many, nobody knows, nor will there be any way of telling until the rights of American citizens have not only been admitted but have been guaranteed to

them by the courts and officials of this country. Without minimizing the number who may have desired to join the union, it is nevertheless the truth that in 1919 the United Mine Workers began an extensive drive to unionize the remaining unorganized fields of West Virginia. Although many of the miners desired unionization, it does not appear that this was a spontaneous movement of the non-union miners but rather an attempt by professionals especially skilled and trained in the art. Only a secret ballot conducted under absolutely impartial conditions could determine the actual attitude of the majority of the miners.

How Union Organizers Work.—The system has been that organizers go to a camp or mine village and the nucleus of a local is formed. Then a committee from the local waits on the superintendent, and demands that the operators sign a contract recognizing the union, making the mine closed to non-union labor and granting the check-off. On refusal a strike is called, and this inevitably leads to complications. The striking miners occupy the houses of the operators, and operations cannot be resumed until the operators dispossess them and fill their places with other employees. The strikers refuse to vacate the houses and evictions follow. This starts hostilities. The organizers find a suitable spot in the vicinity, erect tents and furnish relief funds for the evicted miners and their families. An armed truce exists, ultimately breaking into open war. Owing to the rugged nature of the country, men can secrete themselves on the mountain sides of the narrow valleys and with long-range rifles shoot into the tippie or mine shaft. The power house or tippie is dynamited and destroyed. Workers are ambushed and killed.

The operator appeals to the sheriff. The sheriff informs the operator that he has no deputy to spare and no funds to hire deputies with. The deputies are not appointed by the sheriff, but by the county court, and in some instances the court has appointed deputies at the expense of the operators. The miners regard these deputies as hirelings of the operators, and thus the bitterness and hostilities grow until the mine is put out of operation because workmen are afraid to stay at the mine, or because the mine is destroyed. The United Mine Workers of America have paid more than \$400,000 in damages for the destruction of the Willis Branch Coal Co.'s mines.

Organizers Build Up Class Hatred.—Sometimes the first acts of an organizer is to denounce constituted authorities, advise armed resistance to civil process and police control of public order. This foolish talk is naturally creating a feeling of resentment and hostility upon the part of public officials, which runs from the Governor down to the local constable; it is reflected by business and professional men and practically all classes not directly affiliated with labor unions. Thus class hatred has grown up, which may well be compared to the family feuds that formerly existed in this mountainous district. Hatred, bitterness and mendacity are cultivated on all hands as virtues, and it is difficult to put your finger upon a statement that you know is absolutely true.

The other side of the situation is that the operators of non-union mines are thus far determined never to enter into contractual relations with the union. Entrenched in their mountain strongholds, with control of the local governments and with ownership or possession of all the lands, they feel that they have an economic advantage so long as the union can be kept out. They stop the union at the mouth of the valley. Many require applicants for jobs to sign what is commonly called the "yellow-dog" contract, justifying it by pointing out that the union when in control requires the employer to sign a similar "yellow-dog" contract. Members of the union are discharged and blacklisted.

Many operators, however, do not use the "yellow-dog" contract, believing that it is immoral, or at least a tactical blunder, and that it has resulted in more harm than good. All sorts of opinions are expressed by the miners in these fields. Many of them worked formerly in union mines, and were not pleased with the "check-off" and union rules, and migrated to non-union districts to escape the unions. Many of them are seasonal miners, small farmers and other

workers, who come to the mines in the busy season, where they work at odd intervals. These men are not interested in the union and do not care to be long to it. The non-union miner also reaps the advantage and bears none of the burdens of the union.

How Mine-Guard System Originated.—The non-union mines are not run as they were in Illinois before the union took charge. There has been a great improvement in wages and in working and living conditions, and thus incidentally the United Mine Workers have bettered the conditions of those who are not members of their organization. The so-called mine-guard system is a result of the inability of local government to maintain law and order. Take Logan County, West Virginia, as an example. It covers over four hundred square miles of bold mountains. The Guyan River traverses it for thirty-five miles, and fifty thousand people live in scattered mine camps perched on the mountainsides along the river. Logan is the only town of considerable size, and there are but two incorporated towns outside of it, in the valley.

These numerous mining camps contain native whites, blacks, and foreign born, the latter varying with the camps but averaging 20 to 25 per cent. There are 70 companies operating 145 mines. Tax rates on land are necessarily low, as a high rate would prove confiscatory to the farmers, although farming is a negligible factor in the economic situation. The taxes raised are insufficient to maintain a large force of peace officers, although crimes by violence and moonshining are frequent throughout the mountain regions. So there came into existence what is commonly known as a mine guard, an officer appointed by the courts and paid by the operator.

The clamor raised against these deputies caused a change in the method of paying them. The operators now "loan" the county an amount equal to the extra cost of maintaining these special deputies. There is no record that these "loans" have been repaid and the operators do not seem to be pressing for payment. In Logan County the sheriff has nine regular deputies and many others who are stationed at the mines. Many of these are stable bosses, paymasters, and office guards, sanitary officers, etc. One of their special duties is to keep a sharp lookout for union organizers, and to devise ways and means to discourage them from remaining longer than the next train. The steep mountainsides converge at the banks of the Guyan River and a railroad bed has been cut out of the side of the mountain. There is here and there an impassable road, but generally speaking, all the ground except the bed of the creek is privately owned, and a union organizer can scarcely move off the station grounds without becoming, technically at least, a trespasser.

Once his business is discovered, it is the duty of the deputy sheriffs to prevent his activity by ejecting him from privately owned property. Actually, without the consent of the operators, a union organizer can do little more than ride on a train and look out of the windows. The operators' associations do not deny that it is their determination to keep out organizers, or "agitators," as they call them. They assert that their right to exclude objectionable persons from their mine property is as clear as the right of a manufacturer in Chicago or a home-owner in Washington to exclude undesirable persons from their premises. Whatever may be the legal phase, it is undoubtedly a fact that under present conditions, Logan County, as well as Mingo and McDowell counties, West Virginia, are now closed to representatives of the miners' union, especially if they engage in union activities.

The operators claim that the exclusion of the organizers has prevented destruction of property and loss of life, while the miners claim that the presence of armed men about the mines is bitterly resented by the workmen and that the ultimate result is an uprising against a system amounting to peonage.

Nine Hundred Indictments Pending in Johnson County.—These theories may be illustrated by Johnson County, Kentucky. It is a small county in population, probably 15,000, almost all white, who are typical mountaineers. There are

now pending on the Criminal Court calendar 900 indictments. Each grand jury returns 250 to 300 indictments, and meets four times a year. The sheriff is a mountaineer, and before his election was a union miner. At Thealka and Van Lear, near Paintsville, the county seat, are the mines of the Northeast Coal Co. and the Consolidation Coal Co. The relations of these companies with their men had always been harmonious until the calling of a strike by the miners' union.

The officials of the companies applied to the sheriff for protection, they, at that time, having no guards. He refused, and the reason for his refusal is a subject of dispute. The operators allege that the sheriff refused to appoint any deputies to guard the property, while the sheriff insists he was willing to appoint deputies, but refused to accept those nominated by the coal companies. There were no deputies appointed. Shortly afterward, men going to and from work at the mines were ambushed and shot. A local constable at Paintsville appointed twelve deputies who attempted to protect the mines and miners at Thealka, but without success, as two men at the Thealka mine were blown up by dynamite and killed.

The experience of the Consolidation Coal Co. at Van Lear was similar to that of the Northeast Coal Co. at Thealka. After workmen had been threatened and intimidated, the town board of Van Lear authorized the town marshal to appoint ten deputies. During this strike the drift mouth of the mine at Muddy Branch was dynamited.

Logan County, West Virginia, and Johnson County, Kentucky, are compared for the reason that at the outbreak of trouble in Johnson County the sheriff was the secretary-treasurer of the miners' local. There were no mine guards in the county, and the violence that broke out could not be justly chargeable to anything except a determination on the part of the strikers that the mines could not operate unless they accepted union terms. During all this strike district officers and organizers were busy in Johnson County. The Commission received a telegram from the president of District No. 30, and the secretary-treasurer, dated Paintsville, April 5, stating that their lives were menaced by mine guards. No confirmation of this telegram could be secured. The sheriff, a friend of these union officials, never heard of the affair, and no other person could be found who knew anything about it.

The irrepressible conflict between the organizers of the United Mine Workers and the non-union operators and miners, with the racial traits and characteristics above described, together with the inability of the state and local authorities to cope with the situation, is the real cause, not the mine guard. That, however, a public police official should be privately paid is indefensible. It is so admitted to be by the Governor of West Virginia.

There seems to be no evidence that people have been interfered with, either in the free use of the mails or in the receipt of their mail.

Public Officials Resent Unionization Plans.—There is now a practical cessation of violence in the coal fields of West Virginia and Kentucky due to the activity of state and county authorities in prosecuting and convicting persons, to proceedings in the federal and state courts for injunction, and to the desire of both sides to prevent their cause being prejudiced by unlawful acts. Unionism in the Logan, Mingo and northeastern Kentucky fields is not largely the outgrowth of local sentiment but is the result of a campaign of foreign organizers. The United Mine Workers do not deny that it is their purpose to unionize these mines if possible. This is so deeply resented by public officials and all other persons not engaged in mining that free travel, free speech and public assemblage has been practically abridged. The foreign element is not responsible for any of the troubles that have occurred.

The conditions now are those of an armistice which, unless peace can be secured with a better understanding, is liable to break down in trouble, resulting in riot, bloodshed and destruction of property.

Recurring to the Herrin (Ill.) situation, there is indisputable proof that three union miners were killed and that no attempt has been made to ascertain or to punish the guilty parties. There is no doubt that what are commonly

known as strike breakers, gunmen or thugs were brought to that county thoroughly equipped with arms and ammunition, and perfectly willing to shoot with or without provocation.

It is not needful to report further facts about this unfortunate condition of economic life, wherein so many criminals have gone unwhipped of justice. That the election of officers by the people has something to do with the administration of justice can not be denied. Where the territory is unionized and the officials are elected by the vote of the union miners, they naturally have a friendly feeling for the United Mine Workers. Where it is non-union and they are elected by men who are opposed to the union, a like condition of mind necessarily exists.

The inquiry will naturally arise, if the Commission is unwilling to fix ultimate responsibility for the destruction of life and property, leading to strikes, riot, tumult and disorder, how it justifies such a finding. The disregard of the civil rights of American citizens, as commonly understood by those who are versed in our principles of government, the breaches of the criminal law of the land, the frequent immunity from punishment, and the occasional unjust conviction of men, has heretofore been viewed exclusively from an altruistic standpoint.

The Commission would impress upon the law-making power of the land and the common sense of our people this ever to be remembered fact: All justice is human and fallible. Always its enforcement depends upon the education, environment and heredity of the people who are called upon to enforce it. It will only approach perfection when the intelligence, the judgment and the conscience of men are educated more and more toward higher ideals. It would not be fair to omit from the equation in West Virginia the outlook of the people upon what is commonly called law and order. It would be unjust to fix the responsibility of non-union operators by charging them with the effects of racial characteristics.

Justifying a Feud.—It was not the intention of the Commission to quote evidence in this report, but the idea it entertains can be gleaned by relating a conversation had with two bright fifteen-year-old boys of Anglo-Saxon origin, engaged in social work, and living in eastern Kentucky. Asked how they explained that a religious people such as they were could justify the feud, the explanation diffused a startling light upon the situation. It was this: "I become fearful that my neighbor is going to kill me. I have no desire to take his life, but I have a right to defend my own. It is his life or mine, and so I kill him. Fear that he may kill me constitutes the right of self-defense, even to the taking of his life."

That fairly expresses the outlook. What goes to the defense of one's life goes also to the defense of one's home and one's property. It is a mistaken idea, but it accounts for much of the trouble where all men go armed. On the other hand, you may take a union organized territory such as Williamson County, Illinois, and so strong has grown the opinion of the rights of unionism that its people, however, mistakenly, quite honestly believe that they have a right to resist, even to the taking of life, the interference by anyone with the privileges of organized labor. In either district the enforcement or lack of enforcement of the law shocks the moral sensibilities of that great body of Americans who believe that the courts and the police officers are to be the preservers of our rights and the defenders of our liberties.

But while these ideas remain instilled in the minds of these men and are not removed by educating them along different lines of thought, however much it may be and should be deprecated, the judgments of the courts and the verdicts of juries will speak the common conscience of the multitude over whom they preside. For years this irrepressible conflict between the undoubted right of a man to operate his property as he pleases in America and the undoubted right of men to organize for collective bargaining with reference to wages and working conditions has gone on. Principles of government, acknowledged, admitted, have been tossed into the scrap heap every time they have faced actual conditions. The law has been, is now, and ever will

be but the average of the judgment and conscience of the community.

From each of these two sides the Commission sought helpful suggestions with reference to minimizing, and in time ending, these denials of civil rights leading to breaches of the criminal law. So obsessed with the eternal verity of its particular right has each side been, that the only solution has been the destruction by legislative enactment of the other fellow's right.

The non-union operators and miners have suggested: "Break up the United Mine Workers of America and all will be well with the world."

The United Mine Workers of America have said: "Unionize all the mines and peace will brood over a war-worn industry."

Each Side Wants Peace by Suppressing the Other.—Each admits the principle in which the other believes, but each is quite satisfied that peace can only come by killing the other fellow's principle. Unfortunately, the Commission cannot kill principle. It is not a lord high executioner authorized to take anybody's statement as to what will produce peace, and either destroy the United Mine Workers of America or force the unionization of all the mines. The Commission has been compelled to consider the viewpoint of each and to report upon these well-known facts what, if anything, can be done to spell peace and prevent strikes or lockouts.

The condition resembles the conflict between the definition in the Declaration of Independence concerning human rights and the then clearly constitutional right of human slavery. The great mass of those arrayed upon either side were unwilling to compromise or adjust. It was permitted to go on until the agony of a fraternal war solved the problem. It is to be hoped that we have learned wisdom by experience. There is a patriotic side to this question which is of more compelling force in the mind of the Commission than even the economic one. A democracy that cannot spell peace with justice will sooner or later be succeeded by a government that will spell peace regardless of justice. The owners of these mines have a right to operate them as they please, if they be but a mere business enterprise. But the Commission believes that absolutely necessary as their output is, not only to interstate commerce but to the comfort of the whole people, it is their patriotic duty to make some personal sacrifices in the interest of the common weal, a principle equally applicable to the United Mine Workers.

The United Mine Workers of America have a right to exist. They have a right to bargain collectively as to wages and conditions under which they will labor. They have a right to place the authority for the determination of these questions where they will. They have a right to work or to refuse to work. They have a right, peaceably and by persuasion, to endeavor to swell their ranks.

In this clash of right, every red-blooded American in the industry should yield as much as is necessary of his unqualified legal right to the end that the mining industry may be owned and worked by loyal citizens, whether native born or naturalized, in the spirit of fairness toward the public and for the preservation of the principles of civil rights as now understood by the American people. It is the conflict between these rights that results in strikes and lockouts. It is the unwillingness to present controverted points to any sort of arbitration. Compulsory arbitration is not only impossible but inadvisable. Voluntary arbitration is desirable.

Some difficulty has confronted voluntary arbitration in the past as has confronted the Kansas Industrial Court. No difference on which side of the line one may stand, one naturally fears, and unjustly so, the submission of questions to even voluntary arbitration when up to the present time no yardstick has been prepared by which the arbitrators are unqualifiedly required to measure the facts. One of the evils of today in American life is government by discretion. The sooner we return to a government of laws and not of men, the sooner we may expect stability and peace. No individual man is willing to be tried by discretion. None can find fault by being tried by laws which he himself has helped to make.

Urges Voluntary Arbitration.—It is the opinion of the Commission, therefore, that certain standards should be adopted under which controversies touching the same should be submitted to voluntary arbitration. The Commission is of the opinion that an honest finding of the facts measured by the standards so set up will have such force of public opinion back of it as to compel its adoption and prevent cessation of work in the industry.

The Commission has considered the advisability of setting up a code by which through arbitration many of the questions involved might be tried, but it has reached the conclusion that these principles would far better be worked out by the operators and the miners and include in their contracts, as they would vary certainly from region to region and perhaps from mine to mine.

If industrial peace is to be hoped for—a peace that looks toward continuity of employment, stabilization and stimulation of production—then some method must be found to guarantee, as near as fallible human judgment may, equally exact justice to capital, to labor, and to the public. There must be one yardstick adopted by which all controverted questions are to be measured. Public interest demands that certain fixed principles shall be recognized by both capital and labor as this yardstick.

(1) No contract is of any valid binding force and effect in America which has not been freely and voluntarily entered into. No law could, therefore, be enacted compelling the making of contracts or fixing the terms and conditions thereof. But when once executed, contracts should be mutually binding upon the parties thereto, and each should be required to preserve scrupulously the same or be responsible to the other party in damages for the breach thereof.

(2) The right of a man to work when, where, for whom, under what conditions, and at what wage he chooses, so long as he elects to assert his individual right, must never be interfered with and the State must furnish him protection and peace while he exercises this right.

(3) In a free government men have a right to combine themselves together in organizations for collective bargaining with reference to terms and conditions under which they will work. They must exercise this right without force and intimidation, gathering into their ranks those who voluntarily desire to become members of the association, but they must not by coercion, duress, restraint, intimidation, or any species of violation of the criminal laws of the land, interfere with the right of the man who chooses to dispose of his time individually.

(4) When society consents to the formation of corporations of capital to engage in business, and grants the right of labor to bargain collectively with reference to wages and working conditions touching any of the prime necessities of life, and particularly with reference to that great public necessity, coal, society has a right to fix a limitation beyond which it will not permit either these *de facto* or *de jure* organizations to go. The public welfare is the thing to which private interests, as exercised through corporate organizations, must yield a certain measure of the inherent right of the individual. Therefore, a corporation, which is a creature of the state, must not be permitted to break up a *de facto* organization of labor in other ways than by argument and advice. Nor must it be permitted to prevent its employees from voluntarily organizing for lawful purposes. On the other hand, labor organizations must not attempt in other ways than by peaceful argument to induce men to join the union.

(5) Society ought not to shift its moral responsibility to look after its unfortunates onto individual persons, firms and corporations, but government ought not, and presumably does not, authorize the combination of capital, whether into partnerships or corporations, without the implied duty upon the part of such partnerships and corporations to pay to the humblest of its workers who is able-bodied, willing and competent, and who gives a good honest day's work in an occupation that may properly be considered a man's job sufficient wage to enable that person and his family to live in accordance with the standards of American life, and to pay in addition thereto for skill and experience and with reference to the irregularity

of employment, and when thus it has provided for skill and experience, no organization or group has the right to hamper the initiative of the individual, preventing him from making all the money he can.

Recognition of the principle that wages should be sufficient to maintain an American standard of living does not imply approval of any particular current estimate of its cost, or that any stated income will insure such a standard in different localities where not only the cost of necessities but the habits and traditions of the people may differ in varying degrees.

(6) The necessities of life are not obtainable from year to year at even a fixed price, eliminating the fluctuating purchasing power of the dollar. These fluctuations affect the industry no more than they affect the general public. The general public, commonly called the consumer, has a right to demand of its government that it shall not freeze in the midst of an abundance of coal. Unless, therefore, the capital and labor invested in this industry shall of its own volition adopt methods that will furnish to the public coal when needed, an outraged public sentiment will furnish the supply by either the army or the penitentiary.

When negotiations are pending looking to a new contract, sixty days before the date thereof the President of the United States should be informed of the facts and principles in controversy, and should appoint some disinterested person to make a report upon these facts and principles so that the public may know whether the operator is receiving a reasonable return upon his investment, the wage earner a living commensurate with American standards, and if not, who is to blame.

(7) When contracts have once been voluntarily entered into, the enforcement thereof should not be left to strikes or lockouts, but the industry itself should provide boards of arbitration—local and appellate—to dispose speedily of these causes in accordance with the terms of the contract and the principles herein set out.

Condemns Violence on Both Sides.—The Commission calls the attention of certain persons in America to a very wise statement made by the Apostle Paul when he said, "All things are lawful to me, but all things are not expedient." Men have, of course, the inalienable American right to go into strange communities and diagnose the evils under which the community suffers and offer remedies for a cure. But many times it is not expedient to exercise this right. Men not connected with the industry have no right to make inflammatory speeches leading to the use of violence, nor have operators the right to hire gunmen under mere pretense of protecting their property. Both actions are to be condemned. Unionism must justify itself by its wise, sane, conservative and constructive conduct; not by force, threats or intimidation. Non-union operators must justify themselves by the satisfaction of their workmen with their wages and living conditions and not by the use of force and arms.

Notwithstanding the decisions of the Supreme Court of the United States that the so-called "yellow-dog" contract is legal, the Commission is of the opinion that it is a source of economic irritation, and is no more justifiable than any other form of contract which debar the individual from employment solely because of membership or non-membership in any organization. The right of an employer to discharge for disloyalty, dishonesty and incompetency or other unlawful conduct should not be abridged, but he should not be permitted to blacklist a discharged laborer for any other reason than disloyalty, dishonesty or unlawful conduct.

Rights of General Public Must Be Preserved.—As heretofore reported by the Commission there is a vast difference between the rights of individual men and the rights of artificial persons, in the form of *de facto* or *de jure* corporations. These artificial persons are not individual citizens of the Republic. They derive their right to exist from the common consent of the people of this country. In their dealings with each other they must, therefore, take into consideration the fact that the general public has some rights which they are bound to respect. They cannot combine to prevent the mining of coal nor can they agree to such outrageous prices as will work a distinct hardship upon

the citizen. They must deal justly with each other and with the public, making their contracts so as to get a fair return to the owner, a wage commensurate with American ideals to the laborer, and a steady output to the American people.

Regardless of what the law has been in the past, it is the opinion of the Commission that the Congress of the United States must compel full publicity from both operators and United Mine Workers, upon forms prepared and furnished by some governmental agency to the end that the people of America may determine whether they will longer permit, even under governmental supervision, the existence of these artificial persons. They will gladly do so if the corporations work no injury to the common weal, but they will resent any effort to exploit the people by their corporations, *de facto* or *de jure*, or by the united efforts of these corporations.

The Commission reiterates that it is seeking something better for the future than the mere fixing of responsibility for past violations. It does not minimize the gravity of all sorts of crimes which have taken place. It cannot too strongly condemn the custom of permitting either operators or miners to furnish deputy sheriffs, policemen, or other public officials not paid out of the public treasury. That state and local government has not risen to the level of the average idea of justice in America which has not both the will and the power to preserve the life and the property of its citizens.

The Commission condemns equally the lax local government which has seemed to render it necessary for the owner

of property to police it at its own expense and in the event of strikes to bring in professional strike breakers, who are frequently better gunmen than they are laborers, and the exercise of that right which inherently belongs to an American citizen, namely that of a stranger voluntarily walking into a community, hiring a hall, and giving that community a lecture on what its rights and duties are. Many good-intentioned people, seeking to serve the common weal, have unwittingly contributed more to crime than to character making.

And finally, if neither the patriotism, private conscience nor business common sense of the industry shall lead all persons engaged in it not only to observe the law but to help enforce the law; and if state and local authorities shall be impotent in prosecuting and convicting violations thereof, then it is the solemn duty of the Congress of the United States to assume jurisdiction over these American rights, bringing the full power of the Union to their preservation by the prosecution and conviction of all persons, whether high or low, who shall dare to violate them.

The legislative, judicial, and executive branches of this government must not permit a union of operators, a union of miners, nor a union of both to become greater than the Union of the States.

Attest:
EDWARD EYRE HUNT,
Secretary.

JOHN HAYS HAMMOND, Chairman,
THOMAS R. MARSHALL,
CLARK HOWELL,
GEORGE OTIS SMITH,
EDWARD T. DEVINE,
CHARLES P. NEILL.

Pinchot Letter to Coolidge Suggests Means To Save Public from Higher Coal Cost

With the anthracite strike on the way to a termination Governor Pinchot on Sept. 9 wrote a letter to President Coolidge, suggesting a means whereby the public need not shoulder the \$32,250,000 increase in the production cost of coal necessitated by the 10-per cent wage increase. During the Harrisburg conference the Governor said that the wage increase would result in an added cost at the mines of 60c. a ton to anthracite, and that 10c. of this should be absorbed by the operators and the remaining 50c. by the transportation and distribution agencies. The operators in replying to his proposal said this cost would be 80c., 75c. of it being due to the wage increase and 5c. a ton to the adoption of the eight-hour day. The Governor's letter follows:

"Now that the danger of a strike in the anthracite field is disposed of for two years, I would like not only to thank you again for your telegram of congratulation but to express my very great appreciation of your public approval of the terms of settlement which I suggested, and of the very valuable information which was supplied to me by the U. S. Coal Commission at your direction.

"Both miners and operators deserve great credit for their courtesy, their readiness to consider each others' points of view and their patient willingness to stay on the job. I emphasize the latter particularly because I doubt if any of them had the slightest expectation when they came to Harrisburg that the negotiations would last more than a day or two, or that the strike would be settled.

"A supply of anthracite to the consumer for the next two winters having thus been assured, the next question is that of price. The total legitimate increase in the cost of coal under the terms of the settlement is about 60c. per ton. Of this amount not less than 10c. should properly be taken up by all the operators; many of whom could absorb the whole of the 60c. increase and still make abundant profits.

"In fairness the remainder of the 60c. should never reach the consumer. It is certain, however, that this amount, and probably much more, will be exacted from consumers unless public action is taken to prevent it. Accordingly, since you were good enough to indicate that suggestions from me concerning anthracite would not be unwelcome, I am writing to suggest that real advantage to the public would result if the Interstate Commerce Commission would take up and consider anew the rates charged for the trans-

portation of anthracite coal, with a view to reducing them if justification for such reduction should be found.

"On my part, I propose to ask the Pennsylvania Public Service Commission to consider anew the reasonableness of all freight rates on anthracite within the borders of Pennsylvania.

"I realize that the action of national and state bodies having authority over freight rates on anthracite coal cannot alone solve the problem of fair cost to the consumer. Other factors also have weight, such as efficiency in operating the mines and reasonable profits in distribution. It would greatly assist the public in reaching sound judgments in these matters if the findings of the U. S. Coal Commission on profits and costs in mine operation and in wholesale and retail distribution were made public in great detail at the earliest possible moment. This information will be of the greatest use to me as to others in making plans to protect the public interest.

"The margins and profits of wholesalers, brokers, jobbers and retailers are mainly local matters, which must be dealt with as such. Accordingly, you will, I am sure, be glad to know that I am preparing to invite the Governors of all anthracite-using states to go into this matter with me.

"I am exceedingly glad to tell you that the mining of anthracite is likely to be resumed before the 20th of this month. You will realize as fully as I do the desirability of securing at the earliest possible moment whatever protection can be provided for the consumer against any undue and unnecessary increase in the cost of coal.

"Since the public is a deeply and properly interested party in this matter, and since public opinion will have so large an influence in securing justice, I have taken the liberty of making this letter public in the confident belief that I shall have your approval in doing so."

John L. Lewis, president of the United Mine Workers, sent a letter Sept. 10 to President Coolidge supporting the suggestion of Governor Pinchot that the Interstate Commerce Commission investigate anthracite freight rates. The Governor, Mr. Lewis said, has placed his finger with unerring precision "upon the method by which the consumers of anthracite may be given substantial relief from excessive prices, and the possibility of a future increase."

"The proposals of Governor Pinchot," Mr. Lewis added, "are constructive, reasonable and practicable, and you would be conferring a boon upon the people of anthracite-consuming states if the influence of your high office were directed in support thereof."

Union Leaders and Operators Accept Pinchot's Terms And Sign Two-Year Agreement

The anthracite peace proposal of Governor Gifford Pinchot of Pennsylvania was accepted at Harrisburg by the representatives of the operators on Sept. 6 and by the miners the next day. On Saturday, Sept. 8 the form of the agreement between mine workers and mine owners was drafted. The agreement was indorsed by the union scale committee shortly thereafter and Sept. 17, set as the time for the ratification meeting of the tri-district convention at Scranton.

It is now expected that the strike will formally end Sept. 19, when the men return to work, Sept. 18 being election day. It is probable that the contract which will be drawn upon the form of the agreement will be signed at Harrisburg in the presence of Governor Pinchot on Sept. 19 or 20, probably after mine operations have been resumed.

The contract will run for two-years and incorporate the twelve clauses of the agreement, which include the four Pinchot points and other points raised by the miners at Atlantic City. The four points of the Pinchot proposal are the eight-hour day, the 10-per cent wage increase for all classes of mine workers, recognition of the union through permission to have a union man at the pay windows to collect union dues and recognition of the principle of collective bargaining.

S. D. Warriner, chairman of the General Committee of the Anthracite Operators and spokesman during the conference for the operators, issued the following statement:

"The operators are relieved that a coal shortage has been avoided. While they are of the opinion that conditions did not justify wage increases with added burdens on the public and that the principle of arbitration should be the basis of public protection, nevertheless they were unwilling to assume the responsibility of a protracted suspension in the face of the Governor's proposal."

The drafting of the agreement was as tedious a job as the discussion of the four points of the Governor. On Sept. 6 the operators accepted the Governor's terms, abandoning their requests for a long-term contract if an uneconomic wage was to be provided and also the question of arbitration, temporarily and so far as the present strike is concerned. The following day the miners dropped their demand for the check-off and for an additional increase for day laborers beyond that of the 10 per cent increase for all classifications of mine workers. The miners submitted the question to the union scale committee which indorsed acceptance of the peace plan.

Operators' and miners' representatives, called in by Governor Pinchot in an endeavor to settle the anthracite coal situation, following a recess taken Sept. 1, resumed their efforts to smooth out their differences at the Capitol on Wednesday. The Governor, acting as intermediary, carried specific statements from the miners to the operators and from the operators to the miners. There was no joint session on Wednesday, or on Thursday.

Text of the Two-Year Agreement

Here is the full text of the new two-year agreement signed by representatives of the miners and operators:

"This agreement, made this eighth day of September, 1923, between Districts 1, 7 and 9, United Mine Workers of America, parties of the first part, and the anthracite operators, parties of the second part, covering wages and conditions of employment in the anthracite coal fields of Pennsylvania, witnesseth:

"The terms and provisions of the award of the Anthracite Coal Strike Commission and subsequent agreements made in modification thereof, or supplemental thereto, as well as the rulings and decisions of the Board of Conciliation, are hereby ratified, confirmed and continued for a further period of two years ending Aug. 31, 1925, except in the following particulars, to wit:

"(1) The contract rates at each colliery shall be increased 10 per cent over and above the rates established

under the award of the U. S. Anthracite Coal Commission in 1920.

"(2) The hourly, daily or monthly rates of outside and inside company men, working on the basis of an eight-hour day, shall be increased 10 per cent over and above the rates established under the award of the U. S. Anthracite Coal Commission in 1920.

"(3) The hourly, daily or monthly rates of pumpmen and engineers formerly working a twelve-hour cross shift, and changed to an eight-hour basis under the award of the U. S. Anthracite Coal Commission in 1920, shall be increased 10 per cent over and above the rates established by the Board of Conciliation in conformity with said award.

"(4) The hourly or daily rates of consideration miners and consideration miners' laborers shall be increased 10 per cent over and above the rates established, under the award of the U. S. Anthracite Coal Commission in 1920.

"(5) The rates paid contract miners' laborers shall be increased 10 per cent over and above the rates established under the award of the U. S. Anthracite Coal Commission in 1920, said increase to be paid by the operator and miner by adding 10 per cent to the portion of the rate now assumed by each.

"(6) Outside and inside company men working on the basis of a day in excess of ten hours, shall be placed on the basis of an eight-hour day. The rate of pay for an eight-hour day shall be adjusted in the same manner as rates were adjusted for hoisting engineers and pumpmen who were changed from a twelve-hour day to an eight-hour day in 1920, subject to the same increase of 10 per cent provided for other company men under clause 2 hereof.

"(7) Outside and inside company men working on the basis of a nine- or ten-hour day shall be placed on the basis of an eight-hour day. The rates of pay for the eight-hour day shall be the rates for the nine- or ten-hour day paid under the agreement of 1916, plus \$1.80 per day for outside employees and \$2 per day for inside employees, plus 17 per cent and subject to the same increase of 10 per cent provided for other company men under clause 2 hereof.

"(8) Monthly men coming under the agreement of Sept. 2, 1920, and working on a basis in excess of eight hours per day shall be placed on the basis of an eight-hour day. The monthly rates for the eight-hour basis shall be the monthly rates paid under the agreement of May 5, 1916, plus \$54 per calendar month for outside employees and \$60 per calendar month for inside employees, plus 17 per cent (except where modified by ruling of the Board of Conciliation) and subject to the same increase of 10 per cent provided for other company men under clause 2 hereof.

"(9) The colliery rate sheets of the different collieries shall be brought up to date, shall be signed by the company officials and the mine committees, and shall then be filed with the Board of Conciliation. In case of dispute as to the correctness of any rate the rate shall be determined by the board, after hearing. In such cases the burden of proof shall rest with the party taking exception to the fixed rate.

"(10) A grievance referred to the Board of Conciliation shall be answered within fifteen days and shall be heard within thirty days from date of filing with the board. Decision shall be rendered by the board, or case shall be referred to an umpire, within thirty days after hearing. In case of reference to an umpire, the decision of said umpire shall be rendered within thirty days from date of reference.

"(11) Rates for new work, such as opening a seam of coal, shall be made collectively as between the Mine Committee and the company officials on the basis of the standard recognized rates paid for similar work under similar conditions in the mine in question or adjacent mines. In case of disagreement the matter shall be adjusted through the Board of Conciliation in the manner now customary. Pending decision by the board, work shall proceed at rates set by the foreman and which shall not be less than the

standard recognized rates aforesaid. No contracts shall be made with individual employees at less than the prescribed scale rates or not in keeping with customary practices. This section shall not be construed to deny to the operator the right to change the method of mining.

"(12) The Board of Conciliation is hereby authorized to undertake and complete a thorough study of all wage scales before the expiration of this contract and submit the same to the next joint conference. If the Board of Conciliation shall, by unanimous vote, recommend the adjustment of any inequities or inequalities in wage rates during such study, the adjustment shall take effect on a date set by the board."

Coal Commission Issues Warning Against Pyramiding by Middlemen

Warning against the operations of speculative jobbers in the event of a cessation of mining Sept. 1 was given in a statement issued Aug. 29 by the U. S. Coal Commission. Investigations have disclosed, the Commission stated, that prices were forced up last winter by the multiplicity of transactions by middlemen, which resulted in a pyramiding of profits.

The Commission's statement was intended to put the public on its guard against runaway fuel prices if the efforts to avert a strike fail.

"The U. S. Coal Commission," said the statement, "believes it opportune to make public more details on the subject of pyramiding middlemen's profits, described in the July 5 report by only a single paragraph.

"The Commission's inquiry regarding the source of high-priced anthracite sold during the winter of 1922-23 leads to the conclusion that the speculative jobber or wholesaler was a prime cause of the extremely high premiums paid for anthracite during the recent shortage in New England, as well as in other parts of the country.

"Under normal conditions wholesalers have a proper place in the distribution of coal. They furnish an outlet for the coal of small mines whose total tonnage is too small to warrant the maintenance of a selling organization. In times of normal market, competition among wholesalers for the operators' available tonnage on the one hand and for the consumers' and retailers' trade on the other keeps margins and prices low and commensurate with the services rendered as distributors of coal. In time of a panic or sellers' market, however, the independent wholesalers tend to become speculators, and buy and sell among themselves, thereby pyramiding margins and advancing prices without rendering any equivalent service in bringing the coal nearer to the consumer.

"The wholesalers whose activities resulted in premium prices last winter are, nominally at least, not directly connected with the mines producing the coal, although there are a considerable number of cases in which operators and wholesalers, while separate and distinct corporations, are related through interlocking stock ownerships, interlocking directorates and interlocking officers. In some cases the interrelations extend to a chain of operators and wholesalers.

"In times of sellers' market anthracite is passed from one to another of these closely related interests, each taking a profit on the transaction with the result that wholesale margins are pyramided and the consumer pays extremely high prices and profits to a group of related interests. In other cases the pyramiding results from speculative buying and selling among wholesalers who are separate and independent. Many cases of pyramiding of margins both by related interests and among really separate and independent wholesalers have been traced by the Commission.

"Anthracite coal especially yields itself to speculation among wholesalers whenever there is an interruption of production due to strikes, railroad disability or any other cause. In tracing carloads of high-premium anthracite coal purchased by New England retailers last winter it was found that as many as four wholesale purchases and sales sometimes intervened between the mine and the retailer. More than half of the 750 cars of anthracite coal of domestic sizes traced passed through the hands of only one

wholesaler at margins varying from 20c. to \$3 per gross ton. Margins frequently taken were 50c., 75c., \$1.25, \$1.75 and \$2.50 per gross ton, the majority of margins being between 50c. and \$1.25 per ton.

"A considerable proportion of the cars traced, however, went through the hands of two wholesalers at margins varying from 25c. to \$4.75 per ton. In the case of the carload on which \$4.75 was taken the first wholesaler took 50c. and the second \$4.25 per gross ton.

"Total margins taken by wholesalers on cars passing through the hands of three jobbers ranged from 68c. to \$4.03 per gross ton. On two cars sold to the same retailer for which the total of margins taken was \$4.03, the first wholesaler took 15c., the second \$2.73, and the third \$1.15, and on a third car for which the total margin was \$4.03 the margins taken by three jobbers were respectively 15c., \$2.90 and 98c. per gross ton. A loss of 50c. per ton by the third wholesaler intervening in the sale of one carload, was the only loss reported by wholesalers on the 750 cars of domestic sizes traced.

"On a small number of cars passing through the hands of four jobbers, the total margins taken on individual cars ranged from \$1 to \$2.25 per gross ton. On the car for which margins amounted to \$2.25 per ton the first wholesaler took 25c., the second 40c., the third 35c. and the fourth \$1.25 per ton.

"Some mining companies were found to have had special arrangements with wholesalers by which the mine billed the coal to the wholesaler at the prices approved by the Pennsylvania Fair Practices Committee with the understanding that if the wholesaler sold the coal at a price above the mine price billed plus a stipulated wholesale margin or commission, the wholesaler remitted the balance to the operator. Other mining companies sold coal to individuals, in some cases their own officers, at prices agreed upon with the Fair Practices Committee. These individuals then sold the coal to other wholesalers at higher prices. Such practices applied especially to shipments to destinations outside the State of Pennsylvania, thus indicating the ineffectiveness of state regulation of prices at the mine over coal entering into interstate commerce.

"Should a stoppage of mining occur on Sept. 1, it will accentuate the already panic demand for anthracite and unless the buyer and the retailer representing him learn from past experience unscrupulous wholesalers will have another opportunity to repeat their speculative activities of last fall and winter on any anthracite coal that may be on the market after Sept. 1, as well as following the resumption of mining. In the absence of any definite regulatory powers over either mine prices or wholesalers' margins on the part of the state and federal authorities, the extent of such activities and the amount of premium added by wholesalers will depend largely upon the willingness of the retailer and the consuming public to pay the prices demanded. It is only with the retailer's consent that the middleman may receive as much in margin as the coal miner receives in wages from the same ton of anthracite."

THE COAL COMMISSION has been meeting daily both morning and afternoon working on its final reports which are to be submitted on or before Sept. 22, when the life of the Commission will expire. The final report of the Commission not only will be of particular interest to the bituminous industry but also will carry general conclusions and recommendations applicable to anthracite and bituminous alike. It is expected that the Commission will issue previous to its final report certain sectional reports bearing on specific phases of the problems on which it was directed by Congress to make inquiry.

SEVERAL BRIEFS WERE FILED with the Coal Commission last week by the Bituminous Operators' Special Committee. Among the most important was one regarding transportation of coal, in which it was stated that the problem of obtaining an even flow of coal with supply and demand cannot be solved merely by improving transportation machinery without controlling seasonal fluctuations in demand, interruptions of production through strikes, etc.

Miners' Union Attacks Civil Rights Report

In a statement issued Sept. 10 attacking the report of the U. S. Coal Commission on the subject of violation of civil rights in the coal-mining industry the United Mine Workers of America says the report reads like a well-prepared brief in behalf of the non-union bituminous-coal operators of West Virginia and northeastern Kentucky. "Those non-union operators should immediately hold a meeting and give a rising vote of thanks to the Commission for that report," says the statement. "In the first place, the Commission lacks but one hair of giving approval to the employment by these non-union coal companies of private armed guards, thugs and gunmen, in spite of the fact that these desperadoes roam at will over the mountains of West Virginia and Kentucky with a roving commission to assault, beat up, blackjack and shoot members of the United Mine Workers of America who dare to suggest that the employees of these companies join the union.

"The Commission denounces union organizers for daring to go into these non-union fields and ask unorganized men to join the union. In other words, the report clearly attempts to place upon the United Mine Workers of America the blame for what happens in these non-union fields. Why did not the Commission declare that non-union coal companies have no right under the law or the Constitution to use force and coercion to prevent their men from voluntarily asserting their right to affiliate with a labor union?"

"The Commission devoted much space to telling of crimes which it says were committed by union miners, but it did not even mention the scores of crimes of company thugs and gunmen that were brought directly to the attention of the Commission by the United Mine Workers. . . .

"One of the very significant statements in the report says that 'the United Mine Workers of America have paid more than \$400,000 in damages for the destruction of the Willis Branch Coal Co.'s mines.' The United Mine Workers of America never paid any such sum for damages for the destruction of the mines of the Willis Branch Coal Co. or any other company. If the Commission's fund of information upon which it based its conclusions is not more authentic on other points than it is on this one the report is not of much value from the standpoint of facts and the public is not going to get value received for the \$600,000 of the people's money which the Commission has spent."

U. M. W. Allege Communist Move to Control Unions and Overthrow U. S. Government

How the Communist International of Moscow, working through the Communist revolutionary movement in America, is trying to gain control of the labor unions, and by that means overthrow the Government of the United States, is set forth in a series of six articles made public by the United Mine Workers of America at Washington this week. They reveal the efforts made to wreck the trade union, particularly the Mine Workers organization, the purpose of the exposé being to inform the American people of the scope and purport of the "hostile and inimical movement being carried on within their midst."

The overthrow and destruction of the government, with the establishment of an absolute and arbitrary dictatorship, and the elimination of all forms of popular voice in governmental affairs, is being attempted in a more gigantic scale, with more resolute purpose, and with more crafty design, than at any time in the history of the nation, it is declared.

The organization in this country is composed of more than 6,000 active leaders and lieutenants, and approximately 1,000,000 members, adherents and sympathizers, scattered in every state and province of the United States and Canada.

Efforts of the Communists to get control of the miners' union have continued since last year's strike ended with the agreement at Cleveland. In the first two months of this year these efforts centered on the proposition of bringing about an "outlaw" strike on April 1; later to drive a wedge into the United Mine Workers through the advocacy of government ownership of mines, in connection with which

it is declared the miners' union has not approved or adopted any plan for nationalization of the mines but adds that a committee was appointed to make a report with recommendations at the next convention of the union to be held next January.

The Herrin massacre is elaborated upon by the miners' organization, saying it was engineered by Communist agents, who according to their own statements, were engaged for seven weeks in preparation for the outbreak.

The Communists have attempted to "bore from within" organizations wherever possible in order to further their ends, having been particularly active against the United Mine Workers, because, besides being the largest single labor organization in the country, it is the nearest approach, in their opinion, to a "one big union," which is their conception of a labor union and their objective for all labor unions. The same tactics have been used for four years to seize and control the American Federation of Labor, the railroad labor unions, and the various other trade groups.

Working partly in the open, the Workers Party of America, it is charged, is another revolutionary organization, created under instructions from the Communist International, by the Communist Party of America. It is known as the "legal" party and its primary purpose is to shield the "underground" or "illegal" party. The mission of this party, it is declared, is fundamentally the same as that of the Communist Party of America.

Another organization, assisting the two revolutionary parties, as one of their direct subsidiaries, is the Trade Union Educational League. This League, it is charged, is cultivated and promoted by the Communists and Workers Parties and is the direct instrumentality of Lenin and Zinoviev, of the Communist International, and Losovsky, of the subsidiary Red Trade Labor Union International, for amalgamating the labor unions into the world revolutionary movement of the Communists.

The Communists are hopeful that a nationwide strike of coal miners will take place next April, and with that end in view agents are working among the miners in Pennsylvania, Ohio, Indiana, Illinois, West Virginia and the Southwest.

Unconstitutional to Regulate Prices and Profits, Say Bituminous Operators

Regulation of prices and profits in the coal industry would be unconstitutional in normal times, according to a statement filed Sept. 1 by the Bituminous Operators' Special Committee with the U. S. Coal Commission. The Constitution of the United States, says the brief, forbids regulation of such a private competitive industry as coal mining, except in times of war or national emergency, citing in proof the decision of the Supreme Court on the Kansas Industrial Court Act, where Chief Justice Taft referred to coal mining as a business which could not be regulated.

The brief has special reference to a statement on accounting and finance filed with the Commission by the United Mine Workers last June. While this latter dealt with the anthracite industry in particular, the bituminous operators point out that the public is likely to make no sharp distinction between soft and hard coal.

The miners proposed plans for financing the coal industry that would involve eventual nationalization of the mines. Prior to this nationalization, it suggested that the mines be so regulated to give a 6 per cent return on the "investors' sacrifice." The operators contend that these proposals involve three fundamental fallacies: (1) That investors in coal properties are not entitled to profit by increase in the value of their property; (2) that regulation of profits in the coal industry is possible and desirable; (3) that accounting considerations may be made to govern in determining the facts of the industry. The first of these, according to the operators, is in reality a suggestion that the institution of private property be abolished, for the cardinal element of that institution is the fact that it allows the owner to benefit by increase in property value. Moreover, they propose that no compensation be given for possible loss and no reward for risks run, efficiency of management or good business judgment.

Production and the Market

Weekly Review

Settlement of the anthracite strike on the basis of Governor Pinchot's original four points is now assured and the wages and prices have been pegged up for two years. The coal trade is now waiting to see what the Governor can accomplish in cutting freight rates and distributor's margins.

With few exceptions, and then only in slight flurries, did the coal market in any part of the country show any improvement which could be attributed to the suspension of anthracite mining. Inquiry for soft coal increased in various sections, but prices were affected but little. For the third consecutive week *Coal Age* Index shows a slight advance in the average price of soft coal, registering 205 on Sept. 10, an increase of one point, with an average price of \$2.49.

COUNTRY WELL PREPARED FOR STRIKE

The country was in excellent condition to forego the trouble which would have been occasioned by a much longer strike of the miners. There are upward of 57,000,000 net tons of soft coal in consumers' reserves and the output of anthracite during the coal year to Aug. 31 is estimated at 42,521,000 net tons, the largest production for any corresponding period since 1918. Production of hard coal in five days during the last week before the strike was 1,896,000 net tons.

Another high record for weekly output of soft coal was recorded during the week ended Sept. 1 with production amounting to 11,633,000 net tons, an increase of 250,000 tons over the previous week, which was the weekly record of that time. The output for the first 207 working days of 1923 was 368,706,000 net tons, which has not been exceeded since 1918, when it was 393,093,000 tons, and in 1917, when production amounted to 368,651,000 tons.

The ending of the anthracite trouble and the feeling that the danger point has been passed placed householders in the Middle West on easy street, with the result that there is no rush for any of the domestic

fuels. Buying is slow in New England and even retail dealers have plenty of coal on hand to meet a possible emergency. Shutdowns and curtailments in industrial plants are frequent. Inquiry for bituminous screened coals fell off somewhat. The week's idleness of the anthracite mines failed to create any considerable uneasiness among the dealers or consumers. It was estimated that approximately 75 per cent of hard-coal consumers had at least a part of their winter's fuel in their bins and that the balance could use substitutes. With the strike apparently settled wholesale and retail

LAKE COAL DUMPED
(Net Tons)

	Week Ended Sept. 3	Season to Sept. 3
Fuel	977,385	18,859,934
Cargo	63,494	982,346
Totals	1,040,879	19,842,280

dealers expect that within a comparatively short time production will have been sufficient to supply all orders.

Inquiries for coke were numerous and considerable buying was reported by some producers. In some instances the larger sizes were asserted to be sold up. Inquiries of producers continued as far south as Birmingham, Ala. Buying of heating coke by Eastern dealers is fairly active.

(a) Subject to revision. (b) Revised from last report.

Chicago Trade Is Normal

Nothing has excited the coal trade in and around Chicago lately. The blow-up of the anthracite strike plus assurances from at least one official source has made householders feel that there is plenty of coal on hand, more ready to come, and nothing threatening to boost the price of most domestic coals much. The general result is that no rush is noticeable for any sort of domestic fuel. Yards are fairly well stocked with anthracite, Illinois and Indiana lump and Eastern smokeless at reasonable prices. Steam buyers are disappointed, as they have been counting on lump demand to lower the price of screenings.

Better conditions are noted in the retail call for coal in St. Louis, although this is not for anthracite, smokeless coal or coke. The greatest call seems to be for a high-grade bituminous purchasable below the top circular. The feeling prevails that coal is too high. Business is good in St. Louis only in spots and the demand is not general yet.

Louisville Retail Trade Wakes

The Louisville coal trade reported a stiffer market, due largely to the fact that domestic sizes are moving much better. Retailers, as usual, are buying on a rising market, and the anthracite strike drove domestic consumers to cover. Prices of prime lump and block coal are advancing.

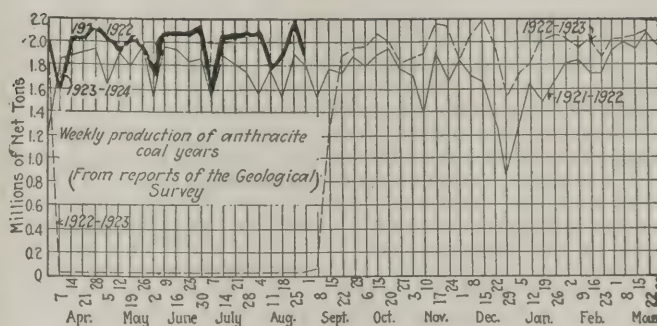

In eastern Kentucky the actual loading market appears at around \$3.50@3.75, with some coal quoted at \$4, while there are plenty of rumors of \$4.25 coal.

Most of the eastern Kentucky demand appears to be from retailers wanting domestic sizes. Industrials are taking screenings nicely. Mine-run is generally slow in movement.

While the western Kentucky coal trade is doing some kicking, the section is producing a lot of coal. From Aug. 25 to Sept. 1 inclusive the field produced 4,100 cars. The market is unsettled, but firmer.

Northwest Business Is Brisk

A record in shipments from the Duluth docks was established last month, when 23,914 cars were sent out. This compares with 18,911 cars in July and 20,313 in August

last year. Heavy shipments of anthracite, railroad and public-utility coal are going out now. On the whole selling is brisk. The Duluth market in both hard and soft coal is strong and shows every indication of higher prices soon. Shipments have fallen off slightly with only forty-five cargoes delivered last week, and of these only three were of hard coal.

The market is brisk in Milwaukee. Stove size anthracite is running a little scarce and the tendency on all coals is toward stiffer prices, though there has been no change in retail quotations on either coal or coke thus far this month. Dealers are not making contract prices, fearing an increase at the mines. Receipts to Aug. 31 were 601,000 tons of hard coal and 1,822,000 tons of bituminous.

Utah operators are finding it difficult to fill orders for lump owing to soft market for slack and intermediate sizes. Working time is around three days a week. A 50c. increase in retail prices is expected. The demand for domestic grades of Southwestern coal continues to stiffen as September advances. There has not, however, been a corresponding increase in demand for steam sizes. Few shut-down mines have reopened.

Ohio Markets Calm Down

There has been a demand for 4-in. and domestic lump coals at Cincinnati. It was hard to move steam run of mine and steam slack, but even with an oversupply there

Coal Age Index of Spot Prices Bituminous Coal F.O.B. Mines

	1923	1922
Sept. 10	205	204
Sept. 1	204	202
Aug. 27	202	427
Sept. 1	202	427
Weighted average price	\$2.49	\$2.47
	\$2.44	\$5.17

This diagram shows the relative, not the actual, prices on fourteen coals, representative of nearly 90 per cent of the bituminous output of the United States weighted first with respect to the proportions each of slack, prepared and run-of-mine normally shipped, and second, with respect to the tonnage of each normally produced. The average thus obtained was compared with the average for the twelve months ended June, 1914, as 100, after the manner adopted in the report on "Prices of Coal and Coke, 1913, 1918," published by the Geological Survey and the War Industries Board.

were practically no concessions in prices. One upward flurry tells the whole story of the anthracite strike so far as that market is concerned. Conditions calmed down but the market has retained what it gained at that time. Smokeless lump and egg hold strong, and some producers and selling agents claim to be sold up for the month. The strike in the hard-coal fields resulted in a better tone in the Columbus market. Buying is more liberal and prospects are considered much brighter. The best feature is the retail demand, many householders coming into the market for their winter supply. Steam coal demand is also showing an improvement, some purchasers getting anxious and disposed to stock up. Railroad demand is fair and utilities purchase heavily. Operators and jobbers serving the Cleveland territory say that the flurry caused by the anthracite situation began to subside as soon as there were indications of a settlement.

The Pittsburgh market has been distinctly quiet as to actual business and inquiry. The reduced demand is matched by reduced offerings. Instead of buying as it were from hand to mouth, buying recently has been in larger quantities, with the result that operators now find themselves in comfortable positions, although they have the same customers as formerly and the rate of shipping has not changed materially.

Business Scarce in New England

In New England there continues a great dearth of spot business. Except for scattering purchases that amount to very little in aggregate tonnage there is almost a complete absence of buying. The large industries are in no different situation than during July and August.

Coals from central Pennsylvania share the general dullness. Buyers are frankly not interested and there is no real encouragement for September and October. More than a few contracts undertaken in May for delivery through the summer have suffered cancellation at the hands of the purchaser for no other reason than the fact that fuel consumption has fallen far below what was relied upon as a normal season.

At Hampton Roads there is only a light movement coastwise. Spot sales are few and far between.

Seaboard Markets Unruffled

In the territory served by the New York market the idleness of the anthracite mines failed to create any excitement. Demand and inquiry remained dull. Inquiry for the bituminous screened coals fell off, but coke was in good call and prices generally showed advances. Conditions, so far as demand for soft coal is concerned, were similar in the Philadelphia market. Numerous producers expected better business, and while it is not visible there is a belief that there was a slight improvement. Consumers have come into the market and it is believed the autumn outlook is more than fair. Baltimore buyers are not inclined to buy heavily, now that the hard-coal strike has been settled, as it is not evident to them that soft-coal prices will change to any great extent. In West Virginia there has not been as much activity as might have been expected as a result of the anthracite mine suspension.

Anthracite Prices Fluctuate

The settlement of the strike in the anthracite mines materially changed the market so far as quotations for independent hard coals were concerned. Prices fluctuated considerably during last week, every day bringing new quotations based upon developments in the negotiations at Harrisburg. While quotations as high as \$14.75 for the domestic coals were reported on Thursday, these had dropped more than \$2 on Monday of this week and the indications pointed to further concessions. About the only coal offered in the New York market was in boats, and prices were quoted alongside. Washery egg, stove and chestnut sizes were offered around \$12.50 at loading points but there was little buying, dealers believing that the miners would soon return to work. There was some offering and buying of briquets at \$6.35@\$. There was considerable inquiry for Welsh anthracite, mostly from New England, although dealers from New York also asked prices. It is reported that two cargoes are due to arrive in New York in about ten days.

DUE TO THE SUSPENSION OF MINING in hard-coal fields and the practical stoppage of shipments from the mines, quotations are merely nominal, and are not printed. Coal Age quotations on anthracite will be resumed when the new prices are available.

Foreign Market And Export News

Storms Delay Loading of Welsh Coals; Output Gains Slightly

Increased stocks of the lower grades of coal, due to delays in loading because of recent storms, are reported from the South Wales market.

Output of coal in Great Britain's mines during the week ended Aug. 25 was 5,163,000 tons, says a cable to *Coal Age*. This compares with 5,124,000 tons in the previous week, and 5,148,000 tons in the corresponding week of last year.

Though more active than last week the coal market in Wales is comparatively quiet. As a general rule supplies are in excess of demand, except in the case of one or two special brands. European buyers are cautious due to the state of the exchanges. France, Belgium and Italy are holding back, and the German business is slow.

On the other hand European stocks are undoubtedly low, and this, combined with the gradual decline in the price of Welsh coal, leads to the belief that the Continental demand must revive before long.

The situation in the U. S. anthracite field was watched closely, and Welsh anthracite operators were preparing for a possible increase in demand.

The Newcastle market seems to be gradually going from bad to worse. It is hoped that September will see an improvement. Inquiries are at their lowest ebb and contractors are taking only minimum requirements.

There are several inquiries circulating in Newcastle which may lead to a temporary improvement.

Hampton Roads Market Dull

The situation at Hampton Roads was dull last week, with an appreciably dropping off in exports and with a number of vessels reported en route for cargoes failing to appear. The piers dumped on an indifferent schedule, purchasers appearing reluctant to come in the market under present conditions.

Shippers were anxiously awaiting the outcome of the hard coal miners' strike, with the general belief that some settle-

ment would be reached before the situation became serious. Contracts were not considered pending the outcome of this controversy.

Coastwise business showed some increase, as did the bunker trade, the export business alone falling off. Some leading shippers expressed the opinion this foreign trade would not be likely to increase this winter. The tone of the market was dull.

French Mines Meet Demand

Output of French industrial coals are sufficient to meet the demand, although shipments from the mines are delayed. This condition is believed to be but temporary, as hopes are entertained for better deliveries from the Ruhr. Consumers are not inclined to

buy any more British coal than absolutely necessary, because of the high prices.

House coals supplies are low and if no improvement occurs before fall there will be insufficient stocks on hand to meet the winter demand. Inquiry is expected to increase during the month.

News Items From Field and Trade

ALABAMA

The Townley Coal Co. has been incorporated in Townley, with a capital of \$50,000, by M. K. Lang, R. Voight and others.

The Morrison Coal Co. has been incorporated in Birmingham by A. K. Foster, Vernon M. Brown and others.

ARKANSAS

Hiram Fuller, who resides on the Warren and Pine Bluff road about six miles from Pine Bluff, while digging water well on his farm struck a vein of peat at a depth of 90 ft.

COLORADO

The Boulder Valley Coal Co. plans to make extensive improvements on its property in Lafayette.

ILLINOIS

The W. G. Hughes Coal Co., Chicago, has just been incorporated with a capital stock of \$30,000, to deal in coal mines. The incorporators are C. I. Abbate, W. G. Hughes and K. R. Leva.

Appointment of W. H. Smithburne as general sales manager of the Great Lakes Coal & Coke Co. has been announced. Mr. Smithburne has been connected with the Bickett Coal & Coke Co. for sixteen years, during the last seven of which he was secretary of the firm. Previous to this he was associated with the Burlington R.R.

The validity of Chicago's bulk load weight ordinance, which has been the subject of much dispute, is soon to be settled. Following the unsuccessful attempt, recently, to secure an annulment of the law by means of an injunction, the matter is to be fought out in the courts on an appeal of a conviction. Although 123 firms and individuals have joined the fight, there are but two exclusive coal dealers included, most of the petitioners being dealers in building materials.

Shafts are swiftly sinking, a railroad is under construction and a town is laid out at Nason, in Jefferson County, where the Illinois Coal Corporation is building its new mine, planned to be a 10,000-tonner. The two shafts were down about 150 ft. on July 4 and three miles of the Jefferson & Southwestern R.R., owned by the corporation, were built. A recent sale of town lots disposed of considerable property.

INDIANA

In order to relieve the coal cars for commercial service during the coming months, the Fort Wayne division of Pennsylvania R.R. is storing its winter supply of coal at various points along the line. A total of 85,000 tons is allotted the division. Of this amount 45,000 tons will go to Fort Wayne, Ind. The fuel is being stored in the east yards and is being unloaded at the rate of 700 tons a day.

KENTUCKY

The See-See Coal Co. has been incorporated in Pineville, with a capital of \$75,000, by R. I. Cawthorne, E. R. Martin and others.

B. D. Williams and Adolph Woodruff, of Mannington, Ky., and W. W. Minter, of Memphis, Tenn., have organized the Jellicoe Coal Co. with \$500,000 capital for mining coal in the Whitesville section.

NEW YORK

Pattison & Bowns, Inc., of New York City, announce that as of Sept. 1 they succeeded the firm of Williams & Peters as sales agents for the Pennsylvania Coal Co. and affiliated companies, and have the exclusive sale of Pittston coal in the Eastern territory. They will conduct this business as their Pittston division. The unfilled orders of Williams & Peters will be entered on their books and unless countermanded by the parties who have placed the orders with them, will endeavor to make shipments subject to the usual terms and conditions. Pattison & Bowns have taken over the

offices and staff of Williams & Peters and, as far as possible, will conform to their sales policies. The business of the Pittston division will continue to be conducted from Room 1014, Whitehall Building, formerly the offices of Williams & Peters.

According to the New York State Committee on Public Utility Information, which has made a survey of the stocks on hand, the gas companies of New York State have in reserve more than 300,000 tons of anthracite, which is equivalent, on the average, to a five months' supply for those companies making gas from anthracite exclusively. In addition to this, plants using soft or "gas" coal have on hand, according to the latest information, a three months' supply on the average.

Harold C. Knapp, formerly of the Irving Bank-Columbia Trust Company, has assumed the position of trust officer of the Coal and Iron National Bank of the City of New York, succeeding Arthur A. G. Luders, resigned. Mr. Knapp was graduated from the New York University Law School in 1908 and, being admitted to the bar, practiced law until 1918. He then joined the Irving Trust Co. Mr. Knapp is a member of the faculty of the New York University School of Commerce and Finance and the co-author of a volume entitled "Wills, Estates and Trusts."

OHIO

The Tuscora Coal Co., Coshocton, has been chartered with a capital of \$25,000 to operate mines in the Tuscarawas field. Incorporators are D. E. Morris, W. H. Morris, Mathew Banks, Charles W. Banks, Albert F. Baier and J. G. Gamble.

Additional contracts for coal for various state institutions have been awarded by the Ohio Board of purchase as follows; Ohio Building, Columbus, 1,500 tons of Hocking nut, pea and slack, Burns Coal Co., at \$3.49 delivered; State School for the Blind, Columbus, 2,000 tons of Hocking nut, pea and slack, Burns Coal Co., Columbus, at \$3.49 delivered; State House, Columbus, 1,500 tons of Hocking mine-run, Burns Coal Co., Columbus, at \$4.24 delivered; Wyandotte Building, Columbus, 500 tons of Hocking mine-run, Burns Coal Co., Columbus, at \$4.24.

The Dominion Coal Co., of Columbus, chartered several weeks ago with an authorized capital of \$25,000, has been organized by the election of K. W. Rittenhouse as president and D. F. Shaffer as secretary and treasurer. The company will be exclusive sales agent for the Standard Coal Co., at Nelsonville, and will also engage in the general jobbing business. D. F. Shaffer is the owner of the Standard Coal Co. mines. K. W. Rittenhouse was formerly sales manager of the Consolidated Mining Co. of Columbus.

A series of accidents on Aug. 30 in Belmont County, across the river from Wheeling, resulted in one man being killed and four other injured in the mines.

OKLAHOMA

The Bull Creek Coal Co., of which A. D. Rushmart, Locust Grove, is manager, has 120 acres of coal land near Inola, under development and is installing a steam shovel and other equipment.

PENNSYLVANIA

Anticipating an increased demand for crushed coal as a domestic and heating fuel, two new crushers have recently been installed in the Connellsville field. The Reliance Coal & Furnace Co., at its Denbo plant in the lower Connellsville field, has its crusher well on the way to completion, while the Mahoning Coal & Coke Co. is making rapid progress with its crusher at the Peerless works in the Connellsville district. Other crushing plants which have not been in operation for some time are being overhauled.

The Clearfield Bituminous Coal Co. has awarded a contract for the erection of a new modern tippie at its Clymer mine to the Pittsburgh Coal Washing Co. It will be equipped with screens, picking tables, rock-handling conveyors, and will be able to load coal with the rock conveyor.

While the mine suspension is on officials of the Wolfe Coal Co. is working on plans to open up a stripping operation in close proximity to their mines at Lattimer. A valuable bed of coal will be unearthed as soon as the suspension is over. A large tract of timber land has to be cleared at the stripping site. The timber cut will be utilized in and about the mines when operations resume.

Cosgrove & Co., coal operators and shippers at Johnstown, have purchased the R. L. Sproat mine operations and coal holdings near Windber. With the purchase of the Sproat interests, a new firm was formed, which will be known as the Windber Standard Coal Co., with H. J. Meehan, an officer of Cosgrove & Co. and of the Cosgrove & Meehan Coal Corporation as president, and John C. Cosgrove, president of the Cosgrove & Co., as secretary-treasurer of the new firm. A charter for the firm has been applied for. The new owners have taken charge of the newly acquired operations and are making arrangements to increase the output. Modern equipment has been ordered and work on a new mine opening will be started at once, it is announced.

Graham Bright, formerly general engineer in charge of the coal and metal mining department of the Westinghouse Electric & Manufacturing Co., who has joined the firm of Howard N. Eavenson & Associates, mining engineers, of Pittsburgh, was the guest of honor Aug. 14 at a farewell dinner given at the Edgewood Country Club,

GRAHAM BRIGHT

Pittsburgh, by his friends of the industrial company with which he was connected for twenty-one years. Mr. Bright will give special attention to power-house systems, power-plant appraisals, transportation and transmission systems for coal and metal mines and general industrial power application.

The first skirmish to their battle for a lower and more uniform coal valuation was won recently by owners of Greene County coal lands who appealed the 1922 triennial coal assessment. Judge G. G. Sloan, president judge of the Clairton County courts, sustaining the objections of the Shannopin Coal Co. and other appellants, ordering the coal valuation returned to the 1921 figures and the refunding of the excess taxes collected by the county and townships from the appellant coal owners. Under the ruling of the court, however, taxes will be refunded only to those who joined in the appeal of the assessment. Altogether there were about 200 appellants, but the only hearing held was on the appeal of the Shannopin Coal Co., a holding corporation of the Jones & Laughlin Steel Co., which owns a block of about 14,000 acres of Pittsburgh coal in Greene, Perry and Dunkard townships. The coal owners complained that the county commissioners had not assessed the coal uniformly and that it was assessed at a higher figure in proportion to its value than the surface. The county commissioners in March, 1922, sitting as a board of revision, raised the coal valuation in every township and borough of the county, the increase ranging from 10 per cent to 60 per cent.

The Olyphant Coal & Coke Co., formerly controlled by the late Senator William E. Crow, on Sept. 5 was placed in the hands of receivers by Judge E. H. Reppert. W. W. Parshall, J. W. Abraham and W. L. Byers, of this place, were named temporary receivers. The liabilities were declared to be \$423,000 and creditors filed petitions de-

clarifying that a fair value of the property exceeds the liabilities and that overproduction of coal and the present state of the market made a receivership advisable in order to preserve the equity of the company. The company owns 500 acres of land north of Uniontown.

Possibility of a legal test of the law passed at the last session of the Legislature, compelling anthracite companies to furnish coal to schools, churches, hospitals and other public institutions where public health is endangered, may result from inability to obtain a supply of coal from local companies or dealers for St. Mary's German Catholic Church. The bill which compels the companies to furnish anthracite under penalty of a \$1,000 fine or a year in prison, was sponsored by Representative Thomas O'Boyle, and was the outgrowth of the situation in Olyphant last winter, when a shortage of coal resulted in the seizure by a body of citizens of several carloads which were distributed among the church and schools in that borough.

Twenty-one teachers of engineering from twenty-one widely scattered colleges and universities spent the month of July in the East Pittsburgh works of the Westinghouse Electric & Manufacturing Co. renewing their contact with industry in the interest of better teaching. This is the thirteenth consecutive season that a group of engineering teachers has gathered at the Westinghouse company, and during these years more than four hundred engineering teachers representing every engineering college in the United States and many of the leading institutions in foreign lands have participated in the conferences. Each man was assigned to the department or section of the works in which he would be in contact with the men who could best give him what he wanted. Several of the men went into various kinds of testing, others into engineering departments, and a few into the manufacturing sections. A similar program at which emphasis was entirely on steam equipment was conducted at the South Philadelphia plant of the Westinghouse company.

The executive committee of the Coal Consumers' Association of Philadelphia on Aug. 30 protested against a wage increase to anthracite miners in a telegram to Governor Pinchot as follows: "We regret to learn that the concessions proposed for settling the anthracite coal controversy include a 10 per cent increase to mine workers and what is equivalent to an acceptance of the check-off. This is not time for advancing costs. The public demands liquidation of all items making up the retail price, including royalties, wages, operators' margin, freight, brokerage and retailers' margin. We are convinced that these features of the proposed plan of settlement are without justification even from the viewpoint of political expediency and we protest against their acceptance."

TENNESSEE

The Crystal Ice & Coal Co., of Erwin, proposes building an addition to its coal tippie.

TEXAS

The Palestine Coal Co. has been incorporated in Palestine, with a capital stock of \$150,000, by R. McDonald, T. C. Richey and others.

UTAH

The Blazon Coal Co., through L. F. Rains, president, and A. H. Dennison, secretary, has filed an amendment to its articles of incorporation increasing the capital stock from \$200,000 to \$300,000.

VIRGINIA

William H. Moore, formerly with the Chesapeake & Ohio Coal & Coke Co., is now with the Fort Dearborn Coal Co. in the capacity of inland sales agent with offices at Norfolk. He is at present at the company's mines in West Virginia, studying conditions.

The Clinch River Coal Corporation, of Virginia, has purchased the properties of the Odle Coal Corporation. They are located at Coeburn, on the Pocahontas Division of the Norfolk & Western Ry. and consist of 634 acres. The new owners plan to increase the production of the mines, particularly the domestic sizes. William J. Jegen, of Edge Hill, Pa., is president of the Clinch River company.

WEST VIRGINIA

Coal loadings on the Chesapeake & Ohio Ry. surpassed all previous loadings for any

one day on Monday, Aug. 27, when a total of 4,354 cars was reached, equivalent to 217,700 tons based on an average of 50 tons to a car. The best record previously established was on May 8 of the present year, when a total of 4,136 cars were loaded. All monthly records were broken during August, when the company transported 73,700, or a total of 3,685,000 tons, an increase of 301,750 tons over July, when a new monthly record was established.

Notwithstanding the general dullness which has prevailed throughout northern West Virginia during the summer months, all the Pittsburgh vein operations in the Monongalia field and all but two of the Sewickley mines in the same field have been running virtually on a full-time basis. The output on Scott's Run is averaging something like 250 cars of coal a day. On the Morgantown & Kingwood mines are being operated on a part-time basis only.

Methods of organization and control of work in the coal mines with particular reference to discipline and supervision as compared with factory discipline are being investigated in West Virginia mines by Carter Goodrich, of Amherst College. Mr. Goodrich began his investigation in the Winding Gulf District of West Virginia late in August, being the guest of E. E. White, president of the E. E. White Coal Company and also president of the Winding Gulf Operators Association.

The Tildesley Collieries Co., of Charleston, has been launched by Charleston capitalists with a view to operating in the Kanawha field. The company has an authorized capital stock of \$100,000. The incorporators are E. W. Tildesley; V. G. Tildesley, S. S. Tone, P. M. Stone and A. M. Grabill, all of Charleston, W. Va.

The trial of Howard R. Harrah, foreman of the jury which was unable to reach a verdict in the trial of William Blizzard, and who was indicted by a Greenbrier County Grand Jury about a month ago, charged with having accepted \$700 to bring about a disagreement on the jury, has been set for Sept. 17 at Lewisburg. G. Clarence Hickey also will go on trial on that date. Hickey is alleged to be an agent of the United Mine Workers and is alleged to have made the payment of \$700 or about that sum to Harrah.

The number of coal companies organized in West Virginia in July was the smallest for the year, only seven, having an aggregate capitalization of \$215,000 being formed. In the list of new companies formed were the following: J. W. Powell Coal Co. of Charleston, \$15,000; Glen Valley Coal Co. of Wheeling, \$50,000; Big Coal Land Co. of Charleston, \$25,000; Sugar Creek Coal Sales Co., \$50,000; Dell Coal Co. of Charleston, \$50,000; Virginia Coal & Coke Agency, Inc., of Huntington, \$20,000; Pond Coal Co. of Charleston, \$5,000. Seven West Virginia coal concerns, as follows, surrendered their charters during July: Princess Coal Co., Richland-Brooke Coal Co., Gorman Coal & Coke Co., Springdale Coal Co., Flynn Coal & Coke Co. and Kildow Coal Co.

Contracts have been awarded by the Consolidated Coal Co. for a large number of new houses of modern design for the occupancy of miners at the Coalwood plant of the company, in McDowell County. Since the Consolidation took over the plant at Coalwood, which is the center of operations of the company's New River-Pocahontas division churches, school houses and club houses as well as many other dwellings have been constructed and innumerable improvements made in accordance with the Consolidation's policy of installing equipment necessary to insure efficiency. The Consolidation bought the mines in the Pocahontas district from the Carter interests some time ago and has been engaged in building up the property ever since.

Thomas Harding, in charge of the pumps at the Glen Rogers shaft mine of the Raleigh-Wyoming Coal Co. at Glen Rogers, of which Carl Scholz is vice president and general manager, is receiving high praise from mining men for an act of loyalty and fidelity recently performed. Late in August he was called from bed about 3 a.m. to learn that both the pumps at the bottom of the shaft of the mine were out of commission and that the sump was filling with water. When Harding arrived at the bottom of the shaft the pump operated by air was entirely submerged and the water was rapidly closing around a large electric pump. Although there was 18 ft. of water in the bottom of the shaft, Harding dived to the bottom four times in order to loosen the air pump and raise it to a higher level where it could be operated. His act saved the mine from flooding.

An attempt to destroy the tippie of the Preston County Coke Co. at Cascade, in

Preston, was made on Sunday morning, Sept. 1, when fifty sticks of dynamite was used which had been stolen from the company's powder house. Only crushing machinery was affected. A wash house near the dwelling of a boarding-house keeper also was dynamited a few minutes after the dynamite under the tippie was set off, one corner of the wash house being blown off. A 20 per cent reduction in wages was made on Sept. 1 but an official of the company had nothing to say as to whether he thought the wage reduction had anything to do with the dynamiting. Although the company has at no time had any labor trouble it has been operating on an open-shop basis since the Bethlehem Mine Corporation's strike following the adoption by that company of the open-shop plan.

The National Tax Association has invited everyone interested in taxation to attend, whether members of the organization or delegates or not, its sixteenth annual conference to be held at the Greenbrier, White Sulphur Springs, Sept. 24 to 28. Special emphasis has been placed on the invitation to men in the mining industry. The conference will discuss state income-tax amendments, including the proposals of publicity of income tax returns as provided in Wisconsin; classified against general income taxes, including double taxation. These and other kindred topics of interest to the mining industry are to come up for thorough analysis and it has been recommended that mine owners and operators who will be unable to attend the American Mining Congress conference on mine taxation to be held in Milwaukee, Sept. 24-29, obtain from the governors of their states appointments as delegates to the National Tax Association conference.

A suit for \$300,000 instituted in the Circuit Court of Raleigh County by the Summit Coal Co. against the Raleigh Smokeless Fuel Co., for alleged damages, was won by the defendant company. In its suit the plaintiff alleged that it had authorized the sales company to contract, for its account, on Jan. 2, 1920, for the sale of 2,000 tons of coal per month, for delivery between April 1, 1920, and April 1, 1921, at a stated price but that the sales company had made false representations to the effect that it had entered into such a contract and the plaintiff company accepting such representations in good faith had shipped the necessary tonnage to and through the agency. Evidence produced went to show that the coal company had given the agency the necessary authority and that the sales company had in fact sold the coal in accordance with instructions given it and at the price fixed in the instructions. It also was developed that the sales company had appraised the coal company as to whom the coal had been sold and that the sales company had furnished the coal as agreed upon. Under the circumstances the court directed a verdict for the defendant.

When the special convention of the United Mine Workers of District 17 was opened at Charleston Sept. 5, delegates were present from practically every organized coal field in West Virginia. The convention was called as the result of an agitation waged in northern West Virginia since early in the year for an opportunity to air disputes and grievances growing out of the last election of the United Mine Workers, irregularities being claimed. Insurgent members of the union also are demanding a better accounting of the funds paid into the district treasury. The fact that the sessions of the convention were executive and the fight made over a report favorable to the administration submitted by the committee on rules and order of business, disclosed just how serious is the internal strife between the district officers and the northern section of the district. It was sought by the committee on rules to prohibit the introduction of a motion except by unanimous consent. After protracted debate the report was recommitted to the committee and amended so as to provide that any motion not submitted to the proper committee before noon of Sept. 5 could only be introduced upon a majority vote of the convention.

WASHINGTON

To celebrate the opening of the Jordan Valley Coal mine at Everett, the public was invited to attend a basket picnic at the mine, located between Arlington and Granite Falls, on Sunday, Sept. 2. New machinery is being installed. The picnic featured the formal opening of the mine on a commercial basis.

Announcement has been made by the Quartermaster's Department of the U. S. Army at Seattle that pursuant to instructions received from the quartermaster supply officer, San Francisco General Intermediate Depot, Fort Mason, San Francisco,

Cal., no award will be made for the quantities of coal advertised for for Forts Casey, Ward and Worden, Wash., bids for which were opened July 25.

Bids will be opened on Sept. 20 at the Quartermaster's office in Seattle for furnishing and delivering 531 net tons of bituminous lump coal, over 2-in. screen for Fort Casey; 380 net tons bituminous lump coal over 2-in. screen for Fort Ward, and 1295 net tons bituminous lump coal, over 2-in. screen for Fort Worden.

WISCONSIN

Emmet J. Carrigan was appointed receiver for the Valley Coal Co., Milwaukee, by the Federal court in that city on Aug. 24. A petition by the Bickett Coal & Coke Co., of Chicago, alleges that the company admitted liabilities in excess of \$100,000, that it had made no sales in a month or more and that it had been keeping afloat on amounts received from past sales. The petition further alleges that the book value of the company is about \$67,000, while the actual value is only \$24,000.

WASHINGTON, D. C.

By direction of Secretary Work, of the Interior Department, the Bureau of Mines is planning to begin an investigation of the peat deposits of the United States. At the request of Senator Fletcher, this will include an inquiry to determine whether peat exists, and to what extent, under the soil of Florida. The bureau has on hand approximately \$50,000 from an appropriation for investigation of lignite and peat. Attention thus far has been devoted to lignite, principally in the Dakotas, the matter of peat having been delayed owing to inquiries into that subject by several European countries, to determine the value of their deposits for fuel and for extraction of byproducts, so that this experience might be available to this country as a foundation for its work. Details of the peat investigation will be worked out in the next few months and work will begin in the South, probably this winter.

CANADA

According to official announcement by the Ontario Government machinery for equitable and price-controlled distribution of fuel throughout Ontario will be continued during the coming winter season by the Provincial Government.

Frank Hodges, secretary of the Miners' Federation of Great Britain, who is in Canada, said at Montreal recently that with something like 1,500,000 persons practically permanently unemployed in Great Britain, immigration was of primary importance to the British. He added: "I have come with a view to help as much as I possibly can rather than to criticize and I propose to study existing plans." Mr. Hodges is a fraternal delegate to the Trades and Labor Congress of Canada, which meets in Vancouver this month.

Application has been made to the Montreal Stock Exchange for the listing on the unlisted department of the authorized issue of \$3,000,000 or 5 per cent first mortgage bonds due 1940 of the Cumberland Railway & Coal Co. In addition to the bonds the company has an authorized capital of 20,000 shares of common stock of \$100 par value, all of which is outstanding. Bonds may be called at \$105 on any interest date. Officers and directors of the company are: President, R. M. Wolvin; vice-president, Hector McInnes, Halifax; secretary, C. S. Cameron, Montreal; assistant secretaries, W. A. Doig, J. A. Kempton, Montreal; D. H. McDougall, Sydney.

Output for the month of August from the mines of the Dominion Coal Co. was one of the largest since March, 1916, when the grand total output of 379,254 tons was produced, while the output for the past month was 366,246 tons. During the month three of the collieries made new records, namely, Dominion Nos. 6, 11 and 24, while Dominion No. 10 Colliery (Reserve) produced only six tons less than its former record, made in June, 1912. Dominion No. 2, with an output of 72,248 tons, was the best since March, 1916, when the output totaled 74,095 tons. Dominion No. 16 (New Waterford) produced the high figure of 22,171 tons.

Anglo-Canadian Collieries & Refineries, Ltd., of Edmonton, Alta., with an authorized capital of \$1,500,000, has been incorporated by Prosper E. Lessard, Guy W. Marriott, Bryce J. Saunders, Sir George B. Farmer and others, of Edmonton.

It is stated that Cape Breton, N. S., companies are prepared to supply large quantities of coal to New England centres if a strike of anthracite coal miners causes a

fuel shortage there. For various reasons the Canadian market is at present not brisk enough to take all the coal that can be dug in Nova Scotia, and, consequently, there is a large surplus that can be diverted to the States.

In an address before the Canadian Gas Association in Ottawa, J. L. Landt, of the Dominion Fuel Board, advocated the use of coke in the home, stating that it was a cheaper fuel than anthracite and yielded good results in prepared sizes.

Alberta operators in session at Calgary took no official action on the proposition to sell Alberta coal in Ontario, taking the view that with the heavy crops to move there would be no cars available for any large quantities of coal.

Miners at the Newcastle and Western Gem mines, Drumheller, Alta., went on strike Aug. 30 on account of the employment of non-union men. A mob went to the Western Gem mine to prevent non-unionists from working and a riot broke out, in the course of which two police constables were seriously injured. All Drumheller mines were idle on Aug. 31. Robert Livett, international representative of the U. M. W., stated that the men had acted without consulting the union officials.

George E. Stringer, of Yorkshire, England, head of the British syndicate that has obtained a controlling interest in the Princeton Coal & Land Co., has arrived at Princeton and will start an active campaign for increased production. As soon as suitable men are available, the force at the mine is to be increased from its present strength of 125 to 500, with a view to increasing output to 500 tons per day. The mine has been in operation for several years under the superintendence of Francis Glover, who will retain the management of the property. The output of the mine for last year was 19,418 tons, against 13,966 in 1921. The new owners purpose erecting coal bunkers at Vancouver, for the purpose of bunkering ships.

Obituary

Morris L. Painter, for many years actively engaged as a coal operator at Greensburg, died Sept. 1 at his home. He had been ill for many months. Mr. Painter for a long time was vice-president of the Westmoreland National Bank of Greensburg.

Association Activities

Directors of the West Virginia Coal Association held a meeting at Charleston when it became inevitable that anthracite miners were going to suspend work. It was decided that inasmuch as West Virginia has the grade of coal best suited as a substitute for anthracite, the association take every possible step in expediting the mining of coal in order to save the country from distress which otherwise might ensue. A statement issued by the association closed with this paragraph: "We have the coal, we have the mines, we have the workers and we have the equipment to take care of almost any demand made upon us if only we are assured that sufficient railroad equipment will be provided to move the tonnage that we are able to produce."

Traffic News

An investigation into railroad freight rates on anthracite has been ordered by the Interstate Commerce Commission in response to a suggestion by the U. S. Coal Commission. Public hearings will be conducted by the Commission through Examiner Disque, at Pittsburgh, Pa., Sept. 24, at 10 a.m. in the Chamber of Commerce Building. The proceedings will embrace an inquiry into all phases of anthracite coal handling by the railroads including rates, changes, regulations and practices of the carriers.

Class 1 railroads of the United States, according to reports to the Interstate Commerce Commission from 193 roads representing a total mileage of 235,670, in July earned an annual rate of return of 4.93 per cent on their tentative valuation as fixed by the commission for rate-making purposes, including additions and betterments up to Jan. 1, 1923. This rate represented a net operating income for the month of \$84,591,400. In the eastern district the rate earned was 5.60 per cent; the southern dis-

trict, 5.26 per cent, and the western district 4.05 per cent. In July last year the same carriers earned a net operating income of \$69,321,000, which was at the annual rate of return of 4.12 per cent. In June this year the rate was 5.47 per cent.

The complainants in Docket No. 12,712—Hood Coal Co. et al. vs. Monongahela Valley Traction Co. (now Monongahela West Penn Public Service Co.) et al.—filed with the Interstate Commerce Commission Aug. 29 a petition for rehearing and leave to amend complaint, which alleged unreasonable combination rates on coal from mines in independent short lines within certain producing districts and rate groups to interstate destinations on trunk lines.

As a means of more efficiently handling the freight traffic through the Raleigh yards, the Chesapeake & Ohio is extending a new double track 2,000 ft. near the roundhouse and near Raleigh. The company also is installing four additional tracks near the Raleigh Coal & Coke Co. plant. In order to make way for the tracks the coal company is moving several houses for the new tracks, which will accommodate several hundred cars. In addition to the new trackage, the company is pacing a new coaling station near the roundhouse so that engines may be coaled without delay and within a short distance of the shops.

At a recent hearing of the carriers before the Alabama Public Service Commission on the proposed general coal and coke rates on interstate shipments, the argument was advanced by N. W. Proctor, of Louisville, representing all the interested railroads, that the burden of proof in proceedings before the Commission is not on the carriers where the justness of an existing rate is questioned by other interests, or a citation holding that the existence of a rate approved by the commission constitutes prima facie evidence that the rate is fair and reasonable. The adoption of this contention would serve to preclude, it is stated, any general schedule of reduced rates, but would confine adjustments to specific individual complaints from points where representatives held current rates to be unjust.

During the month of August 2,579,225 net tons of bituminous coal and 232,723 net tons of hard coal passed through the canals at Sault Ste. Marie. Of this tonnage 2,557,659 tons of bituminous coal passed through the United States canal, and 21,566 tons through the Canadian canal. Of the anthracite tonnage 222,741 tons passed through the United States canal and 9,982 tons through the Canadian waterway.

From Jan. 1 this year to Aug. 15 railroads of the United States placed in service 41,982 new coal cars, 41,712 new box cars and 13,149 new refrigerator cars. Of this number, 6,424 cars were placed in service during the first 15 days in August. On Aug. 15 the roads had on order 80,535 new freight cars, of which 31,946 were coal cars. The roads placed in service from Jan. 1 this year to Aug. 15, 2,364 new locomotives, of which 143 were delivered during the first 15 days in August. In addition they had on Aug. 15, 1,674 new locomotives on order.

The railroads on Aug. 15 had, out of 2,280,440 freight cars on line, 188,635, or 8.2 per cent, in need of repair. This was a decrease of 379 cars from the number in need of repair on Aug. 1, at which time there were 189,014, or 8.3 per cent.

Coming Meetings

The American Mining Congress will hold its twenty-sixth annual convention in conjunction with the National Exposition of Mines and Mining Equipment, Sept. 24-29, at the Milwaukee Auditorium, Milwaukee. Secretary, J. F. Callbreath, Washington.

National Safety Council will hold its twelfth annual safety convention at the Buffalo Statler Hotel, Buffalo, N. Y., Oct. 1-5. Secretary, W. H. Cameron, 168 N. Michigan Ave., Chicago, Ill.

Fifth annual general Western meeting, Canadian Institute of Mining and Metallurgy, Oct. 3-5, at Estevan, Saskatchewan, Canada. Secretary, G. C. Mackenzie, Drummond Building, Montreal, Que., Canada.

The West Virginia-Kentucky Association of Mine, Mechanical and Electrical Engineers will hold its annual meeting Oct. 19-20 at Huntington, W. Va. Secretary-treasurer, Herbert Smith, Robson-Prichard Bldg., Huntington, W. Va.

Coal Mining Institute of America will hold its annual meeting Dec. 19, 20 and 21 at Pittsburgh, Pa. Secretary, H. D. Mason, Jr., Chamber of Commerce Building, Pittsburgh, Pa.

The Only National Paper Devoted to Coal Mining and Coal Marketing

C. E. LESHER, Editor

Volume 24

NEW YORK, SEPTEMBER 20, 1923

Number 12

It's a Thin Alibi

AND so the Herrin horror was a bit of communism! The able publicists of the United Mine Workers tell the world it is so—and back up the statement with certain proofs, such as they are. In view of the zeal with which the United Mine Workers organization hindered the progress of a so-called justice in Williamson County following the Herrin massacre of June, 1922, and in view of the spirit with which it leaped to the defence of the long list of Williamson County citizens finally indicted for murder, the union must have been quite sympathetic with communism at the time. Why the change now?

There are two reasons. The principal one is that communism offers a ready and popular alibi for everything. The publicists' picture of John L. Lewis patriotically battling the red influence that strives insidiously to undermine the honest labor of America is an heroic one. It is certain to exalt that labor leader in the minds of many Americans. And the United Mine Workers, as an organization, will enjoy a certain vicarious heroism by the same sign. The publicity which the miners' union is putting out and will continue to put out on the subject will be good publicity. Many an American, thinking along the surface of things, will accept it as true because he will not know any better.

The second reason for the alibi is an internal one. There are thousands of honest, sound, reputable citizens in the ranks of the United Mine Workers. They believe in good citizenship. They can see no reason why unionism should run counter to it. They have been unable to reconcile the attitude of their union at Herrin with the commonest rules of such citizenship. It is necessary to calm their fears for their organization. So union headquarters offers them the alibi. This alibi was late in coming, because it could hardly have been set up when the facts in the Herrin case were fresh in the country's mind, but it is better late than never, and better than nothing. It may be convincing to a lot of good union men anxious to be convinced. They must be pretty anxious, however.

Every man in the union knows the venom of the organization toward non-unionism. Every man knows that a foolish operator at Herrin deliberately defied the union at a time when it was on a strike and in fighting mood. Every man knows that in the heat of the Herrin situation President Lewis sent an inflammatory telegram bidding the union men of the region to treat the non-unionists in the strip mine as "common strike breakers," which was about as open an order for violence as a man in Mr. Lewis' position could issue. Every man knows that unionism carried out the order bloodily and then did everything within union power to prevent the punishment of everybody connected with the crime of butchering twenty-five men before the eyes of hundreds of citizens.

By buying the strip mine and then disposing of it as quickly and as surreptitiously as possible in order to satisfy damage claims against the organization the union's admission of responsibility was established if any proof were needed. So what basis is there for all this stuff about communism? It is a poor alibi, but, after all, better than nothing. And when John L. Lewis is put forward, in due time, as the logical successor to Samuel Gompers, it must not be said that he is a red. It is laudable for him to stifle communism if he can, but why blame communism for Herrin?

Perilous Winter

ALREADY we are approaching the perilous months when the mines dry out and explosions of dust are to be apprehended. It is said of the foreigner who enters our mines that he is careful for a year or so and then forgets and becomes "frequent deceased." It seems to have been just so with the coal industry. It heard, largely through the Bureau of Mines, the dangers of coal dust and it listened, learned the lesson, put it partly in practice and then—forgot or almost forgot what it had learned.

Let this be a reminder, for much remains to be done. Runaways must be avoided and wires must be protected or there may be another Dolomite; water-sprinkling pipes must be guarded against frost or there may be another disaster like that at Stag Canyon. Dust must be thoroughly wetted so that it will ball in the hand. Unfortunately water will roll in dust without wetting it, consequently the application should be drenching so as to move the dust where moisture can continue to affect it.

Air conditioning is an excellent way of preventing the drying of a mine or of wetting it when dried. Little technique has developed in regard to this subject but enough is known that the work can be done effectively if not with maximum efficiency and economy. Unfortunately the air usually is supplied by a pressure fan, and the wettest part of the mine is apt to be the return airway which is least likely to be in danger.

Furthermore, if damage is done to the return airway by excessive heat and moisture it is the very part that is least readily repaired. Where also the gas is by a plenum system of ventilation put under compression it is likely to come rolling out into the roadways as soon as the fan stops. However, so much can be said in favor of conditioning the air that it should be done wherever the roof will permit, even if it be necessary to protect the roof with concrete for some distance from the fan.

Now also is the time to take careful stock of rescue and self-rescue equipment. Hardly a large explosion occurs where men could not save themselves if they had some means of traveling for a short time through the poisonous mine atmosphere.

The Coal Commission on Strikes

THE Coal Commission has issued, so far, two reports having to do with labor relations in the bituminous-coal industry. The first was published in *Coal Age* in full last week; the recommendations from the second appear this week. These results of the Commission's study of labor relations are as disappointing as the subject is important.

The first report, despite its label as a study of the causes of strikes, is a discussion of the violation of civil liberties and as such is essentially concerned with the West Virginia situation. It is a rambling document, scrupulously disposed to deal the blows in equal measure to both parties; inconclusive on the big questions and leaving us no nearer the answer than before.

Murder, arson, assault, denial of free speech and liberty of person are the principal offenses against civil liberties and it is gathered from the context of the report that these are the matters under discussion. Herrin is elaborately described, treated as a study in mob psychology and charitably excused. The Commission "chooses to give . . . the benefit of the doubt as to criminal intent" to those non-union operators who have used force in keeping the union out of their mines, and to the union for its use of force in attempting to enter. Human passions, lax administration of the laws, racial characteristics, the "irrepressible conflict between the United Mine Workers and the non-union operators" are assigned as causes for strife, but not shown to have been causes of strikes.

The bone of contention in West Virginia, in parts of Pennsylvania, Utah and other soft-coal fields is the effort of the United Mine Workers to organize the miners, an effort opposed by the operators. Strife, not strikes, has ensued. These local affairs have had little or nothing to do with the stoppage of coal production; have caused no high prices or short coal supply to the public. For this strife and warfare the coal industry in these rich, unorganized fields has been haled before the bar of public opinion time and time again in the past. What the public expects from the Coal Commission, if it expects anything here, is judgment on these moot points. It is not vouchsafed.

The coal industry itself would welcome a solution of this perplexing problem—the non-union operators one that would keep the union out and let them work in peace; the union one that would let it in. The rights of each are stated, that of the operator to have no union men and that of the union to get in if it can, and then "the Commission believes . . . it is their [the operators'] patriotic duty to make some personal sacrifices in the interest of the common weal, a principle equally applicable to the United Mine Workers."

What sacrifices? What sort of thing are they to do? The non-union operator in West Virginia reading this remarkable document must be tormented by doubt. He is patriotic—what shall he do? Any sacrifice that he may make is to let the union in. And the union, it too is patriotic. What sacrifice can it make, save to forego its right to push its organization? Does the Commission see some middle ground on which, by making mutual sacrifices, peace may be had, and both satisfied, and if so, why not state it? All that the Commission has offered is that the law must be enforced, if necessary by the federal government. In other words, all that it offers as the solemn judgment of six men, after long study of this most vital question,

is the Marquis of Queensberry rules for a fight. That is why we say that its report is disappointing.

Turning to the second document, we find a detailed, scholarly, able study and discussion of labor relations and the causes of strikes. It is true that the civil liberties report slops over onto the subject of strikes at times and thus overlaps the second, giving evidence of independent preparation and subsequent lack of coordination. Incidentally, this second report contains, among its thirty-seven specific recommendations, several that should have been considered in connection with the problem of violations of civil liberty and peace in the non-union fields. The report on labor relations is as easy to follow as the other is difficult; the conclusions follow from the text. While everyone will not agree with these conclusions he has the opportunity of reading the evidence.

Arguing that charity begins at home, this report starts with causes of friction at their source and devotes nineteen, or half, its recommendations to suggestions for amelioration of those causes. With most of these no fair-minded operator or unionist can well disagree. The suggestion, for instance, that there should be a check weighman at non-union mines will not find favor with the non-union operator, not because he would be unfair to his men but because of his belief that such an innovation presages the union itself.

On the check-off the Commission straddles. Repeatedly urging the inherent right of a man to work without belonging to the union, it finds not that the check-off does not prevent the exercise of that right but that it should not. It recommends compulsory investigation before there be strikes, and voluntary arbitration, both sound as far as they go. It *regrets* that the United Mine Workers has given so little attention to fundamentals and *thinks* the union is facing a critical transition period, but in what direction it does not say. It doubts the value of incorporation of the union and is silent on the question of compulsory secret strike ballots.

Both documents have an abundance of sound reasoning in them, with ample preachments, plenty of platitudes, and little punch. The Commission has failed to grip the problem of the United Mine Workers as it now overpowers the coal industry and the public coal supply. Certainly it had ample evidence of the big strikes of 1919 and 1922, their causes and effects. Those are the kinds of strikes the public wants to know more about. Whether the responsibility was with the profit-seeking operator or the power-mad union official, the Commission should have dragged the offender forth by the scruff of the neck.

What is the Commission's answer to the challenge of the union that President Harding said had this country at its mercy? If compulsory advance investigation and publicity of accounts will stop a big strike, why didn't it stop the Sept. 1 strike in the hard-coal fields? If six commissioners, \$600,000 and six months' investigation isn't enough for the purpose, in goodness' name, how many millions must we have? What is the use of going out of its way to pillory a few jobbers for grabbing off a few hundred dollars extra profits in pyramided sales of anthracite in New England and then let the union and Governor Pinchot put millions on the whole output?

The Coal Commission's reports on labor are disappointing, not for what they say but for what they fail to say.

Village of Gamerco, N. M., with Navajo No. 5 in Rear.

Machine Shop, Bathhouse, Houses and Other Accessory Buildings at the New Gallup American Mine*

Arrangement of Repair Shop—No Overhead Crane—All Lifting Done by Chain Blocks on Trolley Track—Bathhouse Uses Overhead Hanger System—Reason for This Practice—Brick on Edge Used for Houses

BY H. B. COOLEY

General Superintendent, Allen & Garcia Co., Chicago, Ill.

LARGE plants like Navajo No. 5 of the Gallup American Coal Co. require an exceptionally complete shop equipment, especially when they are located, like that plant, over 200 miles from a town where a foundry and machine shop is available. This means that provision must be made for all the repair and maintenance work needed by the mine, tippie and power plant. All lathes and large shop tools have been selected with the view of providing for the special types of work which such a plant would require, and so far as possible individual motor drives have been installed. However, overhead line shafting is not entirely eliminated, and provisions were made in the design of the roof truss for its support and for that of the forge blowers and an exhauster.

Whether to combine the storeroom with the shop

*This is the fourth part of Mr. Cooley's article on Navajo No. 5 mine. The others appeared in *Coal Age*, Aug. 2, Aug. 16 and Sept. 13.

building is a question that usually requires close study. If the storeroom is planned with a view of housing general mine supplies such as machine parts, bolts, etc., and in addition bulk material such as lumber, cement, etc., its size usually runs to such large proportions as to make it difficult to combine it with the shop building. If, on the other hand, a separate building is erected the supplies and materials used in the shop are not being stored conveniently to the place of use.

It is believed that the arrangement adopted at No. 5 has the advantages of both. Referring to the general plan, Fig. 1, it will be seen that part of the shop building is devoted to storage purposes. This space houses the usual supplies and equipment that are used in the shop and mine. The storekeeper has offices in this building, and all materials, as well as shop tools, are issued by requisition. The convenient location and arrangement for issuing supplies makes this system ideal, as by it much time is saved and trouble avoided.

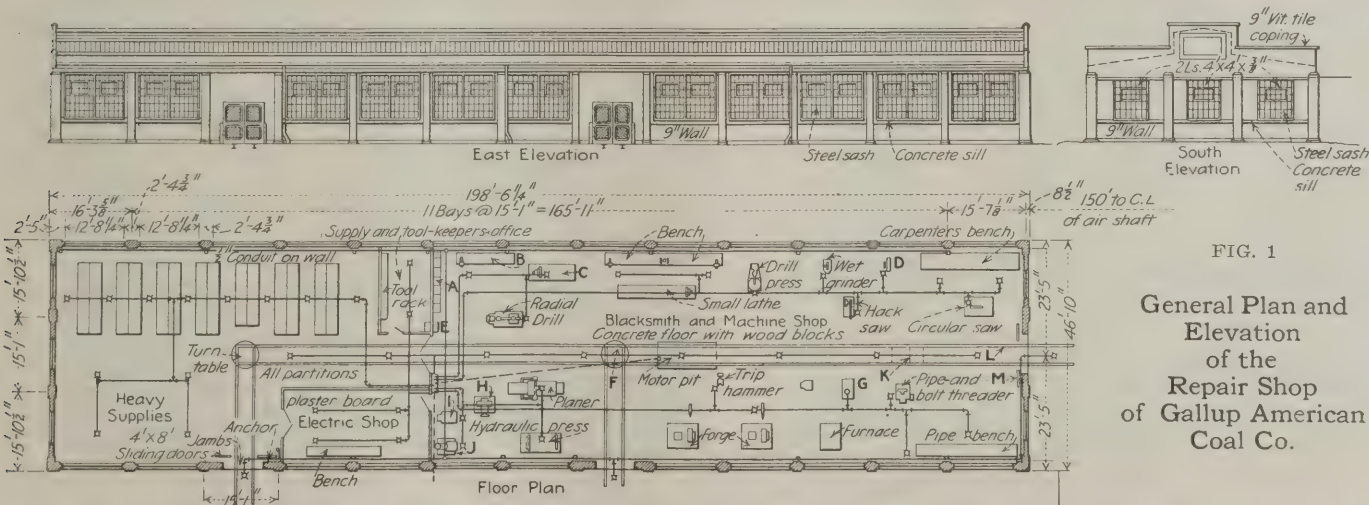

FIG. 1

General Plan and Elevation of the Repair Shop of Gallup American Coal Co.

The plant is equipped with trolley tracks instead of a crane. By means of hand-power hoists the parts can be lifted and moved along the trolley tracks on the lower

chord of the roof trusses. A is a steel locker; B is a bench; C, a large lathe; D, a grindstone; E, tool window; F, industrial track; G, a bending frame; H, a milling

machine; I, a shaper; J, a keyseater; K, track separators, 3 in. diameter set at 4-ft. centers with four bolts; L, 40-lb. rails set at 40-in. gage; M, 4 x 8 ft. sliding doors.

FIG. 4—WASHHOUSE AND MACHINE SHOP; AUXILIARY AND MAIN TIPPLE IN REARGROUND
The well-lighted machine shop attracts immediate attention, nearly all the walls being glass above bench level, the light being supplemented by sash in the monitor

prove that "per man" the locker system requires no more room than the hanger system. But observation has shown that congestion is much more apparent in a clothes room containing lockers than one where the floor space is clear except for benches. In fact in designing a washhouse it is well to see that the men have not only a place to put their clothes but enough room in which to change them conveniently.

The hanger room has 2,664 sq.ft. of floor area and the ceiling is arranged for carrying 510 hangers. This allows 5.2 sq.ft. per man, the hangers being spaced 2 ft. apart from center to center.

The washroom is placed at one side of the hanger room and contains twenty-eight showers. There are four rows of showers, spaced seven in a row, with 4 ft. 3 in. between each shower head and the next. A 2-in. wood partition covered with zinc on each side prevents splashing and serves as a carrier for the shower heads.

Hot water is obtained from a 500-gallon storage tank located in the basement, with a heating capacity of 1,500 gallons per hour. It has a thermostatic control, and the water temperature is maintained constant during the peak periods of its use. Steam at 175 lb. pressure is taken from the main steam line and reduced to 15 lb. by means of a reducing-pressure valve. This

steam is used to feed the coils of the water heater; and this condensate, together with that from the heating coils, is all returned to the boiler room.

At one end of the building is a modern first-aid room where minor injuries can be treated or where in case of serious injuries the patient can be given temporary care until the doctor arrives and the injured man is taken to the hospital. At the other end of the building is a bosses' shower and a change room which is amply large not only for the management but for the accommodation of visitors.

The same general type of construction is used for the washhouse as for the shop building, and provisions are made for increasing the capacity without changing the general scheme.

An essential part of the development of a mine in this field is the housing of the employees. The mining camps adjacent to the present workings of the company are well established, and their abandonment of course will be gradual. However, it is planned ultimately to consolidate the three old camps with the new town, and careful plans have been made for so doing. Fortunately, the surface adjacent to the mine site lent itself admirably to a town plan. The entire town site is on high ground overlooking a broad valley, with just

FIG. 5—INTERIOR OF MACHINE SHOP

The lower chords of the trusses are arranged to act as overhead trolleys for handling material. Thus the space is not interfered with by the presence of a crane. Many of the drives are electrical, but, as will be noted, some are through belting.

FIG. 6—INTERIOR OF HANGER OR DRESSING ROOM

Hangers are spaced at 2 ft. centers. Lockers are used only in bosses' dressing room, the overhead hangers being advocated as giving freer space for dressing. Rapid drying of clothes, which this method favors, is not needed at mines so dry as this.

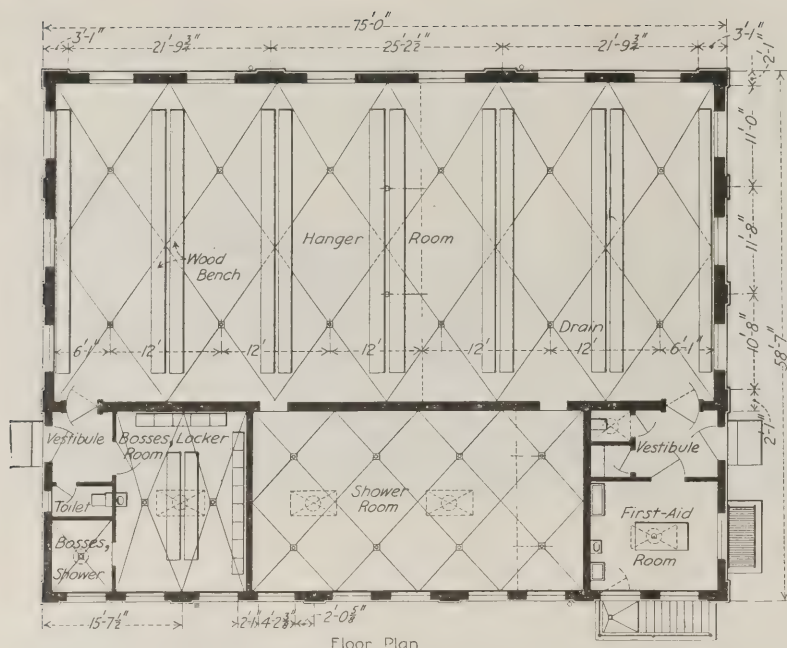

FIG. 6—PLAN AND CROSS-SECTIONAL ELEVATION OF BATHHOUSE

The bossers' shower is separated from the bossers' locker room by a canvas curtain. The interior of the hanger room is 35 x 72 ft. 2 in. The shower room is 20 x 36 ft.; the bossers' locker room 14 ft. 3 in. x 20 ft. and the first-aid room 12 x 14 ft.

enough variation in surface contour to relieve the monotony and provide excellent drainage.

The street layout, the pole lines for lighting, the sewer and water lines have all been planned and the construction program arranged along definite and predetermined lines, so that the ultimate development will present a systematic and practicable arrangement.

One of the features to be considered in this field is the diversity of races. In addition to the usual nationalities common to the average mining camp, we find the Mexicans in large numbers and the Navajo Indians ranging in number from 1 to 5 per cent of the total. The Mexicans prefer to live in more or less segregated quarters, and a Mexican village has been started somewhat apart from the main camp. The Navajos build their own "hoogans," and the solution of their housing problems does not rest on the mine owner.

An entire block has been reserved for school purposes. All the frontage on Navajo Ave. from First to Fifth Streets is reserved for company buildings and houses. A clubhouse, a hospital, executive offices, etc., are some of the buildings that have been erected on that reservation. All of these facilities are now located either in the other camps or in the town of Gallup, and mention will be made of them later.

A government post office was established early in the development period and the name Gamerco (Gallup AMERICAN COal) was used to christen the town and post office. A rooming house accommodating 40 men and a boarding house for about double this number were the first buildings erected on the new town site. These buildings have all modern facilities, steam heat, electric lights, toilet and bath, and are maintained under excellent management.

The standard type of miner's house is shown in Fig. 10. The question of what material to use in their construction was only decided after the building of several "experimental" houses. The use of adobe brick is not unsuccessful in this climate and is quite generally used among the natives. Buildings of this material are far from being vermin proof, and it was this objec-

tion that eliminated the use of adobe. Concrete block construction was too expensive and the experimental houses were built, one of frame and the other of brick with stucco coating.

The local brickyard was manufacturing a rather porous and comparatively inexpensive building brick. Standard brick from this yard were laid up on edge instead of flat, using the "Ideal" method of erection. This type of wall reduces the number of brick required approximately one-third and gives a hollow wall which can be plastered without the use of furring. After comparing initial cost, maintenance, depreciation, etc., the brick wall with stucco interior was adopted.

With the consolidation of the mining work, houses will be available at the other camps, and these are being moved to Gamerco. The entire Heaton camp has already been transferred to the new town site by means of two 5-ton auto trucks and a specially built carriage. The average distance the houses were moved was two miles, and the rate of moving was two houses per day.

At present there are approximately one hundred houses available at the new camp, all equipped with electric lights and modern conveniences. As yet there are not sufficient dwellings at Gamerco to house the employees at Mine No. 5, and those who live in the other camps are taken to and from their work in busses which are provided without expense to the employees.

Excellent school facilities are provided for all children under high-school age. A modern kindergarten is maintained at the Gibson camp and the bungalow type of school building has been adopted at Gamerco. Fig. 12 shows one of two such buildings now in use, it having been deemed more advisable to build the schools in small units of two or three rooms each, as needed, rather than to have one large building. After the students finish the eighth grade it is necessary for them to go to Gallup to attend high school. The distance is about $3\frac{1}{2}$ miles, and bus service is maintained by the coal company without charge to the students or their parents. Athletic sports are encouraged and playground facilities are being provided.

Despite the difficulties and cost of obtaining water, which as has been mentioned, is pumped from deep wells, an ample supply is furnished for camp use. All of the newer tenant houses are provided with running water, toilet and bath. This is also true of the board-

FIG. 8—CROSS-SECTIONAL ELEVATION OF BATHHOUSE

The floor consists of 5 in. of concrete, laid on a 1 in. bed of cinders. In order to make the surface smooth for the barefooted a surface of cement 1 in. thick covers the concrete as a finish.

FIG. 9—DETAIL OF CLOTHES SUSPENSION METHODS
There are 85 hangers in each bay and 68 I-bolts in the back of each bench. The benches are 29 ft. 1 1/2 in. long.

ing houses. The miners' washhouse is freely used. Insofar as possible, wastefulness of this fluid, so precious in the desert country, is discouraged, but no attempt is made to curtail the supply. An outdoor swimming pool 35x75 ft. has recently been constructed of reinforced concrete. This is a convenience which is greatly enjoyed, not alone by the children but by the grown folks as well. The use of the tank is free to employees and their families.

Sewage disposal is taken care of by septic tanks placed in convenient locations with respect to the drainage lines. The effluent from these tanks all flows to a deep arroyo some half mile from the town site, and it is surprising how quickly the water disappears in the soil of the desert "washes."

The mine safety station is equipped with eighteen Draeger helmets, twelve of the large two-hour type and six of the small half-hour type. It is planned in the immediate future to change the large Draeger helmets for other equipment. The auxiliary apparatus is quite complete and includes a pulmotor, inhalators, an electrically driven oxygen pump, large supplies of regenerators and oxygen, a portable mine-rescue telephone, safety ropes, fire hose, safety lamps and flashlights.

The station also is equipped with apparatus for the collection and analysis of samples of mine air and gases. Large supplies of material for first-aid work are kept and frequent instruction is given to classes in first aid to the injured. A large number of men have been trained both in mine-rescue work and first-aid, which training is being carried on as deemed necessary. Regular and systematic inspections of the mines are made with a view to avoiding accidents, and safety committees have been organized among the employees and foremen.

The first-aid and helmet station is under the direction of L. Kuhns, who has shown unusual ability not alone in the management of the rescue station but in the training of first-aid teams and the organization of safety-first movements. Mr. Kuhns' work has been recognized throughout the State of New Mexico, and the U. S. Bureau of Mines places his work at the head of the list in that state.

In the list of equipment a portable mine-rescue telephone was included. This is indeed a unique piece of

apparatus. It consists of a complete self-contained telephone system, the entire outfit being housed in a chest much smaller than the ordinary steamer trunk. The main cable is on a reel built integral with the housing. The portable cable is on small reels about 4 in. in diameter and 8 in. long. These carry about 700 ft. of wire.

In order that they may be used in connection with helmet apparatus, special transmitting and receiving apparatus have been designed. The transmitter, instead of gathering the vocal impressions from the mouth, is arranged for attaching to the throat exactly over the Adam's apple. An interesting use for this apparatus was discovered by the engineering force during the progress of a mine fire.

In one of the older portions of the mine a fire in the upper coal measures suddenly developed in such proportions as to make it necessary to abandon one of the main entries. To drive a new entry required a survey running through this smoke-filled territory. By the use of helmets and with the aid of the portable telephone the survey, with necessary elevations, etc., was easily completed and all the data obtained for driving the new entry.

In fairness to the present management it should be said that no survey under such difficult conditions will have to be made at any time in the future, as all roadways are projected well in advance and, moreover, elevations are recorded in all parts of the mine.

The coal company maintains a movie theater, where

FIG. 10—PLAN OF THE STANDARD MINER'S HOUSE
In this dry region with no water till immense depths are reached and then not a copious supply, it is pleasing to see such complete bathrooms. The houses are of brick. Note also the generous closet room and the pantry. The West certainly sets standards of living. The pioneers are not long in getting back to "creature comforts."

FIG. 10—HOUSES LIKE THOSE SHOWN IN FIG. 9

The brick walls are covered on the exterior with stucco. Note the trusty electric poles in contrast to the twisty native growth so characteristic of arid regions.

first-run films of the better class are shown three times a week. This building also is available for dances and other public gatherings. Outdoor sports are encouraged and the Gamerco baseball team is surpassed by few in the state. An excellent ball ground is maintained by the coal company and concrete tennis courts have been built for employees' use.

Horse races and other sports also are held at the ball park, the Navajo Indians taking no small part in these diversions. Clubhouses equipped with pool tables have been erected at the Gibson and Navajo camps. Soft drinks, ice cream, etc., also are sold at these clubs. They are operated by a concessionnaire under the general supervision of the company.

To Horace Moses, general superintendent; J. E. Hanes, assistant superintendent, and C. E. Williams, electrical engineer, is due most of the credit for the handling of the construction work and the approval of the engineers' designs. J. M. Sully, managing director of the Chino Copper Co., had no small part in planning the original layout and greatly assisted in the solution of many of the engineering problems. E. J. Franklin, consulting mechanical engineer, deserves much credit

FIG. 11—BUNGALOW "UNIT" SCHOOLHOUSE

The "unit" type of schoolhouse has been favorably received in the West though some still advocate large schoolhouses of many rooms. It will be seen that this schoolhouse though small is substantial and cheerful with the windows becurtained—a self-respecting place in which to learn the duties of good citizenship and to obtain sound learning.

for his advice and assistance in the planning of the power plant. All of the material used was purchased direct by the company's organization, R. E. Clark, of Salt Lake City, having handled practically all of these matters. The engineering work was done by the Allen & Garcia Co., Chicago, Ill.

E. D. GARDNER, MINING ENGINEER OF THE U. S. BUREAU OF MINES, recently spent several weeks in the vicinity of Denver, Colo., conducting tests with liquid-oxygen explosives. Besides making field tests, considerable work has been done toward developing a new low-cost cartridge as a carrier for the liquid oxygen.

Book Reviews

Mine Examination Questions and Answers

CATECHISMS are always interesting to a large section of the reading public. Psychologically they have the great advantage that they attract the attention of the reader. Asked a question one is spurred to find an answer, which in a catechism one does by reading further. When merely confronted with a title or caption one is not faced with the apparent necessity for making a reply or of taking a measure of one's mental ability, and not being convicted of any defect of knowledge is not intrigued to read the solution presented. In many instances a question leads almost two-thirds of the way to knowledge, and the man who knows how to question is likely to be well instructed because he has set in motion impulses to thought and to inquiry. The bulk of any man's knowledge, especially the more worthwhile part of it, comes from questions asked and answered, whether of himself or some other man or of a book.

A book has just been published containing three volumes of questions—not propounded by the author but put for the puzzlement and bedevilment of those who seek to be mine foremen and answered by James T. Beard, who has a happy faculty for expression and a power of simplicity in explanation. The question and answer method being the best method of teaching and the teaching being kept strictly within the domain of questions already asked of candidates for mine inspector, mine foreman, assistant foreman or fireboss, the book is eminently practical.

All of these qualities might have been spoiled if the questions had not been properly grouped. Attention has been given to this point. A series of questions relate to air, another series to the chemistry of gases, a third to specific gravity and weight of gases, and so forth. Thus we have a veritable textbook arranged in as orderly a manner as if the questions in the catechism as well as the answers had been written by the author instead of culled with infinite pains from the many actual examination papers which inspectors and others prepared for the quizzing of postulants for places of authority in the mines of the various states and provinces of North America. There are 2,975 questions in the three volumes. The presentation of them and of their answers takes 846 pages measuring 5½x8½ in. This is followed by an index of 26 pages, making it easy to find any kind of information covered.

The minds of all of us need restocking. As time goes on information of earlier years slides gently from the brain cells in which we had it confined or becomes encysted so that it is no longer of any use. This book will be of help to the superintendent who wants to refresh his memory with the fundamentals of mining problems or who was graduated to his position without either college education or the experience and "booking" that a mine foreman receives. It has a yet more vital interest to those around the mines who desire to obtain certificates of competency.

The book which is bound in cloth, is published by the McGraw-Hill Book Co., 370 Seventh Ave., New York City.

What Equipment Should Be Provided for Hoisting Men And Ventilating Mine When Electric Power Fails*

Discarded Boilers Should Not Be Used for Such Purposes, as Maintaining Steam Pressure Is Too Costly—Gasoline Engines Preferable—Small Engines Fit Slow Speed and Light Hoist Loads in Raising Men

BY GRAHAM BRIGHT

Pittsburgh, Pa.

BEFORE the advent of central stations all coal and metal mines generated their own power, and in many cases these isolated power plants gave a fair continuity of service, which central stations with their long transmission lines often failed to do. In coal mines that produce much gas, it is essential that power be available at all times for operating the ventilating fan and also, wherever the mine is of the shaft type, for driving the hoist. With an isolated power plant and gaseous shaft mine even if trouble should develop with the fan a disaster is not inevitable, for the men can be hoisted quickly. On the other hand, if trouble develops with the hoist, the fan can be kept in operation, and there will be no necessity for haste in getting the men from the mine.

Central-station power is now being used extensively for mine plants and the discontinuity of the service which is sometimes in evidence with power of this kind has unusual importance for the operators of gaseous mines. Inherently the central station is much more reliable than any isolated plant, but trouble may occur on the transmission lines and in consequence no power may be transmitted for a long time.

For this reason some mines have kept their steam equipment intact and ready for operation in case purchased power should fail. This is an expensive procedure, for the boiler plant must be kept fired at all times so that emergency power will be quickly available.

GASOLINE-DRIVEN GENERATORS OFTEN USED

In many instances generators driven by gasoline engines have been installed to furnish emergency power for the service hoist. As most of these are of the alternating-current type the generator of the set thus driven usually is of the same type and is arranged to drive the service hoist motor at full speed, or an extra motor is provided that can be thrown into gear on either the main or service hoist and the hoist operated at a greatly reduced speed. This latter arrangement is used because large gasoline-engine driven units are difficult and expensive to obtain and install.

I recently developed a plan by which the main hoist and the fan can both be operated at reduced speeds, in case the power from the central station fails. In this plan the gasoline-engine driven generator operates at a reduced frequency if alternating current is used, and at a reduced voltage if on a direct-current system.

With alternating current the engine speed and generator are arranged to give a frequency of approximately one-half the normal frequency, but this can be varied to meet the particular conditions at any mine. In case

the generator operates at 30 cycles the voltage will be 1,100 if the hoist and fan are operating on 2,200 volts, 60 cycles. The motors will then operate at one-half speed with the same control and will give a fair power factor and efficiency, for the voltage has been reduced in the same ratio as the frequency. In operating the main hoist in many cases the load of men will be about one-half of the load of coal or ore. As, in addition, the speed is reduced one-half, the power required will be about one-fourth of that necessary when hoisting coal or ore.

When the fan is operating at one-half speed it will supply sufficient air to keep the mine clear for a short time and will require from one-fifth to one-sixth of the power necessary to operate at full speed. By adjusting the engine speed and voltage the fan speed can be increased to 60 or 70 per cent of the full speed, if this is necessary.

Let us assume that during normal operation the main hoist will require a maximum of 600 hp. and the fan 150 hp. Assuming that the load of men will weigh one-half as much as the load of coal or ore, the power required for the hoist at one-half speed will be approximately 150 hp., and the power for the fan 30 hp., making a total of 180 hp. This power could be readily supplied by the gasoline-engine driven unit having an engine of approximately 250-hp. and a generator of about 150-kva. capacity.

Should it be desired to operate the service hoist, a

FIG. 1—APPROXIMATE HOIST CYCLE, MANIFOLD NO. 2.

The power at this hoist in normal running is 60-cycle alternating current at 2,200 volts. That is only necessary when the hoist is under the normal load, that is, lifting coal or rock and running at maximum hoisting speed.

*Paper prepared for the field meeting of the American Institute of Mining and Metallurgical Engineers and for lack of time presented by title only at the session of Aug. 30, held in Montreal, Que.

FIG. 2—APPROXIMATE HOIST CYCLE AT SAME MINE.

Here the hoist is raising only men and doing it at about half the normal running speed, the power being reduced in proportion to the reduction in load and velocity. Note that the scale of this illustration in seconds, horsepower and rope speed is greater than in Fig. 1, thus disguising the relative magnitude of these factors.

reduction of about 25 per cent would possibly be more desirable than 50 per cent in which case both fan and hoist would be operated at 75 per cent of full speed.

The operation of this system would be very simple, in that no change would be required in the control system of either the hoist or the fan motor. In case of failure of power the gasoline-engine driven set can be started by means of a push button and when a double-throw switch is thrown, power at reduced frequency is available for either the fan or the hoist. If the fan has automatic control it can be placed in operation within 30 to 60 seconds after the power fails.

An outfit similar to that described will soon be installed at one of the mines of the Youghioghenny & Ohio Coal Co., near Pittsburgh, this mine having shafts fairly close together, each equipped with a 400-hp. 2,200-volt three-phase 60-cycle hoist motor and a 150-hp. 2,200-volt three-phase 60-cycle fan motor. Fig. 1 shows the normal cycle when hoisting both coal and slate. Fig. 2 shows the hoisting cycle when handling men and using power from the gasoline-engine driven generator at 30 cycles. This cycle indicates that about 140 hp. would be the maximum demand on the generator for hoisting.

FIG. 4

Gasoline-Driven Alternator

A generator run by a gas engine would avoid the necessity for keeping boilers under steam at all hours ready to take up the work should the purchased power fail. This illustration shows a 175-hp. gasoline engine driving a 100-kva. alternating-current unit.

Both hoists could be operated from an engine-driven set of sufficient capacity to operate one hoist if it is arranged that both hoists are not operated at the same time. This could be taken care of by a signal system, which would permit one hoist being operated while the other hoist was loading and unloading. As each fan would require about 25 hp. at one-half speed, one gasoline-engine driven generator could supply power for both fans and both hoists.

The capacity of the set being installed is 250 hp. for the gasoline engine and 175-kva. 1,100-volt three-phase 30-cycle generator operating at 900 r.p.m. This generator will be equipped with a voltage regulator, which is essential when using an alternating-current generator with this type of drive. Fig. 3 illustrates a gasoline-engine driven generator of the direct-current type. The speed of 900 r.p.m. is a little low for a high-grade gasoline engine, but was selected largely because a two-pole generator was not available.

With a two-pole generator the speed could be 1,800 r.p.m. This speed may be somewhat high, but if it

FIG. 3—GASOLINE-ENGINE DRIVING MOTOR.

This motor is of direct-current type. If direct current is used with field control on the hoist motor an engine of higher speed can be selected, thus reducing its cost and weight.

could be obtained would greatly reduce the cost of the gasoline engine. The two-pole generator, however, does not lend itself to increase in speed over 25 cycles, which may in many cases be desirable. With a speed of 900 r.p.m. the gasoline engine is capable of operating up to 1,200 r.p.m. if conditions at the mine warrant this increase in speed and frequency.

If direct current is used at the mine with field control on the hoist motor, an engine of higher speed can

be selected, which will reduce the cost and weight of the gasoline engine. This is important, as the engine is much more expensive than the generator. By means of field control, heavy torques for starting can be obtained with little power required from the engine itself. The engine can be worked up to its full capacity by selecting the proper voltage for the generator. If necessary, the generator can be equipped with a differential compound field which will automatically prevent overloading the engine. The control of this equipment would be simple and would not require any change in the control equipment of the main hoist or fan.

Using a gasoline-engine driven generator at reduced frequency on reduced voltage is much less expensive than retaining the old steam equipment and keeping it ready for emergency use at all times, or using gasoline-engine driven generators at full frequency and full voltage. By selecting a high-grade engine and generator, the equipment should be ready for instant service and should take satisfactory care of the supply of emergency power in case the power from an outside source should fail.

Standard Mining Machine Readily Adapted To Conditions at Spadra, Arkansas

THE peculiar conditions under which semi-anthracite is mined in the Spadra field, Arkansas, has already been described in *Coal Age* in the issue of March 15, 1923. They have been met by the construction of a mining machine especially adapted to the needs of that region. At Spadra is found a bed of coal 40 in. thick and characterized by a center band ranging from a hairline to 4 or 5 in. in width. The solid shooting which formerly prevailed broke 70 per cent of the coal to screenings, for which ordinarily there is little market.

After a long battle with the miners' union, a scale was adopted for the operating of machines and the introduction of these has since reduced the proportion of screenings to less than 40 per cent of the whole output. Unfortunately the market has not absorbed enough coal this summer to raise the average running time in Arkansas the 20 per cent expected. However, in the Spadra field and in that alone the running time has been somewhat improved over that prevalent when coal was mined by solid shooting.

Though the field is small, ten of its mines already are using machines. One of these employs continuous undercutters working along the bottom of the seam

MAKING SUMPING CUT IN CLAY PARTING OF SEAM

The machine adapted for the Spadra field is only 19 in. high, but, mounted on a skid, it can be raised or lowered to bring the cutter bar into position. The uniformity of the parting makes this an easy matter.

CUTTING ACROSS THE FACE OF THE ROOM

The machine, making a 5-in. kerf, practically cleans the Spadra coal, for the parting is seldom thicker than the cut and there is little other removable impurity in the whole seam.

but the other nine mines operate a continuous overcutter called the Sullivan CE-11, which is an adaptation of the manufacturer's CE-9, a combination low-bed room-and-pillar and longwall machine. Because the Spadra characteristic parting is found from 13 to 24 in. above the floor, the cutter bar of the original type of undercutting machine was swung around 180 deg. on its hanger so that the bar would be in line with the top of the machine frame instead of at the bottom of it.

When not resting on skids the machine is 19 in. high and when mounted on a standard self-propelling truck stands 30 in. high above the track. A drop axle also is available. This reduces the height of the cut to 24 in., thus varying the level at which the machine makes its cut. Consequently by care in operation it

SOLID SHOOTING PRODUCED NO LUMPS LIKE THESE

One of the Spadra field's many handicaps was that before the adoption of machines the slack proportion ran as high as 80 per cent in places, though the market for screenings usually was poor. The machines have reduced the proportion to less than 40 per cent. Augers have been placed on top of the coal to show that the coal has broken neatly from the roof.

can be made to excavate its 5 in. in the dirt parting wherever that may happen to be. The cutting process cleans the coal before light shots, placed in the top and bottom, loosens it in big lumps. The location of the parting is so uniform in each mine that a non-adjustable type of skid was adopted. Slight variations are satisfactorily met by skidding the machine up on props or cap pieces.

Even though, in modifying the older type of machine for Spadra conditions, the cutter bar was reversed from bottom to top, the drive sprockets and gearing were so reconstructed as to permit the operation of the chain in the normal direction. In other respects the machine is the same in handling and in mechanism as the standard undercutter. It works equally well in room and longwall faces.

New Equipment

A New Gasoline Dipper Shovel

A GASOLINE-DRIVEN power shovel operated entirely with gears and shafts is the latest improvement in this type of machinery announced by the Orton & Steinbrenner Co., of Chicago, Ill., and Huntington, Ind.

On account of the development of the gasoline motor various schemes have been put forward during the last few years in the attempt to adapt this form of power to a dipper shovel. The principal difficulty was that it became necessary to provide an arrangement to take the place of the independent source of power for the reversible crowding motion of the dipper stick.

The positive gear drive on the Orton & Steinbrenner Co. shovel is simple and the number of parts few. At the bottom of the boom connection is a shaft carrying double steel bevel gears and bronze friction clutches. This shaft is concentric with the pivot of the boom and consequently is independent of its position. The boom can be used at any angle to suit the exigencies of the work. A practical shovel-man can readily see the great advantage of this arrangement.

Along the boom is a steel shaft carrying two bevel pinions, one meshing at the bottom with the gears on the horizontal shaft, and the other at the top meshing

GASOLINE ENGINE DRIVEN SHOVEL

The main advantage of this shovel is that it includes its own power plant and drive; no boilers or power house being necessary.

with gears on a countershaft located about half way up the boom. This latter shaft carries a brake and "slip friction," and is geared directly to the cast steel rack on the dipper stick.

With this method a minimum number of levers are required, the operator being at ease all the time and not subject to fatigue. The simplicity of parts also is of great advantage in converting the shovel into a clamshell outfit, dragline or skimmer rig.

The power is supplied by a heavy-duty 4-cylinder "Climax" motor, which is designed with a view of economical use of gasoline.

Another exclusive feature of the machine is the flexible crawling tread. Full advantage has been taken of the experience gained in the design of tanks used in

the World War. It was proved conclusively that flexibility and lubrication of the tread and tread rollers was absolutely necessary to their operation. Experiments and developments during the last few years prove the absolute soundness of this type of construction. These flexible treads adjust themselves readily to the ground surface, equalizing the weight of the machine and distributing it over a considerable length of tread, instead of concentrating it on one roller or tread casting.

Alemite fittings are used exclusively in lubrication. These provide the quickest and most effective means yet devised for getting the grease into the bearings. Steering is accomplished by one man in the cab. The drive is by means of steel shafting and bevel gears throughout.

On the main horizontal drive shaft are two brake wheels by means of which each tread may be operated independently or both may act together. The mechanical differential arrangement is exactly similar to that used on automobiles.

To use it as a crane it is only necessary to take off the shovel boom and attach the crane boom; the crowding frictions for operating the dipper, being carried by the shovel boom and an integral part of it, are removed with it. When furnished with double drums the shovel can be used interchangeably with the crane. With the crane boom attached, any of the various types of buckets or scoops can be used, such as clamshell, dragline, skimmer scoop, or trench hoe; pile driver leads may be swung from the tip of the boom.

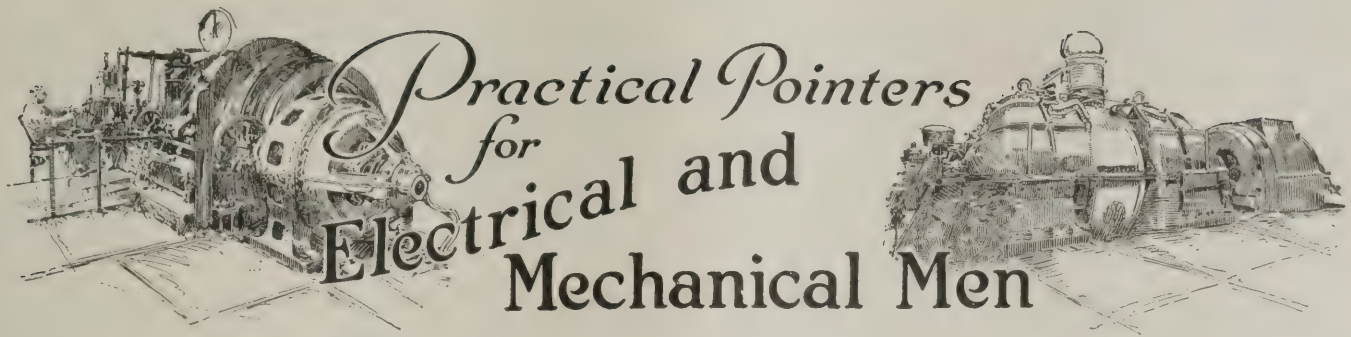

Portable Coal Loader

A PORTABLE belt conveyor particularly applicable to the handling of coal is shown in the accompanying photograph. Shippers and coal dealers are effecting large savings through the use of mechanical loading devices. Therefore this particular conveyor doubtless will find a large field for application in coal handling. This conveyor, known as the "Cub" portable loader, is manufactured by the Link-Belt Co. and is furnished at a moderate cost.

LINK-BELT CO. "CUB" CONVEYOR

Portable conveyor 21 ft. long complete with underneath lowering mechanism.

Axle Collar for Keeping Gear and Pinion In Alignment on Locomotives

THE stress and strain to which electric locomotives in mining service are subjected necessitates some means for keeping the pinion on the motor shaft properly meshed and in alignment with the gear on the driving axle. Unless the gear and pinion are in alignment the teeth will not wear uniformly over the entire width.

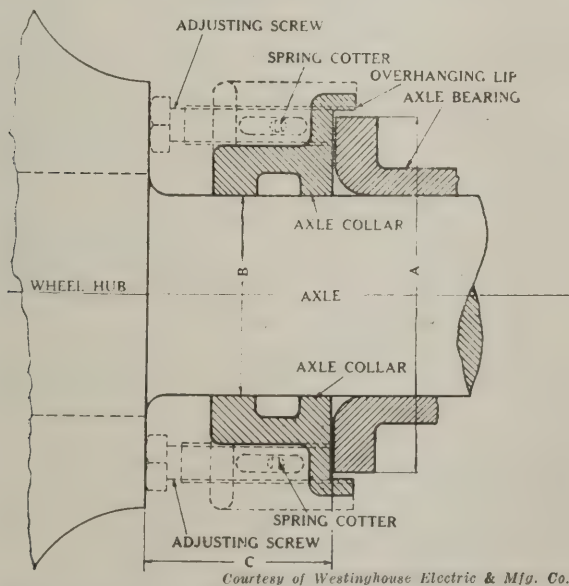

The function of an axle collar therefore is to keep the motor properly located on the axle so that the center line of the pinion on the motor shaft will line up with the center line of the gear on the axle. The length of axle collars is determined, first, by the distance between wheel hubs, which will vary on different cars, depending upon the track gage and the shape of the wheel at the hub; second, by the location of the gear on the axle, and third, by the over-all length of the motor at the axle bearings, which differs with the various sizes of motors. It can readily be seen that to meet these conditions will require a wide range of collars of varying lengths. Further, these different lengths of collars must be arranged with a number of bores made to fit the different sizes of axles found on the great variety of car equipments.

In the earlier equipments, non-adjustable collars that would just fill up the space on the locomotive axle were used. This type of collar was very satisfactory when the equipment was first put in service. However, as no

provision was made to take up the wear on the axle bearing flange, the motor soon developed considerable end play on the axle, resulting in rapid wear of parts and a tendency for the gear to cut through the side of the gear case. With this type of collar the end play could be taken up at least temporarily by releasing the clamping bolts and moving the collar over against the axle bearing and then tightening the bolts securely.

To provide a more positive and permanent means of taking up the end play due to wear, an adjustable collar was developed which was provided with an adjusting bolt, the head of which was backed up against the wheel hub. This bolt can be backed off the required distance to make the collar long enough to take up the maximum allowable axle bearing flange wear, after which the worn bearings should be replaced by new ones. This feature has been found to be of such value in keeping the motor properly located on the axle at all times that it is now being almost universally used in connection with all railway equipment.

The earlier axle collars were made of cast iron and fitted with a single adjusting bolt. They were made very heavy, being designed with a large factor of safety. During the campaign for light-weight equipments, the pressed steel axle collar was developed with double adjusting rods, and having the rubbing face reinforced with hard fibre rings to reduce the axle bearing flange wear. The experience of a number of operators indicated that the pressed steel collar was too light for this service and it was replaced by a heavier collar as shown in the figure herewith.

SECTION THROUGH ADJUSTABLE AXLE COLLAR

Use of Air Dome Prevents Breaking of Column Line Connection Pieces

BREAKS occasionally occur in the column lines of pumps in coal mines as in other industries. Under some circumstances these breaks have serious consequences, especially when the mine workings are making much water and the pumps are just about able to handle the large volumes which are continually running into the sumps. When the mine water is pumped to the breaker or washery for coal preparation, shutdowns to the pumps become more serious because the outside operations must also stop, thus throwing hundreds of men idle waiting for water. Even short delays are serious because the payroll does not stop when the pumps stop.

The illustration herewith shows the arrangement of three reciprocating pumps at the Cranberry Creek Coal Co. at Hazleton, Pa., which were used for the double purpose of dewatering the mine and furnishing a supply for outside consumption.

Occasionally some difficulty would arise with a pump

AIR DOME ON COLUMN LINE PREVENTS BREAKAGE OF CONNECTION PIECES

The air dome acts as a cushion to the surges in the line and saves the column line and connection pieces from breaking under the strain.

valve and a pump would miss a stroke and cause a surge or hammer in the column line. When this happened the surge sometimes was severe enough to break one of the laterals, resulting in the necessity of shutting down all the pumps, with delays to the outside force of men working on the preparation of coal.

To avoid the necessity of shutting down all the pumps when these shocks occurred, break pipes—pipe sections much thinner than the metal in the laterals—were placed between the valves on the discharge line from the pump and the pump itself, the idea being to have the break pipes break under the shock rather than the laterals. The break pipes were of metal $1\frac{1}{2}$ in. thick while the laterals were of metal $1\frac{1}{2}$ in. thick. Nevertheless, the laterals continued to break whenever a heavy surge occurred.

The difficulties were effectively overcome when the master mechanic, T. D. Stockdale, placed in the column line a T-connection to which was jointed a 10-ft. section of pipe the end of which was covered with a blank. This attachment is essentially a large air dome which is filled with compressed air from a compressor in the pumping station and whenever a surge occurs the air in the dome acts as a cushion for the water.

Neither laterals nor break pipes break with this large dome on the line and whenever the pump runner hears the least sound of any water-hammer he starts up the compressor and keeps the dome properly filled with air.

Motor Sizes on Electric Mine Locomotives

PLEASE explain in the columns of *Coal Age* how the horsepower of mine locomotives is determined. I also would like to know what would be the weight of a locomotive capable of developing a drawbar pull of 2,000 lb. What would the horsepower rating of each motor of such a locomotive be?

J. H. BLAIR,

Moundsville, W. Va.

On page 973 of the June 14 issue of *Coal Age* is an article entitled, "How Big a Load Can a Locomotive Haul." In the table on the same page it will be noticed that a locomotive capable of developing 2,000 lb. draw-

bar pull on the level would weigh 4 tons. The haulage capacity on the level would be 70 tons. On different grades the haulage capacity and drawbar pull of the locomotive decrease with increase in grade, as shown in this same table.

This table has been constructed for locomotives equipped with wheels having steel treads, for locomotives having cast iron wheels the values in the table must be reduced to 80 per cent of those shown in the table.

The standardization rules require that locomotive ratings shall be based on the running drawbar pull in pounds on the level, and speed in miles per hour that the motors will develop as determined at rated voltage.

From the above it is clear that the motor rating is a function of the speed of the locomotive when developing its rated drawbar pull on a straight, level track with dry rails. Therefore to determine the horsepower of the motors one must have data with reference to the speed.

However, for two-motor trolley locomotives running about 7 miles per hour at full rated drawbar pull the manufacturers are equipping the locomotives with motors which are rated so as to total about 8 to 10 hp. per ton of locomotive weight. From this it is apparent that a 4-ton 2-motor trolley locomotive would be equipped with motors capable of developing about 16 to 20 hp. each.

Locating Electric Switches in the Mines by White Markers

IN WORKING for a large anthracite company and by visiting the various collieries of the company I frequently observe different methods of doing the same thing. Some ingenious mind often invents a contrivance or hits upon an idea which accomplishes a given result much more efficiently or safely than it was ever done before. One of these ideas I am now passing on to the readers of *Coal Age*.

At one of our mines we have all our electric power switches indicated by two fairly long arrows, one parallel to the trolley wire itself, the other at right angles to the wire. The arrows are painted white so that they will stand out conspicuously against the black background. In case of an emergency, anyone, even a person unfamiliar with the location of the trolley switches, can readily see these markers and throw off the power. I believe that this simple idea will save the life of many a man and many a mine mule.

This is in line with the general safety measures which require that caution notices and warning signs shall be posted at points where such warnings and instructions will be most effective in reducing the hazard of danger from electric power lines.

We also have posted in every surface and underground station, and at the entrance to each mine, instructions for the restoration of persons suffering from an electric shock.

All employees who work with or on electrical apparatus should know how to carry out these instructions without delay.

By carrying on a campaign of Safety First we hope to reduce materially the number of accidents resulting from persons coming in contact with electric conductors switching equipment.

James T. Beard

Safeguarding Slope Mine from Seasonal Floods

Conditions Regarding Quicksand Warn of Danger—Two Plans Suggested—Another Mine Inundated for Lack of Needed Precautions

CONSIDERING the conditions described by Joseph Magdalena, *Coal Age*, Aug. 23, p. 291, regarding the seasonal flooding of his slope mine, I am impressed with the thought that he failed to recognize the imminent danger that surrounded the undertaking by reason of the presence of the bed of quicksand, which he says was 30 ft. in thickness.

The correspondent states that the slope was started in this bed of quicksand. His experience in that event, should have acquainted him with the conditions that prevailed and that should have been sufficient warning that trouble would be encountered later in the development of the mine. In view of the conditions described, it seems to me that the most practical method of lining this slope, to prevent the inflow of water and insure the best results, has not been adopted.

BARREL ARCH AS SLOPE LINING

It appears that, inasmuch as the quicksand was known to exist, a more efficient means should have been employed at the start. From my own experience, I would say the condition should have called for a barrel arch being constructed and carried the entire length of the slope, from the entrance or mouth to where the road reached the coal. The same construction should have been extended well into the coal, to make a good job.

It is my opinion that a 9-in. brick arch, or one of reinforced concrete, if properly constructed so that the lining completely covered the roof, sides and floor in the shape of a barrel, would have eliminated all future fear of trouble by reason of water finding its way into the mine.

Had such a form of construction been used I believe there would be no necessity now of considering the building of a steel door at the foot of the slope, in order to protect the mine from inundation during the wet season or in the event of a cloudburst.

OBJECTIONS TO DOOR AT FOOT OF SLOPE

The objection to building a door at the foot of the slope to keep the water out of the mine is twofold. In the first place, assume that such a door has been built and is closed in anticipation of a flood and that the slope is filled with water. In that case, the mine must be shut down for days or weeks, before the water can be baled out and the door opened for the resumption of work.

Again, a sudden cloudburst, or an increased inflow of water that is unexpected, may occur at a time when

no one is around that can close the door and the mine would then be flooded the same as if the door had not been provided.

In addition to the plan that I have already suggested, let me say that it might be good policy, in the present emergency, to sink a shaft at some point higher on the surface, while continuing the uninterrupted development of the mine through the slope opening. When the shaft has been completed and operations transferred to that location, a strong bulkhead can then be built at the foot of the slope, which would completely shut out the water coming from that source.

FAILURE TO PROVIDE PROTECTION CAUSES LOSS

The hazards that attend all such situations are too great to take any chances with human life and the destruction of property, to say nothing of the loss of valuable time and the needless expenditure of money. Failure to provide the necessary security where conditions prevail such as have been described, is nothing short of furnishing a mantrap that may some day prove fatal. Financially it is a losing proposition.

Before closing, permit me to narrate briefly what occurred at one mine of which I had charge. The company operated two mines located on opposite sides of the narrow-gage railroad running from Castle Shannon to Pittsburgh. I had charge of No. 2 mine. The slope dipped 3 per cent to reach the coal, while the mouth of the slope was not more than 30 ft. from the creek.

Having often pictured to myself the possible situation of my men at work in the mine at a time when the creek might suddenly overflow, I had a heavy folding door built just inside of the slope mouth. The work of building the door was nearly finished when the big boss happened around and wanted to know my idea in building such a strong structure.

APPEAL UNHEEDED BRINGS DISASTER

The need did not appeal to him and my suggestion that he do the same at No. 1 mine brought the reply, "Not on your tintype." The sequel can be told in a few words. A week or so later I was called from my bed at 2 o'clock in the morning and told that the creek was rising rapidly. Water was even then trickling down the slope.

It did not take me long to reach the mine and close the emergency door. Having done this, I started to get the men out through the fandrifft. There were twenty men at work in the mine at the time. Much to my surprise on reaching the surface, I found the water halfway up on the door that I had closed.

However, my work was ineffectual because of the superintendent's failure to protect the mouth of No. 1 mine in like manner. The water flowed into that opening and flooded both mines through the connecting entries driven between them.

Fighting Mine Fires with Carbon Dioxide

Attempt to extinguish fire with water under high pressure fails—Mine then sealed and carbon dioxide forced into the workings proves successful.

READING the interesting article relating to the use of carbon dioxide in fighting mine fires, *Coal Age*, July 26, p. 132, calls to mind an instance where this gas was used to extinguish a dangerous fire in one of the mines of this district. The record file of this fire is missing and cannot be located; but I remember how the work was successfully performed and the fire finally extinguished. The following brief account will probably be of interest.

The fire was discovered on the morning of Feb. 13, 1905, about 7 o'clock. On being notified of the fact, I hurried to the mine and found it burning briskly at three points marked A, B, C, in the accompanying figure.

No time had been lost in taking steps to get water to the fire. A stream under high pressure was used in the

attempt to check the blaze in the air-course, at B; but as the supply of water was quickly exhausted, efforts in that direction had to be abandoned. Owing to the pitch of the seam, which is shown by the profile in the lower portion of the figure, the fire was spreading rapidly.

FLAMES REACH SURFACE, SHOOTING HIGH IN AIR

It was soon evident that more drastic efforts must be made to quench the flame or the mine would be lost. Work was then started in an effort to seal off the entire area; but this also proved ineffectual and, in fifteen hours after the fire was first discovered, the flames had reached the surface, at the mouth of the manway and the air shaft, shooting upward from 20 to 30 ft. in height and destroying the fan in a brief period of time.

The mouth of the main slope was now tightly sealed; but, by making certain changes, it was possible to circulate sufficient air to continue the work of building solid brick stoppings outside of the wood brattices separating the other manway from the main slope.

When the "fire area," marked by a dotted line in the figure, had been thoroughly sealed off, in this manner, the work was commenced of building wood brattices in all entries in that portion of the mine from which the circulation had been cut off and which is marked as the "dead-air zone" in the figure.

The work of sealing off the fire was completed about Feb. 27, or fourteen days after its first discovery. In the meantime, preparations had been going on to enable the manufacture of carbon dioxide. For that purpose two old boiler shells, 42 in. by 28 ft., had been secured and erected near the mouth of the slope. These were connected with a 10-in. pipe line passing through the seals. Also, a tramtrack had been built leading to an unloading platform at the railroad siding.

CONTINUOUS SUPPLY OF CARBON DIOXIDE

The purpose of these arrangements was to furnish a continuous supply of crushed limestone and sulphuric acid to be used for the production of carbon dioxide in the boiler shells previously mentioned. These shells or tanks were to be used alternately so that the operation would be continuous. While the gas was being generated in one tank, the other was being cleaned out and a fresh charge of limestone introduced in readiness for the acid, which was supplied to the tank when the other became exhausted.

In order to ascertain the progress of the work, an 8-in. pipe had been placed in the seal, at the air shaft, and pyrometric observations and samples of gas for analyses were taken daily. This was continued until the samples contained 20 per cent of carbon dioxide.

VOLUME OF CARBON DIOXIDE PRODUCED

Estimating on a production of 3.4 cu.ft. of gas, per pound of limestone consumed, the engineers figured that approximately 200,000 cu.ft. of the gas had been forced into the mine. After careful consideration, about three months later, it was decided to reopen the mine. Every accessible portion of the workings was then examined and the fire found to be completely extinguished.

The work of recovering the mine was then started and operations were again resumed and continued, until 1919 when the place was finally abandoned. It should be stated, however, that the coal in the fire area proved defective and the brick stoppings built to shut off that section of the mine were never broken or disturbed.

Birmingham, Ala.

ROBERT HAMILTON.

Drawing Mine Timbers

Blasting destroys timber and wastes dynamite—Practical method of knocking out timbers when chain post puller is not available.

LOOKING over the issue of *Coal Age* for July 5, my eye rested on the inquiry of a Tennessee mine foreman, page 20, who asked for the most practical way of withdrawing mine timbers. He explains that he has used different methods of pulling timber but seems to lay particular emphasis on the practice of blasting out timbers that cannot be removed with safety by other means.

He states that a small stick of dynamite is inserted in a hole drilled in the post, about 10 in. below the roof. While acknowledging that the practice destroys the timber and makes it unfit for future use, he says that they have had comparatively few accidents, though the method has not been altogether satisfactory.

Being a neighbor of mine in Tennessee, I feel interested in saying a word on the subject. As a practical mine foreman, my friend will allow that the first consideration is the safety of the men employed in the work. No doubt he chooses the most practical and experienced men for the purpose. Allowing all this,

let me suggest that there will be greater safety and economy in putting his dynamite aside for other use thereby saving both timber and explosive.

While I fully agree with the editor who advocates the use of the chain post puller when drawing timbers, I want to take this opportunity of mentioning another method that we have found most practicable and that can be used with safety when the chain puller is not available, which is frequently the case. In this method, nothing is required but a strong rope and a good 8-ft. timber to serve as a battering ram.

The plan is a simple one. The two ends of the rope are securely tied to convenient posts, allowing a certain sag in the rope. The 8-ft. timber which is to be used as a ram, is then hung from the center of the rope in such a position that it can be swung to and fro.

After making sure that he stands in a safe place, the man operating the ram swings it backward and forward, striking the timber he wishes to knock out with a sharp blow. By the use of this method, I have knocked out posts and double timbers as well, with the greatest degree of safety. Where there is danger of the post being covered by the fall of roof and lost, it may be possible to attach a rope to the post, which can then generally be drawn clear of the fall.

Let me add in closing that the first thing to be considered, in the operation of a mine, is the safety of the men employed in the work. Next to this comes the cost of getting out the coal. Every reasonable effort must be made to reduce the cost-sheet if the mine is to be operated successfully and on a paying basis.

Inquiries Of General Interest

Leaky Joints in Air and Water Pipe Lines

Trouble from Leaky Joints Quickly Overcome
by New Method—Saving Effected in Cost
of Maintenance — Advantages of System

AT OUR mines, which are equipped with compressed air for operating the drills, we have experienced a considerable loss of power from leaky joints in the pipe lines, which are carried a distance of 6,000 ft. before reaching the point where the power is distributed to different portions of the working face.

For a time, the matter was not given the attention that it should have received, owing to the fact that the leakage of the air from the pipe line greatly improved the ventilation on the main road, which was the return airway for the mine and badly in need of better ventilation.

However, with the development of the mine and the installation of more drills, the demand for power increased and investigation showed the need of repairing the leaky joints, putting in new gaskets and lining up the pipe by supporting it where it had sagged. This work has made a considerable item in our cost-sheet and opened our eyes to the need of using more effective measures of maintaining airtight joints in the pipe lines. Somewhere we have seen or heard of a new method of making these joints airtight in long pipe lines. Any information that *Coal Age* or its readers can give that will assist us in overcoming our present difficulties will be greatly appreciated.

—, Ill.

MANAGER.

Many readers will recognize that this correspondent has voiced a common difficulty encountered in attempting to transmit power by compressed air through a long pipe line. Unless given careful and constant attention, leaky joints are bound to develop and a corresponding loss of power is invariably the result.

Speaking of leaky joints, however, the trouble is not confined to airpipe lines. The same difficulty is experi-

enced in maintaining tight joints, in an extensive spraying system, where the pipes are extended long distances underground. The trouble is much increased in a long siphoning system, where leaky joints greatly impair the efficiency of the siphon, which eventually will run dry, because of the leakage of air into the pipe line. Leaky joints also give much trouble in column pipes when supported in deep shafts where the pipe is subject to vibration due to hoisting and other severe conditions.

A new method of securing practically airtight and watertight joints in pipe lines has been extensively introduced in English collieries and is claimed to give good satisfaction. In one instance that has come to our knowledge, from six to eight men were kept constantly employed repairing leaky joints, in a large mine equipped with compressed air where ten miles of pipe had been installed, the pipes ranging from 2 in. to 10 in. in diameter. The application of the so-called "VICTAULIC" system to these pipes made it difficult to find a single leaky joint.

The device is exceedingly simple. As shown in the accompanying figure, it consists of two metal housings

DETAILS OF WATER- AND AIR-TIGHT JOINT
VICTAULIC SYSTEM

that can be bolted together around the joint and are made to inclose a leakproof ring which is flexible. The entire makeup consists of but five parts. The flexible ring seals the joint in the same manner as a U washer.

As the pipes do not butt together and as moreover there is clearance on each side of the shoulder the pipe line has ample room to expand. In consequence where these joints are used no other provision need be made for expansion. The flexibility of the joint is an exceedingly interesting feature in mining work, where rigidity in a pipe system is so frequently objectionable in striving

to make an installation conform to the irregularities of the mine passageways.

The fitting of a single joint, in the Victaulic system requires no skilled labor and is accomplished in about two minutes. The joint is sealed automatically and requires no further adjustment. Ordinarily, the metal housings are made of semi-steel (25 per cent steel) and are suitable for a working pressure of 300 lb. per sq.in., in a water pipe line, or 100 lb. per sq.in., in an air pipe line. With joints of forged steel, the working pressure can be increased to 600 lb. per sq.in. The seal of the flexible rim is more effective, the higher the pressure.

This system of securing and maintaining leaktight joints, in water and air pipe lines, is the result of special investigation and experiment by the Victaulic Co., Ltd., London, England. It should have a wide field of application in mines and quarries in this country.

Examination Questions Answered

Anthracite Foremen's Examination, Districts 8-14, Incl., 1923

(Selected Questions)

QUESTION—*What are the principal causes of fires in coal mines and what precautions should be taken to guard against them?*

ANSWER—Among the chief causes of mine fires may be mentioned: The careless use of open lights, in presence of gas or in proximity to combustible matter; in the handling of powder; in the preparation of shots in blasting; or in the handling of hay for the mules; also, the care of oily waste used about the pumps and other mining machinery. A mine fire may result from the ignition of gas by a defective safety lamp or by the improper use of such a lamp; or the ignition of gas or dust may be caused by the flame of a blownout shot. A feeder of gas ignited by a blast may be left burning in the coal and start a fire that is difficult to extinguish. Fire also frequently results from the spontaneous combustion of fine coal and dust stored in the gob, or the same may occur in a pile of oily waste carelessly thrown aside. Fires are also caused by the imperfect installation of electric wires, the sparking of motors in the presence of gas or dust and the blowing out of a fuse or the short-circuiting of live wires.

To avoid these results and dangers, strict rules must be made and enforced in regard to the handling of all explosive and combustible material, the use of open lights and other conditions liable to cause a fire. All safety lamps used in the mine should be carefully examined at the close of each shift and the same cleaned, filled and assembled for use again, by a competent person in charge of the lamphouse. All installations of electric wires and machinery of that type should be made by a competent electrician familiar with mining conditions.

QUESTION—*A sinking bucket is 4 ft. 6 in. deep, 3 ft. 3 in. in diameter at the top and 2 ft. 9 in. at the bottom; what is the cubical contents of the bucket and what weight of water will it hold?*

ANSWER—The shape of the bucket represents the frustum of a cone whose two diameters are $D = 3.25$ ft.; and $d = 2.75$ ft., respectively. The height of the frustum, or depth of the bucket, is $h = 4.5$ ft. The volume of the frustum of a cone is calculated by the formula

$$0.7854 h \frac{D^3 - d^3}{3(D - d)}$$

In substituting the given values in this formula, we have $3.25^3 = 34.328$; and $2.75^3 = 20.797$, making the difference of the cubes 13.53, while the difference of the two diameters is $3.25 - 2.75 = 0.5$ ft. and giving for the cubic contents of this bucket,

$$\frac{0.7854 \times 4.5 \times 13.53}{3 \times 0.5} = 31.88 \text{ cu.ft.}$$

Calling the weight of a cubic foot of water 62.5 lb., the weight of water in this bucket when full would be $62.5 \times 31.88 = 1,992.5$ lb., or practically one ton.

QUESTION—*What first-aid service would you render a person suffering from: (a) Compound fracture of limb; (b) electric shock; (c) powder burns; (d) fractured rib?*

ANSWER—(a) The first-aider, on finding a compound fracture of a limb, must send at once for a physician, at the same time adjusting the limb in the easiest possible position, with great care, to avoid the splintered bone from lacerating the flesh. In this position he must bind it carefully in a manner to prevent any undue movement causing further injury. If practicable, the injured person should be removed on a stretcher to where he will get better air and revived with smelling salts or other means, to prevent collapse.

(b) If the man is still in contact with a live wire, promptly shut off the current if a near-by switch is available; or short-circuit it by any means at hand; or cut the wire by a single blow of an ax; or drag the person from the wire by catching hold of his dry garments, or by the use of a pole, or otherwise. Always avoid standing on wet ground or handling wet garments when striving to remove the man from contact with the wire. When this has been done, apply artificial respiration after the usual manner.

(c) Everything must be done to exclude the air from the parts burned, by applying a thin paste of flour, starch or baking soda; or by the use of vaseline, olive oil, cream or fresh lard. Then cover the parts with a light cloth and remove the person to where he can be more comfortably treated.

(d) The breaking of a rib causes a sharp pain, by reason of the action of breathing creating a movement in the chest whereby the broken bones are made to pierce the flesh. In order to reduce this trouble to a minimum, a large towel, a garment, or any suitable bandage, must be wrapped around the body and over the chest in a manner that will afford some support to the broken parts of the rib and prevent their movement as far as that is possible. The injured person must be moved very carefully and given every care and attention while awaiting the arrival of the doctor.

QUESTION—*If you were sinking a double-track slope, on a dip of 40 deg., how would you secure the track?*

ANSWER—The track must be held in position and prevented from slipping down the slope by spiking it to crossbars hitched into the rib on either side of the road, at intervals of ten or twelve feet. At times, use is made of short struts or braces made to bear against the crossbars and set in footholes cut in the rib, the struts making an angle of about 45 deg.

International First-Aid and Rescue Meet More Complex Than College Track Meet

Running off an International First-Aid and Mine-Rescue Meet such as was held in Salt Lake City, Utah, Aug. 27-29, is no easy task for either the Bureau of Mines officials who are in charge of the meet annually, or for the 54 first-aid and 21 mine-rescue teams from all over the country who participated last month. It is a far more complicated and serious business than the great college track meets which drag throngs to the country's athletic fields. In the first place more contestants are entered than usually take part

FIRST MEXICAN TEAM TO TAKE PART IN AN INTERNATIONAL MEET

Third prize in the mine-rescue contest was taken by the team representing Real Del Monte y Pachuca Co., of Pachuca, Mex., captained by Manuel Ramirez.

in any athletic meet short of the Olympic games—about 450 were at Salt Lake City—and each event is judged on scores of points from start to finish instead of merely on the ultimate outcome. A report of the meet appeared in last week's *Coal Age*.

The first-aid contest, which kept judges, the 54 teams and a good many spectators busy in Bonneville Pavilion for two days and which was won by the Anaconda Copper Co.'s team, began with an inspection of equipment with which mine teams are trained to treat sufferers of any mine accident. Each team was composed of six men, including a captain.

Each team as it performed a problem was rated by a subcommittee of three judges. Subcommittees of judges worked under a committee of three chief judges, one of whom acted as chairman. Subcommittees of judges performed their work progressively. Each judge kept and signed his own score card.

CUP PRESENTED BY THE BERTHA-CONSUMERS CO. TO WINNER OF FIRST-AID CONTEST

Each of the several judging subcommittees consisted of two doctors skilled in first-aid training and conversant with the Bureau of Mines first-aid standards, and one layman familiar with underground mining methods and trained in the Bureau of Mines first-aid standards. Each team performed the same three problems.

Each of the several judging subcommittees consisted of two doctors skilled in first-aid training and conversant with the Bureau of Mines first-aid standards, and one layman familiar with underground mining methods and trained in the Bureau of Mines first-aid standards. Each team performed the same three problems.

HIGHEST HONORS OF THE INTERNATIONAL FIRST-AID AND MINE-RESCUE MEET WENT TO THESE ILLINOIS MEN

They won not only first prize in mine-rescue work but also the combination first prize with honors for rolling up a rating of 94 in both first aid and mine rescue. They are, left to right, top row: Captain Mungo Marshall, James Weir, John Young, William Larson and Mungo Brown; front row, J. B. Kell and Robert Tait. These men represented the Benton district of the Illinois coal field.

Such problems as these were worked on the floor of the pavilion over one of the team members, by each team:

(1) Treat following injuries: Simple fracture of lower jaw; compound fracture of middle of right thigh, bleeding freely bright red blood from wound over fracture on the front and to the inner side of the thigh; patient conscious, in state of shock.

(2) Treat following injuries: Severe injury to left eye-ball; broken kneecap of right leg; dislocated right shoulder; little finger torn off left hand, bleeding profusely.

(3) Man is found, apparently not breathing, on his back with shoulder and upper part of both arms in contact with a live electric wire. Demonstrate three methods of rescue before treatment. Treat. No burns to treat. Demonstrate artificial respiration for two minutes. Treat for shock.

There were many pitfalls awaiting each mine-rescue team

SECOND HIGHEST HONORS OF THE INTERNATIONAL FIRST AID AND MINE RESCUE MEET WAS WON BY THIS MONTANA COPPER MINING TEAM

First prize in first-aid work with a score of 97.91½ and a prize for being the best first-aid team from the Rocky Mountain states were the honors taken by this team representing the Anaconda Copper Mining Co. of Great Falls, Mont. The men are, left to right, top row: Captain L. J. Deranleau, Viggo Paulsen, Gordon Gillis, George Roberts and Dr. C. C. Gerrard; front row, Joseph Marcure and Edward Egan.

MINE-RESCUE TEAM ENTERING SMOKE AND GAS GALLERY AS IT BEGAN WORKING OUT ITS PROBLEM IN MINE RESCUE

Slack Time Raises Mining Cost

Bituminous Mines Average 220 Days per Year—Steadiness of Operation and Car Supply Chief Price-Determining Factors

The effect of slack times on the cost of running bituminous-coal mines is the subject of a report issued Sept. 12, 1923, by the U. S. Coal Commission. The report is in two parts; that given herewith in full is the conclusion as signed by the commissioners; the appendix is a staff report that will be published in full in *Coal Age* at a later date.

The summary follows:

TO THE PRESIDENT AND THE CONGRESS OF THE UNITED STATES:

As one of the results of its engineering study of the "cost of production" of coal, the U. S. Coal Commission submits its conclusions on the Effect of Irregular Operation on the Unit Cost of Production of Bituminous Coal. A more general discussion of irregular production in its broader aspects will follow in another chapter of this report.

The cost of producing a ton of coal, other things being equal, varies with the steadiness at which the mine is operated. If the mine runs every working day the cost is the lowest; each idle day adds to the cost of producing coal on the days worked. This is so because a part of the costs go on whether the mine operates or stands idle. Since irregular operation of bituminous coal mines is the rule rather than the exception, it is important to determine the cost of idle days.

It is the general practice to maintain soft-coal mines in condition as respects equipment, development and labor to produce coal on short notice. Mines are seldom completely closed for short periods and the labor force dismissed. Even in periods when the demand for coal is slack and orders few, it is customary for the management to maintain a working force, in part to keep the mine in condition to produce and in part because some of the force are paid by the month. Still other expenses, as will be detailed later, are continuous whether the mine is producing coal or not. Therefore, the sum total of the continuing expenses for a period of a year, for instance, must be prorated over the number of tons produced in that year. Obviously, if the mine produces twice as much coal in one year as in another, each ton of coal produced in the slack year must carry twice as large a proportion of the continuing expenses as are assessed against each ton produced in the year of high production.

Taking the month of 25 working days as full-time operation, it is found that when the mine works 16 days, 4 days per week, the cost per ton is increased 8 or 9 per cent over full-time operation; when working time is 12 days per month or 3 days per week, that is, half time, the unit cost

as it took the field. As each team went through its preliminary examination by the judges there were discounts totaling 100 points which could be assessed against the entrants. Failure to name or demonstrate tests for tightness and proper working condition of apparatus, improper assembly of apparatus, failure properly to explain the circulation of air through the apparatus, failure to discuss satisfactorily several main questions about crew performance and failure to explain properly the purpose of various parts of the apparatus were costly.

The whole meet was under the direction of D. J. Parker, for the Bureau of Mines, Mr. Parker is chief engineer of the Bureau's mine-safety service at Pittsburgh, Pa., with these Bureau men serving with him on the Bureau of Mines committee: J. J. Bourquin, E. H. Denny, Dr. A. L. Murray, Thomas Varley, B. O. Pickard, C. A. Herbert, W. D. Ryan, B. W. Dyer, D. Harrington and E. B. Swanson, W. Mont Ferry was chairman of the executive committee for the meet and Dr. A. L. Murray was secretary. Dr. G. H. Richardson of the American Red Cross, San Francisco, Cal., and H. M. Wolfen, superintendent of safety for the California State Industrial Commission, were chief judges of the first-aid contest. W. G. Duncan was chief mine-rescue judge.

is 21 to 25 per cent over full time or minimum cost; and when but 8 days per month or 2 days per week, is worked, costs increase 48 per cent. Four days per month, or 1 day per week, of operation raises costs 104 to 120 per cent over the minimum. If but one day is worked per month, the increase is from 474 to 549 per cent over full-time operating costs. These figures are based on the detailed reports of costs of production made to the Federal Trade Commission for 1918 and to the Coal Commission for 1921.

The following table gives the increase in cost of production for each day the mine is idle, expressed as percentages over the cost when the mine is worked 25 days per month:

Days Worked	Percentage of Full Time	Percentage Increase in Cost Production		
		1918	1918	1921
		266 Mines	117 Mines	119 Mines
25	100	0	0	0
24	96	1	1	1
23	92	2	2	2
22	88	3	3	3
21	84	4	4	4
20	80	5	5	5
19	76	7	8	6
18	72	8	9	8
17	68	10	10	9
16	64	12	12	11
15	60	14	15	13
14	56	17	18	16
13	52	19	21	18
12	48	23	25	21
11	44	27	29	25
10	40	31	34	30
9	36	37	40	35
8	32	45	48	42
7	28	54	58	51
6	24	67	72	63
5	20	84	90	79
4	16	111	120	104
3	12	155	167	145
2	8	243	263	227
1	4	507	549	474

The advantage and economy of full-time operation are clearly indicated. As between two similar mines, each having a cost of production of, say, \$2.50 per ton if worked 25 days per month, the mine that enjoys the best working time under conditions of car shortage and a strong market for coal, will make the larger profits because of lower costs; or under conditions of poor market one may undersell the other and realize a profit because with more days worked the cost will be lower. A mine having assigned cars or served by private cars in 1920, when car supply was relatively poor but prices uniformly high, worked every day with an average cost of, say, \$2.50 per ton. Another mine depending on its share of system cars may have worked but three days per week, in which event the cost per ton would have been 25 per cent higher, or \$3.12 per ton. If car shortage held operation down to two days per week, the costs would have risen 48 per cent to \$3.70 per ton.

It is during periods of car shortage, when demand for coal is at its best and prices high, that the effect of broken time on cost is most evident. In such periods the operator holds his full complement of labor and maintains his prop-

erty in condition for maximum output, in fact endeavors to increase his daily capacity because he thereby becomes entitled to a larger share of the available railroad cars. Under such conditions there is no possibility of economizing on costs as by lay-offs from payroll on idle days. The full effect of forced idleness is felt on costs under such conditions.

However, when demand is slack, railroad cars plentiful but orders for coal scarce, prices are low and labor is competing for jobs. Advantage can then be taken to reduce costs by curtailing indirect labor costs and in other ways. The cost of idle time can be and is thus somewhat reduced under slack market conditions. The comparative costs in 1918 of 27 companies operating 117 mines with the costs in 1921 of 25 of the same companies then with 119 mines gives the difference of idle-day costs due to car shortage as compared with idle-day costs due to no market. Taking again a base cost of \$2.50 per ton for full-time (25 days) operation it is found that when working 20 days (5 days per week) there was no difference; when working 16 days (4 days per week) the difference was negligible, 2½c. a ton; when working 12 days (3 days per week) the difference was 10c. per ton; and when working 8 days (2 days per week) the difference was 15c. per ton. One day per week brought the difference up to 40c. per ton. There is thus no notable difference in unit cost of production caused by short-time operation whether this broken time be due to lack of transportation or lack of market. The real difference enters in the reduction in the base cost, which can and quite generally is reduced in times of inactive demand.

It may be inquired in view of this factor of cost of idle time what effect on the country's coal bill the fact may have had that in the past 20 years the soft-coal mines have worked an average of but 220 days, or about 72 per cent of full time. If the price paid by the consumer were cost of production or a direct function of cost, then the answer would be that the total cost to the country was about 8 per cent more than it would have been if few mines working full time had produced this coal. However, the price in

periods of dull demand is set by the mines with lowest costs, which, other things being equal, are the mines that secure enough business, largely by reason of their lower cost, to operate the nearest to full time. Then other higher cost mines work less days, take less profits, none at all, or lose money. In times of poor demand and keen competition for business the consumer quite generally get the advantage in lower production costs that attends full time operation of the mines. During prolonged periods of inactivity many mines are closed down and those that are operated on short time quite generally lose money.

In periods of active demand, increases in cost due to broken operating time caused by car shortage are absorbed by operators in the higher prices realized for their output, providing it is sold in the open market. Operators with contracts at fixed prices are affected in the opposite way. Better operating time obtained by taking on low-priced business in dull periods serves to lower costs; in active periods when car shortage prevents full-time operation, costs at these mines are adversely affected with no opportunity to make up the difference by increasing the sales price.

A more complete presentation of this study, which represents the work of C. E. Leshner and R. A. Walter, of the engineering staff of the commission, is appended, together with a diagram illustrating the effects described above. It is hardly necessary to point out that the ratio of increase in cost as days worked decreases, accurate as it may be as an average for a large number of operations studied, cannot be expected to exactly fit any one mine. However, in the appendix general principles are set forth by which the ratio of increase for a single operation may be calculated from a few observations.

EDWARD EYRE HUNT,
Secretary.
F. G. TRYON,
Statistical Adviser.

JOHN HAYS HAMMOND, Chairman,
THOMAS R. MARSHALL,
CLARK HOWELL,
GEORGE OTIS SMITH,
EDWARD T. DEVINE,
CHARLES P. NEILL.

Cost of production is at the minimum when the mine is worked full time, that is 25 days per month and has no idle days. The stippled bar at the left represents a dollar of cost under such conditions.

The loss of one day's operation increases the average cost one cent on each dollar of cost, or 1 per cent; the loss of two days in the month increases the cost 2 per cent, as is indicated by the solid black additions to the stippled bar representing each dollar of cost.

Thus, if the mine loses 8 days out of 25 in the month, the average cost of production is increased 10 per cent, that is ten cents on each dollar of cost. If the mine is a "low cost operation," with a full-time cost of say \$2.00 per ton, when it is idle 8 days the average cost amounts to \$2.20. If a "High cost" mine, with an average of \$3.50 per ton when working every day, the average cost per ton in a month when 8 days were lost would be \$3.85 per ton or 10 per cent greater.

When the time lost exceeds one third of the month that is from 9 days upwards, the increase in average cost rapidly increases. If the mine is worked 12 days and loses 13 days, costs are increased 25 per cent.

If 17 days are idle, the cost is nearly 50 per cent over the minimum.

If but one day a week or four in the month is worked, the cost is more than doubled. Two days of operation per month raises the average cost per ton 263 per cent and each dollar of minimum cost becomes \$3.63. If but one day is worked the cost increases by the amount of 549 per cent.

Effect of Irregular Operation of Bituminous Coal Mines on Cost of Production

Searchlight May Be Turned on Retailer Soon, Warns Byron R. Newton

That the United Mine Workers will advocate nationalization of the coal mines as soon as the report of the U. S. Coal Commission is out of the way, was asserted by Franklin Bache, of Philadelphia, mining engineer and a coal operator in Arkansas and Oklahoma, in an address at the annual convention of the New York State Coal Merchants' Association, at Sacandaga. The convention was held Sept. 10, 11 and 12. Mr. Bache told the coal merchants that for tactical purposes government control of the coal business and government ownership of the mines has not been pushed recently, but that it is the basic demand of the miners' union and that its advocacy will soon break forth again.

He assumed that the coal dealers agreed with him that the extension of the government's activities in business is highly undesirable, and told them that "if we do not speak for ourselves we will have more and more government in business." "No sane man believes for one moment that government control and government ownership will stop at the coal business," he continued.

Mr. Bache denied that coal mines are a "natural monopoly." A fair-minded and well-informed public cannot properly place the chief blame for higher prices on the operators, he declared, for since 1914 the day wage scale in bituminous mines has been advanced from less than \$3 for eight hours' work to \$7.50.

"With such an advance in labor, there can be no question even in the most prejudiced mind as to the responsibility for the largest part of the increase in the price of coal, and when we consider that the public only knows about the price of coal to be delivered at the point of consumption and that freight rates have about doubled, we can show that our hands are clean as regards the prices now paid for coal," he declared. "There is no combination of operators to restrict production or to maintain prices," Mr. Bache continued. "There is no monopoly in ownership, but only a monopoly of labor maintained by criminal violence."

Byron R. Newton, former Assistant Secretary of the Treasury, who addressed the convention on the first day, characterized the settlement of the anthracite miners' controversy as "a patchwork which will cost the public about \$35,000,000, of which Pennsylvania is the chief beneficiary." "The public will pay from 75c. to \$1 more on each ton of coal," Mr. Newton said. "The cure rests with the public in urging the closest co-operation between operators and public." He said that this is a critical time in the anthracite industry, as the oil, gas and electric industries are on the trail of the coal man. Saying that the mine operators occupy the front in every contest waged with the labor union, Mr. Newton declared that he was sure the public quite generally is inclined to support the operators in the splendid fight they have made, "particularly in this last campaign," and in what they tried to accomplish.

"Everything they have stood out for has been something for the protection of the public and the men," he said, "and with persistent stubbornness the union leaders have opposed the operators at every step." Mr. Newton told the dealers that as the operator has had the searchlight turned on him for so long the public knows all about him, it will now be turned on the retail dealer.

Mr. Newton said the facts and ethics of the situation all point to the necessity for co-operation between producers and distributors in educating the public.

Samuel B. Crowell, president of the National Retail Coal Merchants' Association, told of the work accomplished by the officers and committees of the national organization. Service is what the retailer has to sell, Mr. Crowell continued—knowledge of when and how to get the best coal, how best to prepare the coal at the yard; how to make the best delivery; how to obtain and keep a sufficient number of satisfied help and of the proper and broad way to handle labor problems. He told the dealers they would not go wrong if they forgot what prices competitors paid

for coal, and made the price for their own coal that which will enable them to give service in its fullest sense.

Charles B. Staats, of Albany, was re-elected president of the association for the ensuing year. Other officers chosen are: Vice-presidents, C. A. L. Wood, Rochester; R. J. Wulff, Brooklyn; John Murray, Waverly; Treasurer, J. M. Gaffers, Schenectady; Secretary, F. A. Eldredge, Auburn.

Pinchot Makes Public Text of Coolidge Message' on Strike Settlement

Governor Pinchot of Pennsylvania made public Sept. 13 the message of congratulation from President Coolidge upon the settlement of the anthracite controversy. The Governor also issued a statement explaining that the telegram was given out upon receipt of word from the President's secretary, C. Bascom Slemp, that Mr. Coolidge expected Mr. Pinchot to make it public.

President Coolidge's message was dated at the White House Sept. 7, the day before the anthracite operators' representatives and miners' union officials, in conference at Harrisburg, agreed finally upon the terms of settlement. The message said:

"Please accept my heartiest congratulations on the settlement of the coal controversy. It was a very difficult situation in which I invited your co-operation. Your management of it is a distinct public service. I cannot commend it too highly. Certainly there ought to be some method devised for a settlement of disputes of this kind in accordance with principles of justice and fairness to all parties concerned. The constantly recurring danger of lack of an adequate fuel supply is of itself a grave criticism of a great industry and an intolerable condition for the public to endure."

Although the message was received six days previously, Mr. Pinchot had declined to make it public until assured from the White House that there was no objection to its issuance at Harrisburg. The Governor's statement said:

"Having received word today from Mr. Slemp that the President expected me to make public his telegram of congratulations I do so with pleasure. At the same time I wish to express again my appreciation of the President's heartiest and welcome message."

Another paragraph was added by the White House Sept. 14 to the exchange of compliments between President Coolidge and Governor Pinchot over the anthracite settlement when this telegram from the Governor, responding to Mr. Coolidge's message of congratulation on the outcome of the Harrisburg conference, was given out:

"Please receive my heartiest thanks for your courteous and welcome congratulations on the settlement of the coal controversy."

Coal-Mining Men Drawn to Exposition of Iron and Steel Electrical Engineers

The exposition of the Association of Iron and Steel Electrical Engineers which will be held in the Broadway Auditorium at Buffalo, N. Y., Sept. 24 to 28, will hold much interest for coal men. This association numbers among its members many coal-mining electrical engineers and a large part of the program will be devoted to coal-mining electrical engineering problems.

Over one million dollars worth of apparatus will be on display, representing what developments by 150 manufacturers for the coal and steel industries.

The technical sessions to be held in conjunction with the exposition have all been prepared with a view to imparting the practical experiences and data obtained by engineers in the field of operation.

Items of special interest to the coal-mining engineers will be "Specifications Covering Automatic Engine Stops," "A System of Coal and Ore Bridge Traverse Control," "The Liquid Slip Regulator or Rheostat," "Economical Use of Fuel in the Steel Plants," "The Tempering of Coal," "High-Pressure Steam Boilers."

Coal Commission Submits Recommendations to Eliminate Strikes in Bituminous-Coal Mining

Report Is Neutral on Check-Off—Advises Operators to Organize and Adopt Labor Policy—Deprecates Coercive Correctives—Takes Middle Ground on District Autonomy—Opposes Nationalization and Compulsory Arbitration

The U. S. Coal Commission has issued a sequel to its report on "civil liberties," published in full in *Coal Age* last week. This report is on labor relations in the bituminous-coal industry and is understood to represent the last word of the Commission on strikes and labor questions. A detailed voluminous report, on which the following sequel is based, also has been issued. The report of the Commission, dated Sept. 14, 1923, follows:

TO THE PRESIDENT AND THE CONGRESS
OF THE UNITED STATES:

The public is not satisfied with the service it receives from the coal industry. The U. S. Coal Commission finds no reason to believe that a dependable supply of coal at a reasonable price is inconsistent with reasonable conditions of life and citizenship for the miners, or with a reasonable return on judicious investments. This chapter on the Labor Relations in Bituminous-Coal Mining is presented with the hope on the part of the members of the Commission that the suggestions it contains may help to point the way to better relations and to such service to the public that resort to public ownership may be unnecessary.

SUMMARY OF RECOMMENDATIONS

(1) We recommend that each side place some check upon provocative and truculent publicity which tends to undermine good relations.

(2) We recommend that the operators and the union undertake both separately and jointly the study of means of meeting the fundamental problem of unemployment through the stabilization of the industry, as a service to their own interests and as an evidence to the public of serious intention on their part to meet their own problems in a statesmanlike way under private administration.

(3) We recommend that the Congress provide for the continuing co-operative study of and action against the problem of unemployment as one of its first responsibilities. This would involve studies and activities in the fields of labor relations, technical aspects of production, and the marketing and storage of the product.

(4) We suggest the great importance in labor relations of good operating management in the mine, so that adequate production service to the men at the face will always be afforded.

(5) We recommend the establishment in each district and nationally of joint commissions of operators and miners, with the aid of competent men, to make thorough studies of the principal jobs and of the existing rate differentials. It is important to develop an adequate basis for the needed revision of the rate structure, at present marked by many inequalities between sections, between mines, and between jobs in the same mine.

(6) We recommend continuing co-operative study of the same subject by the general government.

(7) We recommend further attention to this same subject by individual mine managements and local unions.

(8) We recommend continuous, compulsory collection and publicity of rates and rate changes in the non-union fields by the general government.

(9) We recommend the universal establishment in the non-union fields of check-weighmen selected and paid by the men as a means of insuring confidence in weights.

(10) We recommend that that form of wage payment known as "subcontracting" be discontinued. It is held by most of the coal industry and by nearly all other industries out of date and inherently subject to abuse.

(11) It is recommended that the leasing of convict labor

to operators, such as is now the practice in Alabama and a few other non-union areas, be condemned as demoralizing to the industry and degrading to the convict.

(12) It is recommended that the practice of discounting "scrip" be made illegal.

(13) We recommend serious study by both sides, jointly and separately, of the problem of undue limitation of output and of the causes which lead to it.

(14) We recommend that each agreement in the union fields contain provision that disputed cases of discharge shall be settled promptly through conciliation or arbitration.

(15) We recommend to non-union operators that adequate checks, to insure against capriciousness and unreasonableness, be placed on the exercise of the right to discharge.

(16) We condemn violence, thuggery and gun work, violation of the law and disturbance of the peace, whether practiced by the union to enforce complete unionization, or by the operators to prevent it.

(17) We recommend that such destructive labor policies as the use of spies, the use of deputy sheriffs as paid company guards, house leases which prevent free access and exit, and individual contracts which are not free-will contracts, be abolished.

(18) We recommend the recognition of the right by the union to encourage non-union workers to join the union by the example of service to its members in the union field, by showing where the advances in the union field have helped the non-union workers and by peaceful and honest persuasion of every sort.

MAY PERSUADE MAINTENANCE OF NON-UNION BASIS

(19) We recommend the recognition of the similar right of the non-union operator, by good works and honest persuasion without force, to maintain a non-union status.

(20) We recognize the irritating effects of the check-off to the operator, especially in the collection of special fines and assessments. And we recognize its injurious effects upon the union in divorcing the problem of income from the winning of membership, and in the resulting lack of closeness of contact and of educational service and control by the higher officers to the lower officers, and to the rank and file members of the union. We believe that the unsettling effects of casting out this practice, however, might more than overbalance the gains. It may well be that the use of the check-off for the collection of fines and special assessments (except in the case of fines for violation of the agreement) should be discontinued. But we do not feel that the check-off is vital enough ever to justify a suspension of operations, whether the union is seeking to extend its use or the operators seeking to throw it out.

(21) We recognize that the establishment of a policy of complete district autonomy in the negotiation of new agreements, as advocated by some operators, would result in great turmoil and a renewal of the fierce competition between districts that must inevitably lower standards. We suggest, however, that many operators in the outlying fields have a real grievance when they say that essential elements of their agreements are made for them in conferences in which they are not represented. We suggest that the two parties should work out a system of national negotiation with district agreements, which will avoid standard-cutting wars between districts and secure adequate flexibility to meet necessary district conditions.

(22) We recommend a continuing umpire in each district as indispensable to the growth of good relations, since

such an agency tends toward the establishment of orderly processes of law in the industry, facilitates the necessary bargaining that goes on from day to day, is an educational force for both operators and union, and is a foundation for progress upon which the industry can build with confidence.

(23) We call attention to the fact that the operators are not so effectively organized for labor relations as the miners and that, both as a defensive and as a co-operative measure, there should be effective district and national organization and a national labor policy among union operators. Such an organization should bring to the surface the large amount of sound and constructive thinking that is being done among operators concerning the labor problems in the union fields; it should strengthen and stimulate the work of the various labor commissioners. It should create the office of national labor commissioner to function as do the labor commissioners in the districts, but on national problems. In this connection attention is called to the great importance, during the process of negotiating a new agreement, of having negotiators of the right type—men who know the union and the industry, who know when to be aggressive and when not to be, masters of sound strategy and wise tactics and, finally, men whose straightforwardness the union trusts.

(24) We find that one of the most constructive steps that has been taken collectively by the bituminous operators has been the almost universal establishment of the office of "Labor Commissioner." Only the highest grade men can adequately discharge the functions and get the full possibilities out of this office.

(25) We recommend much more serious concentration upon the problems growing out of the psychology of men at work, especially noting the examples of the many companies who have established good relations.

RECOMMENDS TRAINING IN MANAGEMENT

(26) Specifically, we recommend more attention to the training of superintendents, foremen and assistant foremen in problems of management, especially in dealing with labor under a union agreement. These men are closest to the miners and actually handle the grievances that arise; they, therefore, in large degree determine the bases on which the more general problems of labor adjustment rest.

(27) Half information on topics of mutual concern ranks high among the factors that tend to mar relations. We therefore recommend a policy of publicity of facts—both within the individual mine and nationally—which would include accounting reports by operators as recommended in the Commission's anthracite report and similar reports concerning union finances.

(28) In accordance with best policy in the coal and in all other industries, we recommend the policy in each company of centralized responsibility for labor relations.

(29) We recommend much closer contact and greater educational service from the district and national officers of the union to the local officers and men.

(30) We believe that the union will need to depend more on *facts* and less on *force* if it is, in the future, to advance the interests of its members as successfully as it has in the past. We therefore suggest the importance within the union of continuous facilities for research which will collect and interpret facts and aid and enlighten union policy.

(31) We particularly regret that the union has given so little serious consideration to the ways of meeting the fundamental problem of the coal industry—the problem of irregularity of production and employment—which concerns its members more deeply than any other problem observed, and on which they keenly desire that something be done. A definite effort to devise a joint system of unemployment compensation or insurance which shall offer considerable incentive toward steadiness of operation, as well as relief during payless days, will be of vital interest to the citizens of the industry.

(32) We believe that the union is facing a critical transition period. It has gone through and won the struggle to become powerful. The challenge confronting it now is whether it can use great power in a responsible way to serve social ends.

(33) We do not advocate nationalization as a means of meeting the national strike or other parts of the problem of labor relations.

(34) We recommend against compulsory arbitration as a means of preventing a national strike, because we do not believe in discretion-made law in either the industrial or political fields, and because there is no way to enforce a compulsory award which does not involve enforced operation or enforced labor.

(35) We believe that incorporation of the union would not have the effect of binding the union to its contracts, and making it responsible, often predicted for it. Contracts can now be made if both parties wish, with effective binding power, but ordinarily neither side desires that wage contracts shall be specific enough to be legally binding through judicial enforcement. The flexibility of various state incorporation laws makes it unlikely that incorporated unions would differ practically from unincorporated. Finally the Coronado case not only decides that a union is a legal entity for the purpose of responsibility for torts but also holds that a union voting a strike renders itself responsible for acts growing out of the strike just as a corporation would be responsible for the acts of its officers and that the union funds can be reached directly through a suit for damages, just as the property of a corporation can be.

URGES GOVERNMENT INVESTIGATION OF BASIC FACTS

(36) We recommend continuous investigation and publicity by the federal government of the basic facts upon which industrial relations depend. Such continuous investigation should not be principally critical, in the sense of being chiefly concerned with noting cases of bad practice, but rather with making known cases of the opposite sort. This should bring about such a continuous interchange of information as to stimulate a greater sense of public responsibility and better practices by the union and the operators.

(37) We recommend special compulsory investigation when the prospect of failure to renew an agreement is imminent, so that the public may have a chance to be heard before conflicts arise. Specifically, we recommend an inquiry under the authority of the President of the United States. To this end, it is suggested that all agreements should contain a clause that will provide for automatic renewal of all agreements except in regard to provisions concerning which either party may have given notice to the other ninety days in advance of the date of termination of the agreement. In case of failure to agree, a report, setting forth the factors at issue, should be made to the President, by each side, not later than sixty days before the expiration of the agreement. It is recommended that when such a report is made, the President immediately inquire into the factors at issue and secure a report and award thereon made on or before the date of expiration of the agreement. The award would or would not be made public as the President would deem wise in the particular circumstances. It should be the purpose of such a report to focus upon the negotiators the irresistible moral pressure implicit in their joint obligation to furnish the public with coal.

We are confident that with a continuous orderly process of investigation and report, and if advisable with the timely injection of a definite representative of the public into the situation in case of disagreement, it will become very much more difficult for either side to adhere in any captious way to a contention that will precipitate a tie-up of the industry.

In case a suspension occurs because of failure to reach an agreement before the expiration of an existing contract, there should be no question of the continuance of maintenance men at their occupations. Both in the interest of the industry and in that of the public every contract should provide for this contingency.

The best approach to a remedy for the evils of the general strike will not, in our judgment, be found in an immediate resort to drastic prohibitory measures. Whatever artificial gap may have developed between employer and employee, they must work together or there can be no peace and no real efficiency. The weight of opinion among operators and union officials alike is that they themselves desire to fix the fundamental terms upon which the industry shall

operate. The most thoughtful and best advised among them express great confidence of their ability to do this in an orderly way. From our survey of the statesmanship that exists in the industry, it is believed that the operators and the union are equal to this task, if once they recognize the finality of the public insistence on continuous operation and address themselves single-mindedly to bring that object to pass. It will be necessary, however, for them to find means of bringing their best statesmanship to the front in connection with the general negotiations. They cannot perform this indispensable public duty unless they emancipate themselves from the atmosphere of militancy that to often characterizes their proceedings.

It is believed that the combination of continuous investigation and publicity, with the possible resort to mediation at the instance of the President of the United States, may remove the necessity for more drastic emergency measures. The process here outlined should have a sobering influence that will make strongly for enforcing responsibility to the public among representatives of both the operators and the miners. Until measures for holding both sides to their responsibilities have been exhausted, it will be extremely unwise for the public to embark on coercive measures of regulation of labor relations.

While it is believed that the above suggestions will en-

courage mutual accommodation and agreement at the time of the renewal of negotiations and will therefore lessen the chances of national strikes or suspensions, the fundamentally constructive opportunity lies in the building up of the day-to-day relations within the agreement period. Improvement in industrial relations during the life of the agreement would very considerably lessen the probability of a national strike.

The full text on the subject of labor Relations in the Bituminous Industry is presented in another chapter which follows.

Dennison, who were associated with Dr. Willits as an advisory committee; to John Carmody, to Dr. Boris Emmett, to H. S. Gilbertson, to J. S. Keir, to Dr. W. M. Leiserson, to S. B. Mathewson, to R. L. Melendy, to O. L. Preble, to Dr. B. M. Squires, and to Delos Walker, who made most of the filed investigation for the study and helped in the preparation of this report; and to Dr. Helen Wright, who has been of great aid in assembling the material.

Check-Off Evils Need Correction

**Fiercely Debated Practice, Says Commission,
Likely to Survive in Bituminous Field—
Fears Its Elimination Might Be Unsettling**

The full discussion of labor relations in the bituminous coal industry, of which the summary by the U. S. Coal Commission is published in full on the preceding pages, contains approximately 60,000 words and if printed in full would occupy 40 pages of *Coal Age*. The document containing this discussion covers every phase of labor relations in the union and non-union bituminous-coal fields.

The discussion on the check-off is published here in full because that question is one of the most important on which the Commission has passed judgment. The Commission's recommendation with respect to the check-off is No. 20 on the preceding page, and the following is the evidence on which the recommendation was based:

"One of the most fiercely debated topics brought before the Commission is the so-called 'check-off.' The issue is likely to become confused in the public mind by the acrimony of the discussion and by the too frequent use of epithet in place of argument. The 'check-off' is an arrangement under which the operator agrees to deduct from the wages of each miner, who signs a written authorization, the amounts that may be due from month to month from such miner to the union for regular dues, special assessments or fines that may be levied against him by the union. The aggregate amounts thus deducted from the individual miners are then paid over by the operator to the treasurer of the local union. The operator thus acts as the collecting agency for the union so far as those of his employees are concerned who have signed and turned over to the union a written authorization for the operator to make such deduction from the amounts due them from pay day to pay day. The practice has never existed in the anthracite field but it was one of the demands that the miners made upon the anthracite operators when the negotiations for a new agreement in 1923 began; and it was the refusal to concede this demand that caused the first rupture between the miners and the anthracite operators in July.

"The check-off is not synonymous with the closed shop. The agreement and practice could exist in a mine run as an open shop. In such a mine the dues, etc., could be deducted in the case of union members who had signed authorization while no such deductions were being made in the case of non-union miners. On the other hand a closed shop could exist by agreement but the union collect its own dues from its individual members instead of having these amounts deducted by the employer. The check-off, therefore, bears

no essential or necessary relation to either the open or the closed shop.

"In support of the demand made on the anthracite operators for the check-off, the representatives of the miners cited as a precedent certain practices that have always been prevalent in the anthracite field. Practically all of the operators in that field supply their miners with the explosives, fuses, oil, caps, and other supplies used by the miner in his work. The miner is supposed to furnish these for his use in his work, and where these are furnished from the supply department of the mine they are charged to the miner and the total of his indebtedness for such supplies is deducted on each pay day from the amount due by the operator to the miner. This is a simple bookkeeping transaction.

Each day the miner's account is charged with any supplies furnished him by the company and is credited with the amounts due him for the coal mined or the work done by him. At each pay day each miner's account is balanced and he is paid the amount by which his earnings exceed his indebtedness to the company. In addition to deductions for supplies those companies that have company houses deduct the rent from the miner's earnings before paying him; similarly, the amount due for coal furnished the miner by the company is deducted. But these all represent merely a balancing of the amounts due by the miner to the company against the amounts due by the company to the miner. But in many instances other items are deducted that fall into a different category. It is not uncommon for a store at which a miner desires credit to require him to sign an order on the mining company directing it to deduct from his earnings each pay day the amount that may be due by him to this store for his purchases.

USES TO WHICH CHECK-OFF HAS BEEN PUT

"In past times deductions were sometimes made in this way for church dues, for liberty bond purchase by installments, and for numerous other purposes. These practices have been lessening but some of them still prevail. There is obviously a clear distinction between a case in which an operator merely balances an account and deducts from what he owes the miner the amounts that the miner may owe him and one in which an operator undertakes the request of the miner to withhold from the balance due the miner an amount that the miner may owe a third party.

"The first case, where the operator merely balances his own books and pays the miner the difference between the debits and the credits on his account, is not at all a parallel to the operator collecting the union dues. But the principle involved when the operator accepts authorization from the miner to withhold from his pay an amount due the grocer, or the bank or the church, is precisely the same as that

involved in the request from the union to have the operator agree to withhold from the earnings of each miner who so directs the amounts that may be due by the miner to his union for dues, etc.

"There are already two instances of a check-off for the union which were imposed on the anthracite operators by the award of the Commission in 1903. Where coal is paid for by weight a regular weighman is employed by the operator. One of the demands in 1902 that was granted by the award of the Commission was that at any colliery where the coal was paid for by weight the miners should have the right to select a check weighman whose salary was to be paid by them. The award further provided that when requested by the majority of the miners the wages fixed by the miners for their check weighman was to be deducted proportionately by the operators from the earnings of the individual miners.

"The same provisions apply to the check docking boss, an official selected by the miners to represent them at the docking station and whose salary is fixed and paid by the miners but deducted by the operator from the earnings of the individual miners. A similar practice was directed by the Commission in the case of miner's laborers. In the anthracite field most miners have as an assistant a laborer who is in the employ of the miner and not of the company. He is hired by the miner, paid by the miner and disciplined or dismissed by the miner. But the award of the Commission provided that before each pay day the miner should turn in to the company a statement of the amount due by him to his laborer and that the company should withhold such amount from the earnings of the miner and pay it directly to the laborer.

"These cases are on a parity with the proposed arrangement for the check-off, since they represent the operator collecting from his employees and paying the amounts deducted from wages over to a third party. While, therefore, it is apparent that the check-off in itself is merely a business arrangement and not essentially the insidious and diabolical thing that it is sometimes held to be, it is not a practice that should be forced on an operator against his will. It is the duty of a labor union, just as it is the duty of any other association, to collect the dues and assessments from its members by its own agents and not by coercing the employer to act as its collecting agency against his will.

"In defense of its efforts to secure the check-off in the anthracite field a representative of the miners pointed out the many difficulties that the local unions found in collecting direct from the individual members and contrasted this with the saving in both expense and effort resulting from having the operator deduct the dues from the pay checks of the miners. The advantage of the check-off to the union is very obvious but that is not a valid argument for its enforcement upon the operator. No doubt the churches, the fraternal organizations, the merchants, the landlords, and other groups could point out the difficulties and the losses they sustain through inability to collect all that is due them, and the unnecessary expense involved in collecting what they do get, as compared with the ease and economy if they could all turn over to the operator their accounts against the individual miners and have them deducted from earnings by the operator.

"Originally the check-off system was used only for dues, but it has gradually been extended to include fines and special assessments, the latter usually for strike funds. In their published statements the bituminous operators make particular complaint against the check-off. In private conversation many of them are inclined to accept the check-off as an established condition but to complain bitterly over its extension to assessments and fines. They strongly object to collecting funds with which they will be fought in case of strike or suspension. In this connection it is interesting to report a statement made by a prominent operator official to one of our investigators to the effect that he was present at the meeting in which union operators first made the suggestion that the check-off machinery be used in their territory by the union as a means of collecting funds for prosecuting strikes in non-union territory.

"What practice should obtain in respect to union membership under a collective bargaining agreement (to quote from

the anthracite report) is a debatable question, the answer to which should be arrived at by agreement or mutual accommodation between the parties. But any answer which relieves the union of responsibility for maintaining itself, and thus divorces the question of membership from the service rendered, is bound to be harmful to the union, not to mention the other interested parties.

"Unions, like other institutions, slip easily into arrogance and incapacity when existence is made too easy. Such a condition is sure sooner or later to make them a prey to attack both within and without. This opinion applies with equal force to the bituminous fields. So long as a bare alternative to non-membership in the union is anywhere open, the penalty may remain only faintly noticeable; but when the last steps in compulsory membership shall have been taken, and a 100-per cent monopoly of labor established with methods of automatic financing guaranteed, the union will have created a condition which will greatly intensify the possibilities of internal disloyalties and cliques. Many unions think it bad union policy to have a check-off.

"From this standpoint of its own permanent welfare, the union would seem to be showing a lack of wisdom in insisting on the universal application of the check-off. The check-off is bad for the whole situation and constitutes a steady source of irritation to employers, who are themselves forced to collect and deliver the whips with which they are to be scourged. This injury to a reasonable and proper pride will as surely result in retaliation as do similar injuries to the pride of the employees. On the other hand, it saves the union from the effort necessary to its own health of making close contact with its men; educating its membership and its local leaders; and educating itself through these contacts. This effort would be made necessary by a continuous member-calling campaign.

"The necessity of effort to maintain membership in an organization tends to keep the organization responsive to the sentiments of the rank and file; absence of such necessity tends to dull such responsiveness. It is not to be expected that this healthful effort will be spent where the necessity is not present. To the extent that an institution fails to exercise necessary functions it weakens its stamina, abdicates its sovereignty. We find indication in some territories even now that the operators come much nearer to owning the union than is wholesome from the standpoint both of union and public interest.

"Even though the check-off represents an abdication on the part of the union and is unsound from the standpoint of long-time union policy, it is not likely that it will be abandoned in the bituminous fields. In these fields it appears to be an established institution both in regard to dues and in regard to fines and assessments. The force of habit and established practice are such that the unsettling effect of changing the practice might well overbalance the benefits of a practice inherently more sound.

"The existence of the check-off makes it all the more necessary that the union take steps to correct the evils of the system and to overcome its weakening effects on the relation of the organization to its members. From the standpoint of effective administration and in the interests of wholesome relationships both with members and with operators, it would seem ultimately desirable to abolish the check-off for fines and assessments, but whether or not this occurs, there is certainly a crying need in many of the bituminous fields for a closer relationship and a greater service between the organization and its members. This question will be further discussed in the section on Union Administration."

Cement Shipments Increase

Production of portland cement during August, 1923, according to the Geological Survey, totaled 12,967,000 barrels, as compared with 12,620,000 barrels in the corresponding month of 1922, and 12,620,000 barrels in July, 1923. Shipments for the month were 14,971,000 barrels as compared with 14,361,000 barrels in August, 1922 and 13,712,000 barrels in July, 1923. Stocks at the end of August amounted to 6,077,000 barrels, as compared with 5,746,000 in August, 1922, and 8,081,000 barrels in July of this year.

Railroads Urged to Distribute Coal Cars According to Commercial Instead of Capacity Ratings

Strikes and Transportation Cause Shortages and High Prices—Better Use of Railroads, Not Their Overdevelopment' Recommended—Savings by Short Haul Stressed—Find No Evidence of Soft Coal Combustion

The causes of irregular operation of the bituminous coal mines, coal shortages, car shortages, high prices and low prices, and transportation, are treated in a report of the U. S. Coal Commission on "Irregular Operations with Suggestions as to the Remedy for the Same," released for publication on Sept. 20.

The introduction and general recommendations are published in the following pages; the sections of this report treating in detail the questions of irregular operation, overdevelopment and transportation will be published later.

TO THE PRESIDENT AND THE CONGRESS OF THE UNITED STATES

Among the topics referred to the U. S. Coal Commission for investigation and report is "irregular production" with "suggestions as to the remedy for same." The importance of this matter, including as it does not only irregular mine operation and overdevelopment of the industry but also related problems in the transportation of coal and possible measures of relief, leads the Commission to devote this chapter of the report on the bituminous industry to the subject of Relief from Irregular Operation and Overdevelopment. This chapter treats of the engineering and economic phases of irregular operation, leaving to another chapter the interaction of labor relations and irregular operation of the mines.

CAUSES OF SHORTAGES

Widespread strikes and lack of railroad transportation to carry the peakload in times of extreme demand are the two factors that alone are responsible for the serious shortages of bituminous coal in this country that have several times occurred since 1915.

There have been but two national strikes of the union coal miners, that of November and December, 1919, cutting off some 70 per cent of the soft-coal output; and that of the summer of 1922, affecting the bituminous-coal fields to the same extent and shutting down the anthracite fields completely for about five months. The loss of production occasioned by these concerted withdrawals of the organized mine workers has in each instance caused such general shortage of coal that even after resumption of mining there were long periods of insistent demand and high prices. The strike of the mine workers is the only bar to the continuous production of bituminous coal at a rate considerably in excess of any present possibility of consumption by the industries, railroads and households of this country, and of demand for export.

The bituminous-coal industry rests upon abundant, unmined reserves. The capacity in mines and mining labor is sufficient to produce at least 25 per cent more than the highest rate attained in periods of peak demand, and if demand were spread evenly over the year, the overdevelopment would be even more pronounced. The facilities of the railroads necessary to carry the coal from mines to consumers have not been sufficient in the past eight years to transport as much coal per week as at times the consumers of the country wanted and as the mines were able to dig and load into railroad cars.

The causes of strikes and the possibility of their prevention have been discussed in another chapter of this report. The effect of strikes on the orderly, economic production, transportation and distribution of coal are here considered. Local strikes increase the irregularity of operation and the cost of production, though with the surplus capacity they do not cause shortage of coal. Those affecting larger areas, as fields, such as were fairly common prior to the war in the organized fields, likewise have not resulted in shortage

or marked price inflation, again because of the excess capacity of other, adjacent fields that were in position to supply the market thus vacated.

These field strikes, notably those in the Central Competitive Field, were potent factors in forcing the overdevelopment of the soft-coal fields, both union and non-union. The two national strikes had that effect in marked degree on the non-union fields.

The bituminous-coal industry is highly competitive. It is likely that were there never any limitation on production imposed by lack of transportation, there would be little or no overdevelopment because prices would never rise above the competitive level that obtains in periods of full car supply. Such a cure for the overdevelopment of the soft-coal industry and for high prices for coal would simply transfer to the railroad industry the overdevelopment and necessarily increase freight rates. It is estimated that it would cost the railroads two billion dollars to build their facilities up to the point where they could carry the peak loads of coal. This would represent an average carrying charge alone with interest at 6 per cent, of 40c. a ton, on commercial shipments of bituminous coal. Such a solution of the problems of the coal industry could be considered only if none other were possible.

The alternative is better use of the transportation facilities currently available. This means simply the more uniform movement of coal throughout the year. Since the fall of 1922 the railroads have furnished transportation for a production of between 10,000,000 tons and 11,000,000 tons of bituminous coal per week; that is, from 500,000,000 to 550,000,000 tons per year, which apparently at this time is sufficient for the country's requirements and exports. This has not been accomplished without special effort. The railroads must be expected to expand their coal-carrying facilities in step with the expected increase in the nation's coal requirements, but they, in return, should not be permitted to dissipate their efforts in needlessly long hauls of coal.

Operating to hinder the uniform purchase and movement of bituminous coal are the seasonal character of consumption and the fluctuations in consumption attending changes in industrial conditions. The variation in use of household coal represents the extreme in seasonal requirements; the industrial expansion in 1915 is an example of rapidly expanding market due to improvement in business. A further factor, not so important as it was before 1917, is the national habit of buying soft coal as needed, instead of storage against future needs. Large scale strikes, either at mines or in railroads, of course, are positive bars to production.

The consumption of coal is an independent factor not to be changed, except as it is prevented through sheer inability to obtain supplies, by any economic or legislative proposals. It is obviously impracticable to legislate in the direction of forcing the uniform purchase and transportation of coal. The only remedy lies in furnishing an economic incentive to off-season purchase and the consequent storage at the point of consumption of bituminous coal, *at the proper seasons*. As has been stated, the alternative is overdevelopment of the railroads at an initial cost of \$2,000,000,000 and an increase in coal freight rates in which the item of 40c. a ton to meet added interest charges would be possibly the smaller part.

Industry is plainly able to forecast with considerable accuracy its purely seasonal fuel requirements, but not those variations attending marked business expansion and contraction. The increases in coal consumption of the winter of 1916, of 1920, even of 1922 were but dimly foreseen, as were the drop in 1919 and the notable slump of 1921. But

the concerted effort in this direction of equalized demand is the proper line of attack and the first steps are correcting those factors that have not only permitted but encouraged irregularity of demand and of production and providing for changes that will supply the economic incentive for the regular purchase and production of bituminous coal.

Irregularity of demand, the natural consequence of ordering coal only as it is required, buying in the fall and winter and not buying in the spring and summer, is the primary cause of present conditions. The habit bred and grew at a time when the development of the railroads was at least as advanced as that of the coal industry, if not more advanced. The practice presented no difficulties. That time has passed, but in the transition there has been no change in the method of business looking to changed conditions, only rules designed to prevent unfair discrimination.

The fact of irregular demand due to seasonal consumption alone offered incentive for development of soft-coal mines in excess of average requirements. If the country called for a maximum tonnage in November, there was a market in November at least for that maximum output, and mines were opened to meet that demand. A decade ago the cost of opening and developing a soft-coal mine was small, by every comparison with today. Coal land was cheap, little machinery was required and that less expensive. The railroads were anxious for the traffic. The periodic good market in fall and winter offered profits. Development, from keeping pace with the country's growth however, grew to overdevelopment as other factors were brought into play.

Among the more important of these factors contributing to overdevelopment prior to 1916, even beyond peak demand, were periodic regular strikes in the organized fields. The most important and regular were those in the Central

Competitive Field beginning April first every second year. These strikes came with such regularity that their effect was anticipated. Consumers, particularly the railroads, bought heavily in advance and stored coal to tide them over the strike. This meant a season of very active demand which encouraged development of new mines. In years when these strikes were of more than usual severity the non-union fields were called in to meet added demand for coal; thus their overdevelopment was promoted.

In this manner the irregularity of production caused by seasonal demand, sectional stoppages of production, and local transportation shortages brought on overdevelopment. To these causes are to be added the persistent seeking by railroads and by coal operators in the past 30 years for markets for the newly developing fields south of the Ohio River. In the early 90's the Pittsburgh field supplied 35 per cent of the total production of the Appalachian fields shipping to the Central West and Northwest, and the West Virginia fields shipped 15 per cent. Competition offered by the Southern fields has cut Pittsburgh to 25 per cent in the past 5 years and raised West Virginia to 32 per cent to the total.

Overdevelopment has its evil consequences on the industry itself. It is the cause of the average short working year for the capital invested and for the mine worker. Both have come to expect and to demand a full year's wage for little more than two-thirds of a year's work. This is the waste, that profits neither the mine owner nor worker, that the public is called on to pay for as the cost of overdevelopment. The soft-coal buyer actually does pay that part of it that is represented by the higher unit wage of the worker due to short-time employment. The consumer is only prevented from paying the full amount that capital would collect by the fact of active and sometimes ruinous competition.

Removal of Causes of Irregular Operation and Overdevelopment

The consequences of overdevelopment can be avoided only by removing so far as economically possible the causes that have produced it. Overdevelopment will then diminish to the economic minimum.

The causes and avoidance of strikes have been discussed in another chapter of this report. In the following pages are considered those causes related to production, transportation and distribution. The more important conclusions reached are briefly:

The system under which coal cars are distributed to coal mines in times of transportation shortage should be changed to give first consideration to the commercial ability of the producer to sell coal rather than to ability to produce and load it into railroad cars; and

Given substantial similarity in the grade and quality of coals available to a particular market, there is obvious economy in supplying that market with the coal nearest to it.

The first will furnish the economic incentive for regular off-season purchase and storage of bituminous coal by the consumer and by thus increasing the length of the average working year for the mine and miner, reduce costs of production and prices to the consumer. The second, by minimizing unnecessary and premature development will operate in the same direction and at the same time accomplish savings in the cost of transportation.

HISTORY OF OVERDEVELOPMENT

Prior to 1916 there were no nationwide car shortages, miners' strikes or price upheavals in soft coal. Then constant contention of the soft-coal operators was for markets. For years the wage levels and, therefore, costs in the organized fields had been stabilized and standardized. The non-union fields of the south were expanding faster than their older neighbors on the north because of easier mining conditions, lower wage scales, better working time and favorable freight rates.

The ease with which a soft-coal mine could be opened, the comparatively small capital required and the fact that coal is a staple commodity for which there is an obvious, though limited market, induced many to enter the field. There were additions to the list of producers every year, and eliminations. The turnover of companies was high.

Well organized and efficiently managed companies with coal reserves of good quality survived and grew—they survived the summers of low demand and grew in the winter, learning all the time the advantage to themselves of regular production and the cost of intermittency and seeking to even out their curves of production by building up regular trade connections and stabilizing their business. Poorly organized and poorly managed or weakly financed companies were unable to face the vicissitudes of the competitive conditions and were forced to the wall.

The influence of the union was at once to stabilize the industry and, through the biennial strike or suspension in the Central Competitive Field, to introduce the largest element of speculative profit and incentive for overdevelopment. The two-year wage contracts with the United Mine Workers in the decade before the war not only standardized wages but strikes as well. The fact that the expiration of these contracts was staggered for different union fields prevented any general cessation of mining if agreements were not promptly entered into. Thus though a prolonged disagreement in one field would shut off coal production for months, other union fields nearby speeded up and supplied the market. A strike of a year affecting half the State of Ohio in 1914 hardly caused a ripple in the market. The miners and operators alone suffered.

In this prewar period from 1900 to 1916 car shortage was locally severe enough at times, but it never assumed national proportions. The coal-originating ends of the railroads, the branch lines and feeders tapping the mine fields were developed in step with the mines. The delivering ends of the railroads, the interchange connections and terminals, were developed in step with the coal-consuming demands of industry. Storms or local rail congestion temporarily produced a car shortage, more notably and often in such highly developed centers as Pittsburgh, where are concentrated not only large coal producing but large coal consuming industries.

The buyers and consumers of bituminous coal had little cause for complaint throughout these years. There was no need to buy coal of poor quality for plenty of the best was available. The price was just about what the buyer was willing to pay. Many producers had no knowledge of any of the elements of the cost of production other than

the actual out-of-pocket expense of digging and loading the coal into railroad cars, and they sold it on the basis of that information.

The soft-coal business was profitable for those companies with good coal and good mines who sold service with their coal. Such companies had regular contract customers whose trade could be depended upon. The majority of soft-coal producers, however, in the prewar period fared indifferently, alternately taking profits and losses.

All the elements of economic maladjustment, all the conditions that confront the soft-coal consuming public and the producing industry, before this Commission for consideration, were present in some degree or form before the war. In one instance only had the help of the federal government been publicly sought by any party and that was by operators in the Middle West, who, beset by internal competition and forbidden by law to seek relief through collective action, turned to Washington for assistance in 1914.

There was overdevelopment, intermittent operation, good profits for some, receiverships for others, high earnings and low earnings, strikes, car shortage and occasional flurries in price and local stringencies in supply. None of these are new. The conditions imposed by the war intensified all these so-called ailments. What had been internal and local questions became national questions with all that implies in its political aspects. This country found itself with a coal problem.

SOFT-COAL SHORTAGES DESPITE RECORD OUTPUT

Production records were broken in 1916, in 1917 and again in 1918, yet the country was short of soft coal. The manufacturing industries stimulated by the war, before the country entered it and afterward, were large coal consumers. The country as a whole entered the winter of 1916-1917 with what might have been adequate stocks under normal conditions. These stocks were entirely inadequate, however, for the protection of the country going at the new high rate of speed. The demand for coal became a rush to get supplies not only for current consumption but for additions to stocks. For nearly two years—that is, from the fall of 1916 to late summer of 1918—the production of soft coal was but sufficient to meet current needs. By September, 1918, the situation was by way of being tranquilized by the gains in storage coal in the hands of consumers.

By the first of November, 1918, the enormous total of 63,000,000 tons of bituminous coal had been accumulated by consumers. The next year this stock pile was largely consumed. The strike of 1919 which shut off 70 per cent of the soft-coal production for 6 weeks and the "outlaw" switchmen's strike on the railroads in April and May, 1920, seriously reduced production and forced consumers to use up storage coal. The industrial boom of 1920 thus began with industrial and railroad stocks of coal at low ebb. Again the combined demand for coal for use and for building up storage piles was more than the railroads could handle, though the mines were able and anxious to produce. Prices for bituminous coal rose to unprecedented heights, to fall only when the demand had been satisfied because consumers' reserves had been built up to approximately safe levels.

Again in 1922 consumers accumulated between 60,000,000 and 70,000,000 tons of soft coal in anticipation of a general strike. The strike lasted nearly 5 months and at the end stocks again were low. This time there was a more accurate, general knowledge of the situation, and the country was informed currently as to the status of production and stocks and advised to proceed slowly in accumulation of winter reserves. The result was an orderly distribution of coal and with a few local exceptions a comparatively small increase in the mine price. The huge deficit in anthracite production as a result of the simultaneous strike in that field, some 40,000,000 net tons, in so far as it was overcome, was made up by soft coal without putting an undue burden on the bituminous coal industry.

The price of bituminous coal at the mines in the summer of 1923 dropped back to competitive levels. Transportation has been comparatively open and an average of between 10,000,000 and 11,000,000 tons per week has been produced without stress or strain or inflation of mine prices.

SHORTAGES AND HIGH PRICES

The shortages of soft coal and price inflations of previous years were of small consequence compared with those of 1917, 1920, and even the fall of 1922. It is to a study of the most recent history that the Commission has directed its attention. Correction of conditions that make possible such high-price orgies as that of 1920 is what the country desires.

The immediate cause of high and exorbitant prices of soft coal is a demand from buyers far in excess of the supply. There is no evidence of any combination or monopoly among producers and shippers of bituminous coal, now or at any time, to control production or influence prices. In fact the mines are so numerous, the control so diversified and the competition so keen that such a combination, even to influence the price, is inherently impossible.

It has been the history of the past 10 years that the combination of low consumers stocks and rapid expansion in demand almost inevitably results in a sellers' market in which prices soar. Stocks of soft coal, which are almost exclusively in the hands of consumers and not of producers and shippers, reached a low point in the summer of 1916 and again in 1919, the cause in each instance being the natural reaction from active buying and building up of reserves immediately before. In the first quarter of 1916 consumers were active in acquiring storage coal against an anticipated strike in the Central Competitive Field on April 1. There was no strike but the consumers used up their reserves instead of ordering from the mines and production lagged. After the Armistice on Nov. 11, 1918, the consumers of soft coal devoted themselves to the consumption of the large reserves accumulated prior to that date and let the mines lie idle more than half the time until mid-year 1919. In both these years 1916 and 1919 the average holding of reserve coal over the country declined nearly to two week's supply.

Such soft coal as was accumulated between July and Nov. 1, 1919, when the national strike of union miners in the bituminous-coal region began, was used while that strike endured. Again, the gain in storage during the winter was dissipated by the curtailment in production caused by the railroad switchmen's strike early in 1920. Thus the coal buyers' panics of both 1917 and 1920 were ushered in by low stockpiles.

The initiation of active buying of coal, as of any other commodity, tends to elevate prices. The sharp activity that characterized the coal market in the fall of 1916 and throughout 1917 was the immediate result of consumers' anxiety for coal. Stocks were low, business was booming and more coal was required to manufacture and transport the products of industry. Without coal nothing could be made to fill the orders and the industrial began to bid for coal. He set the price.

EFFECT OF CAR SHORTAGES ON PRODUCTION

The price went up under these circumstances because the consumer could not get coal as fast as he wanted it. This inability was not due to lack of soft coal in the ground, of mines, or of miners, but to lack of transportation. The railroads were and are equipped to carry a normal tonnage of coal from the mines to market. Nearly 90 per cent of the soft coal produced requires transportation to markets away from the mines, and 97 per cent of the transportation is by railroad. Transportation, therefore, may limit production. When it does, there is said to be a "car shortage," though the deficiency is often as much in locomotives as in cars and the trouble often is due to congestion in railroad yards and terminals.

When coal mines get orders for coal they order cars in which to ship the coal. When there are not sufficient cars supplied to fill these orders the buyer cannot get all the coal he has ordered or contracted for. The car shortage results in a coal shortage. Distribution and the ordinary course of trade is disorganized. The rising price of coal furnishes the incentive for the opening of new mines and the reopening of old ones. Whereas there had been less than 300 new mines opened per year in the 6 years prior to 1916, there were 454 new soft-coal mines in 1916, 1,285 in 1917, 1,573 in 1918 and 1,058 in 1919. Each of the going

mines sought to enlarge its capacity. Coal buyers placed orders wherever they could, often duplicating, sending agents out and giving employment to a host of new coal jobbers and brokers.

There are just so many railroad cars each day to be given to the coal mines. When the orders for cars exceed the number available, the supply is prorated among the mines, the idea being to give each mine the same number of hours work per day or per week. As more mines demand cars, the railroads being bound by law to parcel the supply without discrimination, the older mines are given less. A mine able to produce 10 cars per day, when there is 80 per cent car supply gets 8 cars; with 50 per cent car supply, gets 5 cars. The only way to get more cars is to increase mine capacity and thereby become entitled to a larger proportion. The result of this method was that when every operator made this endeavor none could profit much thereby. There was a scramble for men to increase daily capacity. The new mines had the advantage in part because of easier work and in part because they paid wage bonuses. The old established companies lost ground.

In Indiana County, Pennsylvania, for instance, there are 5 large, old-established producers. This group employed 5,270 men in 1914 and produced 3,800,000 tons of coal. By 1916 the number of men they had declined to 4,126 and by 1918 they had 4,095 men and their production had increased to 4,200,000 tons. Meanwhile, all other producers in this county with 7,496 men in 1914, added to their force and had 8,094 men in 1917 and 8,747 men in 1918. Their production rose from 5,600,000 tons in 1914 to 8,500,000 tons in 1918. In Somerset County, Pennsylvania, the same thing took place. The two largest producers had 4,189 men in 1914, in 1918 but 2,651. Their production in 1914 was 3,700,000 tons and fell to 2,600,000 tons in 1918. All other producers, many small, had 7,580 men in 1914, and 8,363 in 1918. Their production increased from 6,500,000 in 1914 to 7,700,000 in 1918. This is typical of what was happening all over the soft-coal fields.

Many of the new mines were small and inefficient, many were wagon mines. Their costs were higher, but that mattered not, for they had no contracts at low prices and the spot market took their product at almost any price. These new mines took cars and labor from the older mines, and by so doing increased the difficulties of the railroad and disrupted labor relations.

Normally between two-thirds and three-fourths of bituminous coal is sold on contracts, for the most part covering a year, usually from April 1 to April 1. Prior to 1917 shippers had little difficulty in fulfilling their contracts, as the only interference was from an occasional brief car shortage. The major strikes that affected large areas were discounted in advance and no contracts made over their duration. However, the car shortage that began late in 1916 was severe enough to cut down the output of individual mines and thus reduce shipments on contract. Shippers were uncertain of what tonnage they could get out and consumers what coal they were going to receive on their contracts. Receipts of contract coal were also reduced because some shippers, lured by the higher prices in the spot market, failed to ship coal in accordance with their agreements. The net result was a wild scramble for free coal—that is coal not under contract. Later in 1917 the government fixed prices, but it was not until April, 1918, that the distribution mess was cleaned up.

ASSIGNED AND PRIVATE CARS

Out of all this confusion there emerged the assigned car, railroad and privately owned, and the consumer owned mine. Since with recurring car shortages there was no assurance of getting full delivery on contract coal, and at such times the open market price on free coal was high, that the railroads resorted to a device known as the assigned car to get their fuel. Since getting coal in such periods of shortage is nothing more or less than getting cars, the railroads would make agreements with mine operators to give a specified mine a full quota of cars in which to load railroad fuel. Such a mine, of course, worked all day every day. It attracted the best labor in the field, it had the lowest cost because of full-time operation. The railroad cars given to mines for loading railroad fuel on

the assigned-car basis were taken from the available supply before distribution was made to other mines shipping commercial coal.

Coal cars had for years been owned by a few soft-coal producers. Shipping their own coal in their own cars was a part of the service these few companies gave their customers. For a few the advantages even times of car surplus were sufficient to warrant the heavy investment. The advantage became great in times of car shortage, for the producer with a sufficient supply of his own cars was independent of the railroad supply and could operate his mines more nearly to full time. He was able to furnish coal to his customers when others could not. This fact made the producer with his own cars the most desirable source of supply.

Coal of suitable quality is the most important raw material of railroads, public utilities and of certain industries, as iron and steel. The first step of this important class of users toward stabilizing their fuel supply was the purchase or development of coal mines. Thus at least proper quality and freedom from high market prices were assured. The number and capacity of consumer-owned mines has increased notably in the past 6 years. In 1920 the production from these mines represented some 25 per cent of the total output of soft coal. The movement toward ownership of coal mines by consumers has been a factor of no small importance in adding to the overdevelopment of this industry, since the tendency has been to open virgin coal rather than to acquire old mines.

But owning the coal mines it not in itself assurance of a fuel supply. The consumers' plants are distant from the mines and the coal must be hauled over the railroads. When transportation is abundant the consumer can obtain coal to his liking without difficulty and at reasonable price, and at such time his ownership of a mine may be of doubtful advantage. If the consumer requires 1,000 tons of coal per week and develops his mine to produce that quantity, he will find his supply reduced in times of car shortage to whatever percentage of car supply the railroad may allot the mines. To get 1,000 tons per week he may find it expedient to increase the capacity of his mine to 2,000 tons per week, so that if car supply falls to 50 per cent, he may still get his 1,000 tons of coal. Mine capacity is overdeveloped on this account.

To overcome this difficulty some consumers likewise have their own coal cars. Under the rules that have obtained in the past, but which the Interstate Commerce Commission changed in its decision of June, 1923, on assigned and private coal cars, these private cars could be given to the mines in any quantity, regardless of how meager the supply of railroad-owned or "system" cars might be. The consumer owning coal cars, with or without his own mine, under the rules in effect until now, has been in a favorable position to get coal at any rate he desired, regardless of "car shortage." A number of railroads not reaching the coal fields have bought coal cars to send to mines on other roads exactly as public utilities or industrials have done.

The private coal car has been a good investment in the past 6 years, because of the extended periods of "car shortage." On the other hand the growth of the practice of assigning cars, both railroad for fuel coal, and private, has worked to the disadvantage of producers and consumers not in position to avail themselves of this form of favored car supply. Large public utilities, for instance, have taken the position that the character of the service they rendered the public is as essential as that of the railroads, and that they should be allowed to have "assigned cars" from the railroad supply, to protect shipments of coal to them purchased under contract.

The inequalities introduced by the assigned car are illustrated by the figures for the Pennsylvania R.R. in Pennsylvania. In 10 months of 1920 the commercial mines—that is, those depending on their distributive share of railroad cars—received 50 cars for every 100 they ordered. The mines getting assigned cars, of course, received a full supply. If all cars had been evenly distributed each mine would have had 69 cars of each 100 ordered. That is, the commercial coal mines lost 19 out of every hundred cars ordered that assigned car mines might have full time. In September, 1922, one-fourth of the coal cars on this road

were assigned; in January and February of 1923 two-thirds of the cars were assigned. In February commercial operators were receiving 18 cars out of every 100 ordered.

The Interstate Commerce Commission decided in June, 1923, that the practice of assigned cars, railroad or private, is unfair and has ordered it discontinued.

Doing away with assigned cars will not appreciably increase the total transportation the railroads can offer the soft-coal industry. Having no assigned cars will not ease the problem of those consumers that must have large, regular supplies of coal. Unfair as it has been found to be, the assigned car was an effective prop on which a growing number of consumers were coming to lean. The reason of course, was the protection of supply coupled with assurance of lower price. There should be a substitute method meeting these requirements, but without the objection of the assigned car practice.

COMMERCIAL RATINGS RECOMMENDED

The Commission recommends that in the future in determining the rating of a mine for the purpose of car distribution, consideration should be given to the commercial ability of the mine to sell its production as well as to its physical capacity to produce.

In the years before the war certain of the important coal-loading railroads in this country at one time or another did give consideration to commercial ability as well as to physical capacity. In some instances both factors were given equal weight. In other instances one or the other factor was given a weight double that of the second. In the course of the development of coal-car distribution rules during the war and post-war periods, reliance upon commercial ability to sell and ship coal was discarded. This was perhaps a natural result of the fact that over a long period during these years there was a ready market for practically all the bituminous coal that could be produced and transported.

But in the future when in the face of the existing state of the industry it may be expected that there will come long periods when the market cannot by any means absorb the potential production, there is good reason for again considering commercial ability to sell as well as physical capacity to produce bituminous coal, in determining the rating of a mine for car distribution purposes. The Commission's recommendation is that in determination of such ratings in the future, the commercial factor should be given a controlling influence.

The Commission understands, of course, that the primary duty to determine a just and reasonable rating lies with the railroad which distributes the cars. But in our opinion, if the railroads for any reason are slow to adopt the method of rating here suggested, the principle is of sufficient concern to justify investigation of the entire subject by the Interstate Commerce Commission on its own motion to the end that just and reasonable and otherwise lawful methods of rating and distribution consonant therewith may ultimately be established.

Study convinces us that action along this line is necessary to effect relief to the industry and to the consuming public. Such a system of distribution would certainly:

Furnish incentive to the producer to operate during dull seasons, and thereby more evenly distribute the transportation load throughout the year.

Furnish incentive to the consumer to buy and receive coal above actual current requirements in dull seasons and thereby more evenly distribute the transportation load throughout the year.

Remove the incentive to secure preference in the use of transportation facilities at certain periods by the use of the assigned car, either railroad or private.

Mitigate the effects of coal car shortage by reducing car shortage in amount because leveling out demand and production, and taking the pressure off the spot market in times of car shortage by permitting continuous performance on contracts.

The practical effect of a system of distributing transportation based on ability to sell coal together with ability to produce would be:

To straighten the production curve, leveling off peaks and filling valleys not only of the industry as a whole, but of individual mines.

To reduce the opportunity for the sporadic opening of speculative mines.

To increase the opportunity for regular operation and thus reduce the cost of production, and on the average the cost of coal to the consumer without undermining the profits of those operators who elect steady business at moderate profits as against intermittent operation at speculative profits.

To reduce the existing overdevelopment of the industry and curtail unnecessary development.

To promote consolidations for the purpose of marketing; that is, the grouping of smaller producing units for selling purposes.

This would advance co-operative marketing, already under way for years in certain fields.

To increase the transportation and thereby the production of coal in times of severe car shortage by reducing at such times the number of mines to be served with cars.

To increase the average days per year the miner is given opportunity to work.

The proposed factor of commercial car rating should not be based on contracts between buyer and seller. The proposed ratings should be determined by quantity of coal shipped during the last protracted period of car surplus, whether the shipment were on long-time or short-term contract or spot sale. It is expected that it would be to the mutual advantage of buyer and seller to engage in at least 12-months contracts under such a system enabling the seller to move the coal in the low market season and the buyer to insure a supply guaranteed as to price and tonnage in times of car shortage and higher prices.

To administer such a system of car ratings would require that the railroads maintain no more records than they now have. A weekly or monthly summary of tons shipped from each mine, or by each group of mines operated by the same company in the same field would be the base for the commercial rating. For the capacity rating necessary to govern distribution of cars available over and above those required to fill commercial ratings, the records now maintained as the base for rating mines would be used.

The introduction of the commercial factor in rating mines is not open to objection on the score of discrimination. The producer, large or small, has equal opportunity to take advantage of the system. The private coal-car owner should be permitted to use those cars continuously throughout the year, but should have no advantage over the shipper in system cars if there were a shortage of transportation facilities other than of cars. The rules by which the commercial factor is applied should be designed so as not to encourage ill-advised competition through reductions in wage scales.

The change suggested in the system of rating mines may require some modification of the Transportation Act.

Coolidge Urges Study of Anthracite Prices By Federal Trade Commission

President Coolidge has suggested to the Federal Trade Commission, it was stated at the White House, Sept. 14, that this body devote some attention to wholesale and retail prices of anthracite coal following the resumption of operations in the hard-coal fields. The Coal Commission recently made public an amplified statement regarding pyramiding profits in hard coal in which it was shown that during the strike of 1922 some carloads of anthracite coal changed hands among wholesalers as many as four times, a marginal profit being added by each party to the transaction so that the ultimate margin ran as high in one instance as \$4.25 per ton.

Measures against excessive prices, it was pointed out at the White House, largely are matters of local administration of the law, but it was said that in so far as the federal law can reach this subject, the effort of the national administration would be exerted toward obtaining coal at a reasonable price to the consumer. This, it was said, probably best could be accomplished by the Federal Trade Commission, with the force of public opinion behind its findings.

Coal Retailers Assail Pinchot Settlement

In a statement presented to Chairman Hammond of the U. S. Coal Commission Sept. 12 by Roderick Stephens, chairman of the Governmental Relations Committee of the New York State Coal Association, the National Retail Coal Merchants Association declares that the Pinchot settlement of the anthracite strike is merely a victory for "arrogant organized labor"; that the Governor of Pennsylvania sought peace at any price, and that he completely ignored economic facts concerning the retail dealers. Arbitration was "relegated to the scrap heap," it says.

Proceeding, the statement says: "We are distinctly opposed to the proposal of Governor Pinchot that the cost of the arrangement he has proposed in settlement of the controversy between the anthracite operators and the United Mine Workers shall be borne by the retail coal trade. . . .

"Another anthracite crisis has been passed, and Governor Pinchot is modestly accepting the laurels being thrust upon him as the protector of the public interest. Like all settlements arrived at in a political atmosphere, it has been attained by the age-old practice of 'passing the buck.'"

Commission Report on "Pyramiding" Is One-Sided, Say Wholesalers

Characterizing the recent statement of the U. S. Coal Commission on pyramiding of profits on the part of the middlemen as "one-sided," the American Wholesale Coal Association on Sept. 17 made public a letter of protest, addressed to the Commission and signed by Charles L. Dering as president of the association.

The entire wholesale coal business of the country in 1921 was carried on at a net profit of only six-tenths of a cent per ton and the entire year's business of the central western division was handled at a net loss of 2c. per ton, the letter declares, while at no time since 1916 did the average margin of wholesalers of the country as a whole exceed 8 per cent of the cost of the coal to them. Attention is called to the agreement signed with Secretary Hoover in July, 1922, by which the total service charge of wholesale dealers should not exceed 8 per cent, it being contended in the letter that this agreement put the stamp of the government's approval on an 8-per cent margin.

The protest of the wholesalers is against the broadcasting by the Coal Commission of its find of 750 carloads of anthracite handled in New England last winter with heavy wholesalers' margins and its silence on other matters, which misled the public to a belief that all wholesalers take such profits and follow such practices.

Kansas Industrial Court Asks Ouster Suit Against Jackson Walker Co.

The Kansas Industrial Court wants to put the Jackson Walker Coal & Mining Co. of Kansas out of business. After investigation, the court finds that the company is restricting coal production from 9,000 acres in southeastern Kansas without permission, is depriving a good many miners of a chance to work and is about to force a group of sublessees into ruin. It has asked the State Attorney General to institute an ouster suit against the company.

The court's investigation showed that when the government ordered the Santa Fe R.R., years ago, to dispose of its coal mines in Kansas, the sale was to the Cherokee & Pittsburgh Coal & Mining Co., all of whose stock was owned by the Santa Fe except a few officers' qualifying shares. Then the land was leased by the Jackson Walker concern, which was financed by the former company. Jackson Walker, in turn, leased parts of the tract to other operators, who now have invested about a million dollars in improvements. With a contract to supply the Santa Fe all the Kansas coal the road needed, the Jackson Walker Co. took a contract royalty of 40c. a ton from all sublessees. Now that the railroad has turned to oil the sublessees say they cannot

sell coal on the open market unless the 40c. royalty is reduced. The Jackson Walker Co.'s refusal to reduce gives the Industrial Court its basis for the charges now set up.

S. P. A. Clough, president of the Jackson Walker company, testified it is the company's policy to conserve its coal supply until the relative positions of oil and coal as fuel make it more advantageous to use the coal.

J. A. McDermott, presiding judge of the court, in addition to signing the general findings, wrote an additional report in which he asserted that unless their contract is modified or some unexpected substantial improvement occurs in the coal industry, the sublessees face heavy financial loss and ultimate ruin. He calls the Jackson Walker course "piracy" and declares the elimination of the company from the operation of the subleased land would be beneficial.

Colonel Reveals "Plot" to Blame Herrin on Labor; Chamber of Commerce Denies It

Echoes of the Herrin massacre are heard periodically. The last one was set up when Colonel Sam Hunter, of the Illinois Governor's staff, declared to the Illinois Federation of Labor at a convention Sept. 11 that efforts were made by men of the Illinois Chamber of Commerce to get him to testify "to lies that would have obtained the indictment of Gompers, Lewis, Farrington, Walker and Olander" in connection with the massacre. Walker and Olander are labor leaders. Colonel Hunter did not divulge any details nor mention the names of men who approached him.

A prompt denial that the Illinois Chamber of Commerce had suggested any such thing to Colonel Hunter was forthcoming from John H. Camlin, president of the state chamber. Mr. Camlin publicly challenged Colonel Hunter to name a single man who had made such a proposal for the chamber. Colonel Hunter did not immediately reply.

The Colonel was at Herrin before and during the massacre of June 21, 1922, representing Governor Small, and declares he urged the Governor and Adjutant-General Carlos Black to send state troops when the trouble became serious. Both officials deny this. After the massacre, when county officials did nothing to apprehend or punish the murderers, the Illinois Chamber of Commerce was active in raising a fund to aid the state's futile prosecution of a long list of union miners. The union made a great play, at the time, upon the claim that the Chamber and "capital" were doing their best to break down unionism.

Coal-Freight-Rate Hearing On in Denver

With a large number of Western and Middle Western coal operators in attendance, Henry C. Hall, a member of the Interstate Commerce Commission, began its inquiry at Denver, Sept. 10, into coal freight rates between Colorado and New Mexico mines and points in Nebraska, Kansas, and Missouri. The complaint in the case was filed by the Colorado and New Mexico Coal Operators Association, and directed against the Denver & Rio Grand Western and other railroads. The operators charge discrimination against them in favor of Illinois, Wyoming and other coal-producing points.

Illinois Mine Workers Get Rid of Infamous Herrin Strip Mine

The United Mine Workers of Illinois are reported to have sold the infamous Lester strip mine at Herrin, Ill., scene of the Herrin massacre, to a new concern under the name of Mammoth Coal Co., of Benton, Ill. The union has issued no statement of the transaction. S. S. Shive, of Benton, formerly a salesman for the Jeffrey Manufacturing Co. and lately in the mine supply business, is president of the Mammoth Coal Co. D. C. Johns is mine manager. The union bought the mine early this summer for \$729,000, presumably to quiet damage claims of the owners against the union.

Commission Ends Work Sept 21; Correction of Coal Ills Still Up to the Industry Itself

This week marks the official end of the U. S. Coal Commission. It will be a long time before its work can be cataloged, read and understood. So far the public is thinking of it in terms of an anthracite-strike settlement, which it did not settle. The union miners have long since backed off and are openly hostile, charging the Commission with writing a brief for the West Virginia non-union operators. Congress is yet to be heard from.

The President has not indicated in detail what he will do with the report and recommendations of the Commission. Automatically the report will be presented to Congress when that body convenes. It was stated at the White House that speaking generally, the President expects to commend the report of the Coal Commission to Congress, but, contrary to the general newspaper reports, there has been no statement that the President will emphasize any particular phase of the Commission's report or that he feels it necessary to do so.

It is difficult to find any coal man who feels that the Commission has done anything constructive. There is no general condemnation of the Commission. Instead it is commonly said that Mr. Hammond and his colleagues did about all that any board could do; but that that isn't much. Nobody accuses the Commission of not being intelligent or honest. Instead the common refrain is: "They found out all there is to know—what every coal man knows is true—but it is beyond the power of any one group of mortals working one year to produce any cure for the troubles of this industry."

WALLOP BOGIE OF "COAL BARONISM"

Most observers agree that a service of some value has been rendered in the publishing of so much coal information to the people. That at least calls the attention of a few citizens to the fact that coal men are not robbers and criminals. The bogie of "coal baronism" is dealt a wallop. But the trouble is, as these men see it, too few people are ever going to wade through the Commission's reports to learn what is in them. Nobody could write such reports and broadcast them in such a way as to appeal to popular fancy. Therefore the possible good of the Commission's work is necessarily limited because the Commission produced nothing spectacular.

The only other thing that the coal fraternity can see as a result of the Commission's work is that the country may learn from it that there is no use expecting some federal commission to wave a wand and correct all the ills of the industry. Some other way must be found. That other way the Commission half points out. It is that the correction must be made by the industry itself and that the coal consumers of the land must do their part.

Two of the outstanding conclusions and recommendations which will appear in the final report of the Commission, as forecast in sectional reports made public by the Commission, will be provision for full publicity from operators and miners alike under government supervision, and that many of the most serious problems confronting coal mining may be worked out by the elements of the industry itself far better than would be the case were legislative bodies to attempt to enact mandatory laws dealing with these subjects.

The recommendation for publicity occurs in several chapters of the report so far made public. This means not only publicity of the operators' figures but also publicity as to the disposition as well as the source of funds of the United Mine Workers. The most serious direct criticism that the Coal Commission has made regarding the union is that the mine workers have devoted so little attention to the solution of problems affecting its membership through constructive study. It is apparent that the Commission will recommend against nationalization of the mines.

The Coal Commission during the last week has made

public several chapters of its report. One of these was conclusions on "Effect of Irregular Operation on the Unit Cost of Production of Bituminous Coal." A report was released on Sept. 14 giving the recommendations on "Labor Relations in Bituminous Coal Mining," followed on Sept. 17 with an extensive report on this subject.

The Commission released a report on Sept. 20 dealing with the causes and remedies for irregular operation and overdevelopment, and treating of transportation. Its findings on earnings and wages in the bituminous-coal industry and investments and profits in both anthracite and bituminous coal are yet to be published, as are the reports on living conditions and the wholesale and retail trade. It is understood that many of its reports will not be released for publication for several weeks.

Several briefs and statements were filed with the Commission during the week and the Bituminous Operators' Special Committee called on members of the Coal Commission Sept. 13 and renewed their offer of voluntary publicity of prices, costs, etc., through some governmental agency.

A statement in behalf of the National Retail Coal Merchants' Association was filed with the Coal Commission Sept. 13 in which criticism of Governor Pinchot's settlement of the anthracite suspension was voiced.

The wholesalers on Sept. 17 made a formal protest to the Commission on its press release of Aug. 30 regarding pyramiding of prices, alleging that it is unfair.

There has been no decision as to what will be the disposition of the records of the Coal Commission or those of the Federal Fuel Distributor, each of which expire by statutory limitation Sept. 22. The records evidently will go either to the Department of Commerce or to the U. S. Geological Survey. While their term of office will expire Sept. 22, the members of the Coal Commission will remain available to President Coolidge for consultation and advice unofficially after that date.

Pinchot Invites 30 Governors to Confer On Anthracite Situation

Governor Pinchot has sent letters to the Governors of thirty states which use anthracite coal, suggesting that they make an examination, with a view to personal conference later on, of the hard-coal situation in their states. The purpose of the investigation is to prevent unnecessary increases in the price of anthracite because of the wage increase agreed to by the operators and miners at the Harrisburg conference.

The letters were sent to the Governors of states using 1,000 tons or more a year of anthracite. The states are Connecticut, Rhode Island, Vermont, New Hampshire, Maine, New York, New Jersey, Maryland, Delaware, Illinois, Indiana, Iowa, Kansas, Kentucky, Louisiana, Michigan, Minnesota, Missouri, Nebraska, North Carolina, North Dakota, Ohio, South Carolina, Tennessee, Texas, Wisconsin, Alabama, Massachusetts, Virginia and West Virginia.

Abolition of Assigned Cars Deferred Until Nov. 1

The Interstate Commerce Commission has postponed the effective date of its order abolishing assigned cars until Nov. 1, 1923. This is the second time the effective date has been postponed. In its order dated June 13 the I.C.C. abolished assigned cars as of Sept. 1, but on July 25 the effective date was postponed until Oct. 1.

Anthracite Miners Ratify New Wage Agreement and Return to Work

Governor Pinchot's peace plan between the anthracite miners and operators, signed at Harrisburg by the union chiefs and operators nearly two weeks ago, was ratified at the tri-district convention of the miners at Scranton late in the afternoon of Sept. 17, the first day of the convention. The 155,000 mine workers who had been idle since Sept. 1 returned to work yesterday morning. The contract was not signed, however, until 1 p.m. at Milford, the home of Governor Pinchot.

In the convention hall, where 500 delegates representing every local in the hard-coal field were seated, there rose only twenty voices in objection to ratification. This little group represented some of the day men employed about the collieries, who are not satisfied with the 10-per cent increase.

Better Inspection and Education Will Lower Hazards of Mining, Says Commission

Increased inspection and continued education of all men in the industry are emphasized by the U. S. Coal Commission as outstanding factors in reducing the hazards of coal mining in a report on "Safety in Bituminous Coal Mining," made public by the Commission Sept. 18.

In this report the Commission states its conclusions on this subject with a summary of the findings of a committee selected by the Bureau of Mines at the request of the Commission to investigate this subject. This committee comprised: E. A. Holbrook, chairman, dean of Mining School, Pennsylvania State College; W. M. Wolfin, chief engineer, California Industrial Accident Commission; J. J. Rutledge, Chief of the Maryland State Bureau of Mines; W. B. Plank, head of mining department, Lafayette College; R. N. Hosler, superintendent, Coal Mine Section, Pennsylvania Compensation Rating and Inspection Bureau; J. H. Griftner, the Associated Companies, of Hartford; F. P. Hanaway, United Mine Workers of America; T. A. Furniss, Bituminous Operators' Special Committee, and W. W. Adams, statistician, U. S. Bureau of Mines. The detailed reports prepared by this committee will be issued later in three sections treating different phases of the subject.

In its summary of the findings of the committee and conclusions of the Commission, the Commission states that more men are killed from falls of roof and coal than from all other underground causes combined and that in many districts it is more dangerous to transport coal underground than to mine it. While mine explosions attract wide attention owing to the large number of men involved, the report states, the deaths underground from this cause are only 12 per cent of the total. Differences in laws, regulations, customs and appliances affect the accident rate more than any difference in natural conditions, it is stated. If accidents could be reduced, the average bituminous miner would live the normal life span, the Commission reports, as there is no positive evidence that soft-coal miners are subject to special occupational diseases.

Using the comparative compensation rates of Ohio and Pennsylvania as a basis, the report states that 10 per cent of all occupations listed take a higher rate than bituminous-coal mining and 90 per cent a lower rate. State mining laws and compensation insurance inspection are the two great factors for mine safety, the report states. The majority of the investigating committee felt that certification of miners is sound in theory and an aid to safety, but the operators' representative held that in practice this law gives control of all miners to the union.

The Commission declares that the Bureau of Mines has accomplished much for mine safety work, but that the appropriation given it for this purpose should be sufficient to double the present personnel and equipment. More safety service inspection work by the Bureau also is recommended.

Regarding inspection, the report states that there is too much politics in some of the state departments. The codes of some states need revision badly, it is declared.

Unification of basic points in the various state laws would increase safety, it is asserted. Every operating company should foster first aid, provide a safety inspector and personal instruction in safety to the miner. The union has exerted a positive influence in obtaining safety legislation, it is pointed out. The Commission declares that insistence on ability at least to understand spoken English should be made a condition of employment in coal mining or the employee should work under a foreman who speaks his language.

Overseas Coal Export Situation Improved Only Slightly Since July

Summarizing the overseas coal export situation as of Sept. 1, Federal Fuel Distributor Wadleigh says in part: "There have been no new developments in the coal export market during August. There are indications of a cleaning up of conditions in European markets brought about by the Ruhr occupation, but it is still considered useless and inadvisable to make any statements or predictions regarding the existing state of affairs or the future outcome of the conditions in the Ruhr district. The ocean freight market has been quiet and dull; rates are still at low levels and conditions but little improved over those obtaining in July. Prices continue at the lowest levels of the year, both at British ports and on this side."

In United States markets "actual charters reported for August have decreased as compared with previous months and export tonnages also have decreased. Inquiries, however, are still being made for future shipment and there seems to be a decided feeling of optimism in the trade as to the future of our export business. Prices of U. S. coals f.o.b. tidewater for export continue low, with but little change since Aug. 1. August tonnages of coal show a decrease as compared with those of July, which in turn were lower than overseas shipments during June and May. Export of coke overseas showed an increase during August although only two charters were reported as having been closed in that month."

Illinois Operators' Central Control Board To Replace Divided Representation

The three operators' associations of Illinois though remaining separate are proceeding definitely to organize a central control board the plan for which was accepted last month. Matters of labor and state-wide policy are to be placed in the hands of a committee of eight men, five representing the Illinois Operators' Association, two the Fifth and Ninth District Association and one the Central Illinois Association. Disagreements under the labor contract which cannot be settled by operators' commissioners with the men will be carried to this one board instead of to the several joint boards of association officials and miners which have previously functioned. Greater centralization of control over operators' affairs is hoped for. The appointment of the eight members is expected after an operators' meeting this week.

Federal Trade Commission to Probe Charge Of Pyramiding by Middlemen

The Federal Trade Commission, according to a press report, is preparing to investigate the charge of pyramiding of anthracite prices by middlemen. At a meeting on Wednesday the commission began work on a program for an inquiry based on a report issued by the U. S. Coal Commission Aug. 30, the probe to be conducted with a view to ascertaining whether wholesalers have been guilty of unfair trade practices in violation of the Federal Trade Commission Act.

American Mining Congress Adds Technologic Sessions As Adjunct to Its Annual Exposition

Beginning Sept. 24, the American Mining Congress will hold its Twenty-sixth Annual Convention and a National Exposition of Mines and Mine Equipment in the Auditorium at Milwaukee, Wis. This convention program divides itself into five parts covering Industrial Co-operation, the Problems of the Coal Industry, those of the Metal Industry, Standardization and Mine Taxation.

Under the first head it may be said that the Industrial Co-operation Division of the American Mining Congress, which is now functioning in twenty-three states, will be in charge of this section of the program. It will hold two sessions. The first will be at 2 p.m. Tuesday, Sept. 25, at which W. A. Grieves, chairman of the Industrial Co-operation Division, will present a report covering the work of the division. He will be followed by Norman W. Schlichter, of West Virginia, J. G. Bradley, of the same state, and other representative men. A second session of this division will be held on the evening of the same day in the Hotel Wisconsin at 6:30 p.m. Sidney J. Jennings, president of the American Mining Congress, will preside, and the speakers will include Lawrence F. Abbott, of the Outlook Publishing Co.; Edward J. Henning, Assistant Secretary of Labor, and Cleveland H. Dodge, representing the Phelps-Dodge interests. At this meeting there will be a general discussion of the work of the division.

The second group of discussions will relate to the problems of the coal industry. Albert J. Nason, of Chicago, Ill., will preside. The principal addresses will be made by J. C. Brydon, president of the National Coal Association; Frank D. Rash, president of the St. Bernard Mining Co., Earlington, Ky.; Philip Penna, of Indiana, and coal men representative of other districts.

STANDARDIZATION GROUP HAS FOURTH SITTING

The National Standardization Congress will hold its fourth annual session on the standardization of mining methods, practices and equipment. Its first meeting will be on Thursday, Sept. 27, at 10 a.m., at which addresses will be made by A. J. Durgen, special representative of the Department of Commerce, who will be present at Milwaukee at the special request of Herbert C. Hoover, Secretary of Commerce; Warren R. Roberts, chairman of the coal-mining branch of the Standardization Division of the American Mining Congress; Charles A. Mitke, of Bisbee, Ariz., who is chairman of the metal-mining branch of the same division of the congress, and Albert W. Whitney, chairman of the American Standards Committee.

In the afternoon of that day a joint conference will be held at which several reports will be presented and discussed. The reports will be on Drilling Machines and Drill Steel, Underground Power Transmission and Power Equipment, Mining and Loading Equipment, Mine Timbering, Metal-Mine Accounting, Underground Transportation and Mine Ventilation.

At 10 a.m. on Friday the committees reporting will be those on Mining and Smelting Practices, Outside Coal-Handling Equipment, Fire-Fighting Equipment, Mine Drainage, Methods of Mine Smelting, Mining Excavating Equipment and Mechanical Loading Underground.

The fifth general group of discussions will be devoted to the problems of taxation. Among those who are expected to address the meeting are Paul Armitage, of New York City; George E. Holmes, Wade Kirk of Joplin, Mo., and other well-known tax accountants and lawyers.

An entirely new feature of the convention, which runs almost continuously and every afternoon for three days is the Open Forum for discussion of equipment problems—informal discussions of the practical operating problems of mining men in handling, selection and adjustment of mine equipment and mine machinery under varying conditions.

The program in brief is as follows:

Tuesday, Sept. 25, Conference Hall

- 1:30 p.m.—Subject, Rock Drills; Chairman, D. E. A. Charlton.
Question—Churn Drills vs. Air Drills for Open-Pit Work.
- 2 p.m.—Subject, Explosives; Chairman, N. S. Greensfelder.
Question—Means of securing co-operation from miner in using explosives that will produce maximum quantity of lump coal.
Question—Disadvantage of dynamite cartridges of small diameter.
- 2:30 p.m. to 4 p.m.—Subject, Mine Transportation; Chairman, R. Dawson Hall.
Question 1—Advantages of standardized track gages and standardized frog switches and turnouts.
Question 2—Mine cars, their design and effective use.
Question 3—Effective lubrication of mine cars.
Question 4—When and where to use gasoline trolley and electric storage-battery locomotives.
Question 5—Roller bearings vs. plain bearings and other types of axles in mine cars and mine locomotives.
- 4 p.m.—Subject, Shoveling and Loading Machines; Chairman, R. Dawson Hall.
Question 1—Advantages of the caterpillar shovel.
Question 2—What are the principal requirements to consider in selection of underground loading and shoveling machines, and what are their limitations?
- 5 p.m.—Subject, Safety Appliances; Chairman, H. G. Bell.
Question 1—What can be done to further the development and introduction of safe equipment for hoists, pumping and loading machinery?
Question 2—Mine ventilation and its application to various mine conditions.

Wednesday, Sept. 26.

- 1:30 p.m.—Subject, Crushing, Screening and Separating; Chairman, C. F. Willis.
Question 1—What is the field for magnetic separators?
Question 2—Can manufacturers of crushers and screens work together more fully for mine operator's advantage?
- 2:30 p.m.—Subject, Underground Power Equipment and Transmission; Chairman, Percy Barbour.
Question 1—Alternating vs. direct current in mine operations from the standpoint of efficiency and safety.
Question 2—Relationship of feeder lines to return current.
- 3:30 p.m.—Subject, Pumps and Mine Drainage.
Question 1—Centrifugal vs. Plunger Pumps.
Question 2—Effective use of acid-resisting metal in pumps.
- 4:30 p.m.—Subject, Hoists and hoisting equipment; Chairman, D. E. A. Charlton.
Question—Hoists and their application to mine problems.

Thursday, Sept. 27, 1923.

- 2 p.m.—Subject: Power Plant Equipment in Mining Enterprises; Chairman, Percy Barbour.
- 3 p.m.—Subject, Power Transmission; Chairman, Percy Barbour.
- 4 p.m.—Subject, Use of Traveling Cranes in Mining.
Question—Are there any operations around a smelter or stamp mill in which a light mobile corduroy crane can be used to advantage?
- 4:30 p.m.—Subject, Welding in Mining.
Question—Advantageous use of various types of welding.

The convention will close on Friday evening at the annual banquet, where among the speakers will be Max W. Babb, vice-president of the Allis-Chalmers Mfg. Co., W. R. Finley, president of the Chicago & Northwestern Railway Co., and Irvine L. Lenroot, U. S. Senator from Wisconsin.

Production and the Market

Weekly Review

The soft-coal market slumped slightly following the settlement of the anthracite strike. Spot demand fell off and prices showed a slight decrease. Contract coals moved in good volume although consumers are indicating a desire to have shipments slow down. Spot business is barely sufficient to keep prices at their present level, and in some sections of the country no improvement is looked for now. Producers of soft coal are disappointed at the way the anthracite trouble was settled, particularly because of the increase in wages, declaring it will make it more difficult for them to deal with the union next Spring.

Coal Age Index for Sept. 17 shows a decline of three points to 202 from the previous week, with an average price of \$2.44, dropping back to the Aug. 27 figure.

Although the anthracite mines have been completely shut down, river dredging and culm washing netted about 5,000 tons during the week ended Sept. 8, in addition to which there were shipped approximately 1,000 cars of steam coal drawn from storage piles.

Soft coal is being produced on an average of 11,000,000 net tons weekly, notwithstanding slow demand and low prices. In August production was 48,864,000 net tons. The first eight months of the year recorded a total of 367,260,000 tons, 18 per cent ahead of the average production of the corresponding periods of the nine years 1914-1922.

Car shortage is increasing and there are fewer reports of no market, particularly in the Middle Appalachian region, Illinois and the far West.

One of the large producing companies announced an increase of 70c. per ton in the mine price of domestic coals early this week. Several other companies said they had reached no decision regarding their prices at that time. Consumers feel there is no need for anxiety regarding supply and are not showing great desire to fill their bins now.

The Chicago market reports a fair domestic demand for various coals, due to a drop in temperature, while

in the Northwest the demand for nearly all fuel, excepting anthracite stove size, dropped off following the settlement of the hard-coal strike. The Pittsburgh market is inactive for the same reason, while in New England there is no immediate improvement in sight.

Bituminous screened coal and coke as substitutes for anthracite have practically dropped out of the market. There is almost no call for the former and the demand for coke is much slower, with quotations for the latter lower than they were last week.

There is a feeling of optimism in the export trade despite the falling off in demand and inquiries during the past few weeks. While inquiries have been slow,

LAKE COAL DUMPED
(Net Tons)

	Week Ended Sept. 10	Season to Sept. 10
Cargo	756,917	19,616,851
Fuel	49,236	1,031,582
Totals	806,153	20,648,433

exporters believe that trade will soon pick up. Coal is accumulating at Hampton Roads and prices are lower.

Inquiry for Welsh anthracite eased considerably following the ending of the strike. Several cargoes are expected to reach the Atlantic seaboard within the next week or two.

Dumpings at Hampton Roads for all accounts during

the week ended Sept. 13 amounted to 327,871 net tons, as compared with 343,733 tons the previous week.

Chicago Prices Not Strong

A fair domestic demand for various coals around Chicago was caused by a cold snap lasting until Saturday. On that day the mercury rose. Weather observers prophesy warmth for the rest of September. Coal men, by the same sign, prophesy a slump in business. There is by no means enough business to hold all domestics firmly against the top quotation. Good Franklin County lump and egg sells for \$4.35 in spots, but a good deal of it moves at \$3.75@ \$4. Central Illinois lump has a hard time bringing \$3.25. Some sags to \$2.75. Steam business is slow with prices shading downward. Southern Illinois screenings run as low as \$1.25 under pressure and central Illinois to \$1.10. Nut coal is slow in all Western fields. Western Kentucky coal is offered in considerable volume in spite of car shortage with steam prices sliding. Smokeless mine-run moves steadily.

Around St. Louis, demand improved for both Mt. Olive and Standard lump for city and country, but smaller sizes drag. This backwatering of nut and screenings has kept mines idle half the time, though they have domestic orders booked for several weeks ahead. One operator in the Standard district hiked his lump price out of sight to stop orders. The St. Louis city trade is largely in the cheaper grades of coal. In anthracite, coke and smokeless there is practically nothing doing.

Kentucky Softens Too

Reduced demand for all kinds of Kentucky coals plus the end of the anthracite strike sufficed to soften prices on both eastern and western Kentucky coals even though a car shortage has developed. West Kentucky lump, which ranged from \$3 to \$3.25 last week, is now well below \$3 and good Eastern gas lump no longer goes at \$4@ \$4.25, but rather at \$3.50@ \$3.75. Steam buyers seem to be out of the market. West Kentucky slack, in one or two places has dropped as low as 75c., but averages 90c.@ \$1.25.

Although there is bituminous coal in plenty all through the Northwest the demand for almost all fuels except stove anthracite has dropped off because there is no further fear of an anthracite strike. In Duluth, dock operators stopped taking orders for a day or two to inventory hurriedly, fearing they had oversold the popular sizes, but discovered they had enough. In Milwaukee, where retail prices range about \$1.70 above Duluth, a state commission is going to find out whether the operators are basing their charges on rail freights rather than on lake-and-rail. Receipts on the docks are in good volume. There is plenty of time to get the normal winter's supply moved up the Lakes.

Not enough winter has struck the western and Rocky Mountain states to stir up much action in coal. In all fields the steam business is flat and small sizes are backing up while a thin business in domestic sizes goes ahead. Cars are in plenty, but in Kansas there is much complaint against too many flat bottoms. Prices there are unchanged. In Colorado, where bituminous demand is picking up some, circulars show these quotations: Walsenburg lump, \$6; nut, \$5.50; mine-run, \$4.25@ \$4.50; slack, \$2.25@ \$2.50; Trinidad lump, \$5; nut, \$4.75; mine-run, \$4@ \$4.25; semi anthracite egg and nut, \$7.50; chestnut, \$3. Utah mines are still working better than half time in spite of the slow steam

* Gross tons, f.o.b. vessel, Hampton Roads.
† Advances over previous week shown in heavy type, declines in italics.

This diagram shows the relative, not the actual, prices on fourteen coals, representative of nearly 90 per cent of the bituminous output of the United States weighted first with respect to the proportions each of slack, prepared and run-of-mine normally shipped, and second, with respect to the tonnage of each normally produced. The average thus obtained was compared with the average for the twelve months ended June, 1914, as 100, after the manner adopted in the report on "Prices of Coal and Coke, 1913, 1918," published by the Geological Survey and the War Industries Board.

market. Bunker coal for the coast is about to be reduced 90c. to stimulate business. Other prices are steady.

Ohio Market Quiet

The after-effects of all the talk that came along with the strike in the anthracite fields is being keenly felt in the Cincinnati market. Buyers who took eleventh-hour chances on filling up before a prospective period of distress have taken elasticity out of the market now that their wants are cared for, at least for several weeks ahead. In the Columbus market there was a slight falling off in steam demand at about the time of the anthracite settlement, operators having a brisk trade in these coals being the first to feel the change, although the general effect was to slow down the entire market. A lull was experienced by domestic producers. Producers and distributors, however, believe that the let-up is only temporary and look for better business towards the end of this month. Steam users who have been accumulating have stopped buying, while a survey shows that stocks in reserve will last from forty-five to sixty days.

Operators serving the Cleveland market say the general demand apparently is increasing in volume and inquiries are more numerous.

The coal market at Pittsburgh has turned quite inactive since the anthracite settlement, but cannot be said to have

had any great change in the fundamental relation between production and consumption. During August many consumers who had previously been hand-to-mouth buyers turned in and bought ahead for short distances. It is a question whether the dullness in the coal market is attributable entirely to the anthracite settlement.

With the adjustment of the anthracite dispute, production took a slump in the central Pennsylvania field. However, there is a high production, principally in the higher grades of fuel.

Peak of Dullness Almost Reached in New England

In New England it almost seems that the peak of dullness has been reached, but no improvement is in sight and it is likely to be thirty days at least before any buying materializes. The difficulty which shippers meet with in trying to dispose of cargoes here on the market shows how well saturated is this territory, and continued shut-downs and curtailments among several of the industries make buyers quite indifferent to any talk of high prices. Practically all the large consumers, railroads included, have such large reserves that deliveries even on contract have been reduced. In no direction does there seem promise of better business during the fall.

All-rail receipts from central Pennsylvania continue relatively light, shipments being confined almost entirely to contract requirements. Many operations are idle and spot orders for grades other than specialties are extremely hard to find. There has been a marked let-down in tonnage moved via the New York and Philadelphia piers, and more than a few shippers are being pressed to move accumulations.

At Hampton Roads there is hardly any spot inquiry from New England. While no outright quotation of less than \$5 per gross ton f.o.b. vessel has been heard the buyer is made to feel that lower offers would be accepted.

The soft-coal market at New York continues dull. Save for contract coals there is slow movement and the spot market is quiet. Shipments to tidewater, except on consignment, are slow. At Philadelphia no bad effects as the result of the hard-coal settlement were felt and the position of the bituminous market is considered better than fair, with prices indicating a betterment. The industrial situation is considered good and there is a growing tendency on the part of consumers without contracts to seek cover at least for a portion of their tonnage to April 1. There is little change in the Baltimore situation, while quietness has marked the Birmingham market. There is scarcely any demand for bunker coal at the Southern ports.

Shipments of Anthracite Eagerly Awaited

A small tonnage of anthracite domestic coals is being moved as the result of the strike. Producers have no coal to offer and quotations heard for coal on cars or in boats have been nominal. There has been some offering of washery egg, stove and chestnut sizes made at \$10@11 f.o.b. mines but sales have been slow. The steam sizes were plentiful and were quoted at around \$3.50 for buckwheat No. 1, \$2.50 for rice and \$1.50 for barley. Movement, however, has been slow. Dealers are anxiously awaiting the first shipments of domestic coals following the resumption of mining. Hard coal is in good demand in Toronto.

DUE TO THE SUSPENSION OF MINING in hard-coal fields and the practical stoppage of shipments from the mines, quotations are merely nominal, and are not printed. Coal Age quotations on anthracite will be resumed when the new prices are available.

And Export News

British Coal Production Increases Slightly;
Exports for August Show Gain

Production of coal in Great Britain's mines during the week ended Sept. 1 was 5,280,000 tons, says a cable to *Coal Age*. This is the largest weekly output since July 7 last, when it was 5,360,000 tons. During the week ended Aug. 25 output was 5,163,000 tons.

The South Wales market is quieter with prices slightly lower, due to the improved Italo-Greek controversy and the settling of the anthracite situation in the United States. Demand is insufficient to absorb the output. European buying is slightly heavier.

The wages of Welsh miners have been advanced in September by 3.85 per cent to 41.47 per cent over the standard of 1915. Earnings would have been larger but for June holidays.

The Newcastle market is better and inquiries are more free, the most business being done in the gas and coking sections.

Coal exports for the months of August, 1923 and 1922 as reported by the Board of Trade were as follows, in tons:

	1923	1922
Germany	1,215,000	1,166,000
France	1,561,000	940,000
Italy	513,000	476,000
Other countries	3,291,000	3,564,000
Total	6,580,000	6,146,000

Business Slow at Hampton Roads

The market at Hampton Roads felt the effects of the anthracite settlement in lessened activities, and in slackening inquiries. The dumpings at piers fell off, and little new business is in sight for the immediate future.

Export business showed a tendency downward, and the bunker trade was doing little better than holding its own. Coastwise business was on the upgrade, but did not show a sufficient increase to have any effect on the market.

For the first time in many months low volatile coal was actually offered on the spot for less than \$5. The tone of the market was dull, and the outlook not so bright.

French Market Firm; Demand Active

The French coal market is firm with demand for all grades, chiefly in house coals, active. Prices show a tendency to advance, Belgian sizes coals increasing 15 fr. and ovoids 10 fr. Imports of British coals are lower in spite of a decrease in prices for secondary industrial grades. From Aug. 21 to 27 the S.C.O.F. received 23,000 tons of coke from the Ruhr, making a total of 101,000 tons received during the first twenty-seven days of that month. Dur-

ing the first twenty days of August France and Luxemburg received 34,500 tons of coal, 67,100 tons of coke and 600 tons of lignite briquets. Announcement has been made that the price of German coke would be advanced 24 fr. to 388 fr.

News Items From Field and Trade

ALABAMA

The DeBardleben Coal Corporation has resumed operations at the Townley mines, in the Carbon Hill district of Walker County. These mines were taken over from the Corona Coal Co. in the recent merger, but an extensive rehabilitation program had been under way for several months by the former owners. Modern equipment for the mining, handling and preparation of coal has been installed and all machinery is electrically driven. The workings of Nos. 1 and 2 mines have been connected and the coal will be removed from the No. 1 slope. It is expected to increase development work and eventually attain an output to 1,500 or more tons daily.

The Alabama, Tennessee & Northern Ry., now operating between Chattanooga, Tenn., and Gadsden, Ala., is making preliminary surveys for the extension of the line from the present terminus at Gadsden to Birmingham, and also will establish physical connections with the Seaboard Air Line and Central of Georgia Railways, so it is reported.

ARKANSAS

Judge Youmans in the U. S. District Court at Fort Smith on Sept. 11 overruled a motion to dismiss the suit of the Coronado Coal Co. against the United Mine Workers of America, in which judgment is asked for \$2,222,000 as a result of labor riots in the Hartford Valley of Sebastian County, in 1914.

COLORADO

Colorado produced 689,254 tons of coal in July, employing for the purpose 11,472 men. This brings the total output for the year to 5,078,897 tons, 637,761 tons ahead of last year. This was done in an average of 87 days of operation.

ILLINOIS

The Chicago, Burlington & Quincy Ry. is building new double tracks from Woodlawn to Waltonville. The work is said to be a part of the \$2,000,000 improvement program and will greatly relieve the congested coal traffic between the southern Illinois fields and the Galesburg coal yards of the railroad. W. O. Frame, coal supervisor for the company at Herrin, is in charge of the construction work now going on at Waltonville.

Francis Lewis, mine manager for Mine No. 7 of the Consolidated Coal Co., Herrin, has been appointed superintendent of the Illinois Coal & Coke Co.'s mine at Virden, and will take charge at once.

Bids will be received and opened on Sept. 25 by the commanding officer of the U. S. Quartermaster Department at Chicago for furnishing and delivering 2,000 net tons of run-of-mine bituminous coal to Fort Sheridan, deliveries to be made in carload lots. Alternate bids for furnishing the same quantity of semi-anthracite, lump and run-of-mine also will be accepted and considered. Bids also will be received for furnishing and delivering 1,216 net tons of bituminous run-of-mine coal to the Fairfield Air Intermediate Depot at Osborn, Ohio.

INDIANA

Activities which are expected to result in a new coal mine for Hymera, in the northwestern part of Sullivan County, are well under way. The United Fourth Vein Coal Co. has ordered abstracts on the Ed. Vanarsdall farm near Hymera and officials of the company have informed Vanarsdall that they will exercise their option to buy his farm, both coal right and surface land. The Vanarsdall farm lies in the center of a 1,000-acre tract, near Hymera, that has been under option for several years. The coal has been thoroughly tested and is reported to be of fine quality in veins Nos. 5, 3, 2 and 1.

The Southwestern Indiana Coal Corporation, Evansville, has been incorporated with a capital of \$200,000 to mine and deal in coal. The directors of the company are William F. Quarrie, Frederick E. Reeve, Tom J. Phillips, Loris G. Julian and L. C. Oliver.

Announcement has been made of the election of C. C. Huestis as president of the newly reorganized Crawford & McCrimmon Manufacturing Co., of Brazil. Mr. Huestis will continue to make his home in Greencastle. The new industry which Mr. Huestis heads is one manufacturing mining machinery and special machines of various kinds and is one of the big concerns of the city of Brazil.

KANSAS

Several weeks of negotiations between the Southwestern Interstate Coal Operators' Association and District 14, United Mine Workers of America, for a machine mining contract for the Pleasanton field, which includes Linn County, Kansas, and Bates County, Missouri, terminated when the joint committee refused to ratify the report of a sub-committee which had agreed on a scale. Since then President William Bogartz of the Mine Workers has been publishing in newspapers in the district a warning against union miners going to the Pleasanton field. He asserts the mines are closed pending a contract. Efforts to make a machine scale for the entire district several weeks ago ended in failure.

The City of Burlingame has sold to the Bell Coal Co. the local steam power house. This will furnish power to the Fostoria mine and to the mine of the Miller Coal Co. The old power plant of the Bell Coal Co. has been sold to the Standard Coal Co., of Scranton, Kan. All mines will install electric machines. Operators in Osage County are organized to create and hold markets for their coal and among plans are some for joint retail yards in Topeka and other Kansas towns.

KENTUCKY

The trial of the suit of Thomas C. Fuller, of Lexington, against Stuyvesant Peabody, trustee, involving the 140,000 acres of coal and timber land in Clay, Harlan, Leslie, Letcher, Perry and Bell counties, purchased by Henry Ford from the F. S. Peabody Syndicate, is on the equity docket of the September term of the U. S. District Court, Eastern Division, which will convene in Frankfort Sept. 24 with Federal Judge Cochran presiding. Fuller, in his bill of complaint against the syndicate, alleged that the land sold to Ford is worth no less than \$15,000,000, and that the syndicate has contracted with the Fordson Company for a sale of the property for \$12,500,000 or \$2,500,000 less than its real value. He contended that he is the owner of a one-tenth interest in the property and that the syndicate is indebted to him in the sum of \$105,000, the amount being money which he put up to finance the project. Fuller seeks a receiver for the F. S. Peabody Syndicate and for a restraining order to prohibit the sale of the land to Ford until his rights and interests are determined by the court.

Lonnie Jackson, Mayor of Central City and president of District 23, United Mine Workers, who recently announced that no members of his organization could join the Ku Klux Klan without being fired from the miners' body, has been upheld by the city council of Central City, which has banned Klan meetings in the city.

The Kentucky Farm Bureau Secretaries Association, in convention in Louisville, went on record as favoring a coal tonnage tax on production, arguing for such a tax to be used for educational work in the state.

The Denmark Coal Co., of Madisonville, with a capital of \$20,000, has been chartered by Wayne Plymal, James C. Hurt and Robert P. Cox.

MASSACHUSETTS

Directors of the Island Creek Coal Co. on Sept. 11 declared an extra dividend of \$2 a share on the capital common stock, in addition to the regular quarterly disbursement of the same amount. The regular quarterly dividend of \$1.50 a share also was declared on the preferred stock. All dividends are payable Oct. 1 to stockholders of record Sept. 21. Three months ago the company paid an extra dividend of \$3 a share on the common stock. The company

produced 302,000 tons of coal in August. This compares with 277,000 tons in July and is the largest month's output since June, 1922. Output for the present year up to Sept. 1 is now about 1,230,000 tons. The following shows the rising trend of output figures during the past few months (in tons): April, 206,431; May, 224,978; June, 220,898; July, 277,000; August, 302,000.

MARYLAND

H. A. Cochran, recently promoted to the position of coal traffic manager of the Baltimore & Ohio R.R., with offices at Baltimore.

H. A. COCHRAN

has had long experience in railroading and is one of this country's experts on coal traffic. He served in an advisory capacity to Federal Fuel Administrator Garfield during the war.

MINNESOTA

Renewed interest in the possibilities of peat for fuel has been stimulated by the high coal cost. Tests have been made in Minneapolis as to what can be done with peat, but as yet the handicap has been the difficulty of drying and pressing into compact form.

Government figures on foods and fuel indicate that the Twin Cities are under the average large cities on food costs by 71c., but on hard coal the Twin Cities are \$2.40 higher than eight average large cities and on soft coal they are \$2.90 higher.

NEW YORK

Bids will be received and opened on Sept. 21 by the Quartermaster's Department, U. S. Army, First Avenue and 59th Street, Brooklyn, for furnishing and delivering in carload lots to various posts, camps and stations in Maryland and Virginia 13,255 net tons of 2-in. lump bituminous coal, and 1,537 net tons of mine-run bituminous coal to be delivered and trimmed in bunkers of government vessels at Norfolk. The coal is to be delivered during the period Oct. 1, 1923, to June 30, 1924.

The Parliament of Community Councils of New York City in resolutions has urged action by Governor Smith and special sessions of Congress and Legislature to pass legislation that will preclude prohibitive coal prices next winter, according to Jabez E. Dunningham, executive secretary. The resolutions ask that a special session of Congress be called for the purpose of enacting such legislation as either will regulate the proper mining of coal and its distribution at fair and reasonable prices, or that the Government of the United States take over such mines and operate the same for the public welfare.

Thomas F. Kelly, of Buffalo, has been appointed manager of the Smelters' General Briquette Corporation of New York City, specializing in the manufacture of briquets for smelting purposes — notably from iron flue dust. The new corporation has been organized to succeed the metallurgical department of the General Briquetting Co. Ellsworth B. A. Zwayer, of Perth Amboy, N. J., has been appointed manager of the General Fuel Briquette Corporation organized to succeed the fuel department of the General Briquetting Co.

The Montour Coal & Coke Co., Buffalo, controlled by the Milnes Coal Co., of Toronto, has discontinued business and the

books and accounts have been shipped to the parent office. John Adema, who was vice-president and manager of the Montour company, has engaged with the Barnett Coal & Coke Corporation as salesman.

The Board of Directors of the **Lehigh Valley Coal Sales Co.** have declared a dividend of \$2 per share, payable Oct. 1, 1923, to those stockholders of the company who are holders of full-share certificates of stock, registered on the company's books at the close of business Sept. 13, 1923.

The **Maier Collieries Co.**, an Ohio corporation, with capital of \$900,000, has filed its certificate of incorporation in the office of the Secretary of State at Albany and will enter New York State. H. S. Gould, of 37 Wall Street, New York City, is agent for the corporation.

Walter L. Banta has become vice president of the **Seeger Coal Co.**, New York City. Mr. Banta formerly was secretary and treasurer of the Fairbanks Co.

PENNSYLVANIA

The **Candlemas Coal Co.**, which recently took over the abandoned anthracite workings formerly operated by J. S. Wentz & Co., at Silverbrook, has announced that plans are under way for the erection of 20 blocks of houses at that place. The work is to be started soon. Silverbrook has been an abandoned mining village since 1907.

The State Bureau of Securities has issued final closing orders against the firm of **Evans, Sprague & Sturges**, promoters of the Chicago & Western Coal Products Corporation, Pittsburgh, and other firms in Allentown and Philadelphia, charging that the firm's advertising is misleading.

John L. Lewis, international president of the United Mine Workers, announced that a contribution of \$3,000 has been made to the Japanese Relief Fund by that organization.

By exploding a charge of dynamite in his month, **Peter Gallagher**, inside electrical hoisting engineer at the Cranberry Creek Coal Co., Hazleton, ended his life on Aug. 29. Worried due to differences between himself and the local union of the United Mine Workers to which he belonged, it is said, was the cause of the suicide. Mr. Gallagher resided at West Hazleton.

A state charter has been issued at Harrisburg to the **Horatio Coal Mining Co.**, Punxsutawney. Its purpose is mining, shipping and preparing coal for the market. The company's capital stock is \$25,000 and the incorporators are A. King Yost, Punxsutawney, treasurer; Peter C. Cameron and Glenn M. Cameron, Philadelphia.

The **Wilbur Coal Mining Co.**, the **Kniekerbocker Smokeless Coal Co.** and the **Somerser Mining Co.** have entered into a merger, the new company being known as the **Wilbur Coal Mining Co.**, according to papers filed at the State Department at Harrisburg. The central office of the company is at Johnstown and the capital stock is \$1,171,666.67. F. M. Graff, Blairsville, is the treasurer. The purpose of the company is mining and preparing bituminous coal for the market.

A law to compel operators and distributors marketing substitutes for anthracite entering interstate commerce to declare on their invoices exactly what these substitutes may be, so that the public may not be defrauded into paying the price of first class fuel, will be the object of a bill that will be introduced in Congress when it convenes by Congressman J. Banks Kurtz, of Altoona. If Congress favorably considers the proposition the public will be given the same protection when buying coal that is now accorded it when it buys articles of food, declares Congressman Kurtz.

The **West Penn Power Co.** recently purchased eight Westinghouse new model multiple retort underfeed stokers for its Springdale plant. They will be driven by eight two-speed three-phase motors complete with slide rails and controllers. Sixteen three-phase squirrel cage rotor motors also have been ordered to drive the rolls on the rotary ash discharge devices. These motors are actually capable of developing two maximum and two minimum speeds, giving a four to one speed ratio through two sets of poles, the stoker motors having six and twelve poles respectively and the grinder motors having six and eighteen poles respectively.

Workmen in the act of making excavations for a new building to be erected by Jacob Alinkoff, at Wilkes-Barre, ran into an outcrop of most valuable coal. Between 20 and 30 tons have already been mined. According to an old miner on the scene of the find, the coal is an outcrop of the Hillman vein of the Lehigh & Wilkes-Barre Coal Co. The vein is reported to be between 2 and 5 feet in thickness and of the finest grade of anthracite. Who will own the

coal is not known at present because it has not been determined whether the Michael Holton estate, from which Mr. Alinkoff bought the property, or the coal company has the mineral rights.

TENNESSEE

C. E. Klinger, of Pottsville, Pa., has purchased several large coal-lease rights near Chattanooga, and has announced plans of producing 2,000 tons per day of coal from his properties.

VIRGINIA

The **Clinch River Coal Corporation** of Virginia recently purchased the properties of the **Odle Coal Corporation** at Coeburn, on the Pocahontas Division of the Norfolk & Western Ry. The properties consist of 634 acres containing the Widow Kennedy and Banner seams. Production, particularly of domestic sizes, will be considerably increased.

Organized in October, 1921, with a capital stock of \$300,000 the **Glen Burke Coal Corporation** will soon begin operations on an extensive scale a few miles northwest of Richlands. Six mines have been opened with a view to mining a very high grade of coal, the coal to be loaded over a tippie equipped with shaker screens and provided with four loading tracks. It is stated that the tippie will have a capacity of 500 tons an hour. In addition to the usual plant buildings twenty-seven mining houses have already been constructed. Officers of the company are Lewis C. McNeer of Dante, president; Thomas T. McNeer, of Dante, vice-president; A. S. McNeer, of Richlands, assistant to the president; J. M. Rasnick, Richlands, secretary-treasurer; Frank R. Clark, Clinchco, general manager.

WEST VIRGINIA

The coal industry of West Virginia will be well represented at the annual meeting of the National Tax Association to be held at White Sulphur Springs, Sept. 24-28, if all the coal men designated by Governor E. F. Morgan of West Virginia as representatives of the state attend. Among those named by the Governor were the following: Joe L. Smith and T. H. Wickham, of the Winding Gulf field; Colonel Z. T. Vinson, of Huntington; W. M. Wiley, of Sharples, general manager of the Boone County Coal Corporation; J. C. Pack, of Bramwell; S. A. Scott, general manager of the New River company; Dr. Gory Hogg, of Harvey; John Laing, of the Wyatt Coal Co., and G. H. Caperton, of the South Side Coal Co., of Charleston; J. J. Lincoln, of Elkhorn; Edward O'Toole, general manager of the United States Coal & Coke Co., of Gary.

An attempt was made early in September to burn down the tippie and conveyor of the **Sunbeam Coal Co.** at Fort Branch in the Logan County field. The fire was discovered by Thomas T. Perry, mine foreman, who extinguished the blaze without assistance and saved the property from destruction. An examination of the origin of the blaze showed unmistakably that it was the work of firebugs bent on destroying the structure. Within 24 hours another attempt was made to destroy the property, the night watchman seeing a man enter the conveyor system. A search failed to reveal the presence of the intruder and he is believed to have fled before the property could be surrounded.

Albert O'Neal, of Pax, who has been connected with the Packs Branch Coal Co. at Pax, has resigned his position with that company to become superintendent of the **Ingram Branch Coal Co.** at Ingram Branch.

In finally prevailing upon 450 striking coal miners at the Barrackville, W. Va. mine of the Bethlehem Mines Corporation to return to work, officials of the United Mine Workers not only do not condone the strike but have stated semi-officially that the strike was the result of underhand work on the part of the **Howatt-Hamilton** element opposed to John L. Lewis.

R. E. Taggart, who has been in charge of the mines of the Stonega Coal & Coke Co. at Big Stone Gap, Va., as general manager, has been appointed as general manager of the properties of the **New River Collieries Co.** recently taken over by the Wentz interests, of Philadelphia. This company operates mines at Eccles and Sun, and the understanding is that Mr. Taggart will make his headquarters at Eccles.

George Morrow, one of the leading coal operators of the Kanawha field and one of those largely interested in the Hazy Eagle Collieries Co., which he organized, died at his apartments in the Peyton Building, Charleston, on Sept. 8 as the result of self-inflicted bullet wounds. Ill health and business worries are thought to have been responsible for his act, as he had been in

a despondent condition for some time. His business troubles, however, friends think, were more fancied than real. George Morrow established his home in Charleston about six years ago, at which time he organized the Hazy Eagle Collieries Co. operating on the Coal River branch of the Chesapeake & Ohio R.R. From that venture he is said to have received large returns. Before organizing the Hazy Eagle company, Mr. Morrow had been a salesman for the Pittsburgh Gage & Supply Co. in the Kanawha and New River fields. Mr. Morrow's former home was at Weirton, in Hancock County, where he has an aunt and other relatives. His body was taken there for burial.

As a result of the special convention of the miners of District 17 held at Charleston early in September following an agitation growing out of the last miners' election, an amendment has been adopted to the constitution of the district providing for the recall of officers under certain conditions. The convention also directed the executive board of the district to hold a new election for vice-president. That was the office to which R. M. Williams, who was the instigator of the movement for a special convention, aspired, but he was ruled off the ballot by the executive board, William Petry being elected vice-president. Under the terms of the new amendment a petition of only 10 per cent of the membership will be required to call for the circulation of a recall election and it will require only 30 per cent of the membership to demand such an election. The district executive board reversed its decision removing the name of Williams from the ballot and was sustained by the convention. It is stated that a new election will be held as soon as possible.

WASHINGTON

Roslyn coal mines were awarded several large contracts when the State Department of Business Control Aug. 30 bought its coal for the various state institutions. The Roslyn Fuel Co. was awarded three contracts, as follows: 5,000 tons at \$6.95, to Eastern State Hospital, Medical Lake; 1,500 tons at \$5.04, Ellensburg Normal School; 1,500 tons at \$6.50, Cheney Normal. The Roslyn Cascade Coal Co. was awarded the following contracts: 3,000 tons at \$6.95, Custodial School, Medical Lake; 5,900 tons at \$7.40, Washington State College.

WISCONSIN

The Wisconsin department of markets has issued a warning advising all people of the state to be careful in placing coal orders to avoid obtaining low-quality fuel. The action of the department was caused by the activities in the state of so-called "snow birds" who buy up coal at bargain prices, irrespective of grade or quality, and ship it to some unsuspecting agent or representative who has been induced to tie up with the proposition. Milwaukee, Fond du Lac, Madison, Racine, Janesville and many other cities have been flooded with literature of these scoundrels.

WASHINGTON, D. C.

The Membership Committee of the National Coal Association for the coming year is as follows: Walter Barnum (Chairman), treasurer, Pacific Coast Co., New York; George S. Brackett, executive vice-president, Northern West Virginia Coal Operators Association, Fairmont, W. Va.; E. R. Clayton, secretary, Harlan County Coal Operators Association, Harlan, Ky.; Ira Clemens, president, Clemens Coal Co., Pittsburgh, Kan.; L. C. Crewe, president, LaFollette Coal & Iron Co., LaFollette, Tenn.; George B. Harrington, president, Chicago, Wilmington & Franklin Coal Co., Chicago; W. L. A. Johnson, general commissioner, Southwestern Interstate Coal Operators Association, Kansas City, Mo.; D. C. Kennedy, secretary, Kanawha Coal Operators Association, Charleston, W. Va.; F. S. Love, general manager, Union Collieries, Pittsburgh, Pa.; W. F. Megeath, president, Roundup Coal Mining Co., Omaha, Neb.; C. J. Neekamp, secretary, Northeast Kentucky Coal Association, Ashland, Ky.; R. M. Randall, general manager, Consolidate Coal Co. of Saginaw, Saginaw, Mich.; W. J. Sampson, president, Witch Hazel Coal Co., Youngstown Ohio; H. N. Taylor, president, U. S. Distributing Corporation, New York; Jonas Waffle, secretary, Indiana Coal Traffic Bureau, Terre Haute; D. B. Wentz, president, Stonega Coke & Coal Co., Philadelphia.

CANADA

By an order of Justice D. A. McDonald, in the Supreme Court of British Columbia,

the Fleming Coal Co. has been declared bankrupt. The order was not opposed by the defendant's counsel. The company owns a property in the Middlesboro field, near Merriitt, and for some time has been developing a 6-ft. seam of coal, which, however, has two persistent rocky partings, making operations difficult and costly. Last year the mine produced a little less than 40,000 tons of coal.

The recent appointment of Thomas Graham to the position of general manager of the Canadian Collieries (D) Ltd., in place of J. M. Savage, deceased, has created a very favorable impression in coal-mining centers on Vancouver Island and among business men throughout the province. The same may be said of the announcement of the elevation of Charles Graham, a brother, to the post of general superintendent, formerly held by Thomas Graham.

After a conference between C. A. McGrath and J. A. Ellis, federal and provincial fuel controllers, and Premier Ferguson and Charles McCrea, Minister of Mines, at Toronto recently, relative to Ontario's fuel supply for the coming winter, Premier Ferguson announced that arrangements are being made to have municipalities appoint local fuel controllers for the purpose of regulating the distribution of anthracite and fixing the price per ton locally. This latter action is necessitated, said the Premier, by reason of the difficulty of a central fuel controller fixing prices for outlying places with the transportation conditions and other exigencies of which he may not be familiar. Local municipal fuel controllers will have power to fix prices through having authority delegated to them from the provincial fuel controller.

John L. Lewis, president of the United Mine Workers, has notified the members of local unions and members of the organization in Nova Scotia that they must recognize the provisional officers and pay into the treasury their per capita tax. Silby Barrett is the president of the provisional district and Lewis McCormick is secretary-treasurer. Since the old board of executive officers were deposed, it is stated, several of the locals have refused to pay to Mr. McCormick the monthly per capita tax. The Dominion Coal Co. is making preparations to start work on a new colliery at Langan Bay. The shaft will be about 1,000 ft. deep and will be equipped with the latest machinery and working appliances. Workmen are already engaged in constructing a branch road from the main railway near by.

Obituary

C. W. Steward, a pioneer retail fuel dealer of Minneapolis, died recently, after a residence of 52 years in the city.

Henry G. Williams, former general manager of the Utah Fuel Co., Salt Lake City, is dead at Los Angeles. Mr. Williams was in his 70th year. He left Salt Lake City two years ago. He served the company in an advisory capacity until last year. He was regarded as one of the leading coal-mining engineers in the West.

Percy L. Dubois, for many years a director in the Consolidated Coal Co. of St. Louis and auditor of that company, died at the Barnes Hospital in St. Louis, Sept. 1, after an illness of several months. Practically all of his life he was connected with the Consolidated Coal Company's interests. He leaves a widow and was a member of many of the country clubs and ranked high in Masonic circles.

James Ewan Robertson, senior partner of James E. Robertson & Co., El Paso, Texas, died suddenly at his home Aug. 5. Mr. Robertson was a son of Major James E. Robertson of Appomattox County, Virginia, who served four years in the 20th Virginia battalion of heavy artillery in the Confederacy. His mother was a descendant of Lord Delaware and Governor Spotswood, one of the Colonial governors of Virginia. About twenty years ago Mr. Robertson went to El Paso, where he was connected with the El Paso Smelter, later entering business for himself. At the time of his death he was one of the most widely known men interested in mining in Mexico, California and the Southwest. Mr. Robertson is survived by his widow, two sons, James E., Jr., of Los Angeles, Calif., and Dave W., with the New York office of the H. H. Robertson Co., which his father also represented, and one daughter, Mrs. Alice Summerill, of El Paso. The business which Mr. Robertson established will be carried on by his partner, Francis Wagner, of El Paso.

Publications Received

Coal Age is prepared to present to many of its readers a copy of a bound volume of "Legal Decisions Affecting Coal and Coke," prepared and compiled by Arthur L. H. Street, of the Minnesota Bar, and reprinted from *Coal Age*. This is a valuable book of 128 pages and should be on the desk of every coal man. It can be obtained by sending 25c. to cover the cost of mailing.

Traffic News

The Minnesota State Railroad and Warehouse Commission has applied to the I. C. C. to intervene in the hearing on users of anthracite coal from all over the country. The attitude of the Minnesota board is not determined but will be governed by the evidence. The board will seek to prevent any increase of freight rates, and if possible, will seek to secure reductions.

Anderson (Ind.) retail coal dealers have filed a complaint with the Interstate Commerce Commission through the Indiana Coal Merchants' Service Bureau, asking a reduction in freight rates from the West Virginia and Kentucky coal fields. It is said that many points in Illinois and Ohio have considerably lower rates on coal from West Virginia and Kentucky than Anderson.

The Norfolk & Western R.R. has made application to the Interstate Commerce Commission for authority to acquire control of the Big Sandy and Cumberland R.R. and other short lines of road in the vicinity of Devon, W. Va. The Norfolk & Western has agreed to pay approximately \$600,000 for the new property, which is held by the W. M. Ritter Lumber Co.

Officials of the Louisville & Nashville R.R. have announced that the State of Georgia has withdrawn objections filed against the road taking over a 999-year lease on the Carolina, Clinchfield & Ohio R.R., and the only protests now are those of the Seaboard Airline and one or two small roads, which have filed protest before the Interstate Commerce Commission. The latter protests are merely to protect business in hand, and are not likely to be seriously considered, whereas the proposed connection between the L. & N. and the C. C. & O. will be of vast advantage to the L. & N. and Atlantic Coast Line.

In the matter of New Mexico Ry. vs. Atchison, Topeka & Santa Fe Ry.—Docket No. 13755—the Interstate Commerce Commission upheld the report of the examiner and dismissed the complaint. The complainant prayed that the defendant be ordered to turn over its company coal to the complainant for transportation from Kennedy to Willard, N. M., at a charge to be prescribed, and that through rates and joint rates and reasonable and equitable divisions of such joint rates be established on commercial coal from points on the defendant's line in the Raton district, N. M., via complainant's line to points on defendant's line in eastern New Mexico and Texas. It was found, however, that the commission is without power to require the transportation of defendant's company coal by complainant and that the existing through route for commercial coal over defendant's line is not unreasonably long as compared with a route via complainant's line.

Approximately sixty companies, including railroad, steel, iron, coke, glass and others, have petitioned the commission for a rehearing of the case, the majority of them declaring they did not have an opportunity to present important evidence at hearings held prior to the commission's ruling that the assigned car rule should be abolished. It is understood that one of the principal reasons for the latest further postponement of the effective date of the order is that the commission desires to have its full membership act upon the many petitions for a rehearing of the case, and as a number of the commissioners will not return until after Oct. 1, this would be impossible unless the date was extended.

Civic bodies of St. Paul, Duluth and Minneapolis have filed a protest with the I. C. C. against the proposed 11c. reduction on coal from the docks to the Twin Cities, and suggest a rate of \$1.50. The protest states that the carriers had about decided on a voluntary rate of this amount several years ago, when the commission's distance schedule allowed the present rate of \$1.82, which was put in. They refer to a rate of \$1.70 proposed by the State Railroad and Warehouse Commission on northbound shipments

as intended to be a maximum rate to protect isolated communities from excessive rates and was not intended to govern the heavy tonnage moving from the docks to the Twin Cities, which is claimed to be immensely profitable—unreasonably so. There should be a final ruling from the I. C. C. on the complaint of the dock association as to the relative rates on coal from the docks and from the all-rail fields. The hearing was held last May, and the arguments made in June. The examiner's report was made a month or so ago, and the decision should be coming along soon.

Railroads of the United States, according to the Car Service Division of the American Railway Association, loaded more cars with revenue freight during the week which ended on Sept. 1 than during any week heretofore in history. The total for the week was 1,032,567 cars, which exceeded by 22,635 cars the previous record, established during the week ended Aug. 25. Despite the fact that the loading of revenue freight for the week of Sept. 1 was the greatest in the history of the nation, the railroads on that date had 66,559 surplus freight cars in good repair and immediately available for service if necessary, while the reported car shortage was only 9,441 cars for the entire country. This is the twelfth week this year the million car loading mark has been exceeded, and in eight of the twelve weeks the total has exceeded the record established during the week of Oct. 14, 1920, when 1,018,539 cars were loaded.

Coal loading during the week of Sept. 1 was 206,610 cars, 3,534 cars above the week before. This also was an increase of 57,383 cars over the corresponding week last year and an increase of 52,024 cars over the corresponding week in 1921. Coke loading totaled 13,970 cars, an increase of 457 over the previous week. This also was an increase of 5,587 cars over the corresponding week in 1922 and an increase of 9,238 cars over the corresponding week in 1921. Loading of revenue freight this year to date totals 33,161,743 cars compared with 27,607,701 in the corresponding period of 1922 and 25,754,571 during a similar period two years ago.

Readjustment of freight rates was discussed by representatives of the agricultural, manufacturing, labor, mercantile, banking and transportation interests constituting the Rates Committee designated by the Chamber of Commerce of the United States, at a meeting Sept. 12 in the board room of the Chamber in Washington. The rate question was approached by the committee as one of readjustment rather than reduction. Whether certain rates, such as those on light and bulky freight made up usually of manufactured products moving in less than carload lots, are not too high in relation to rates on heavy commodities such as wheat and coal, forms the chief topic of the report which will be submitted to Julius H. Barnes, president of the National Chamber. With the reports of the four other committees on Regulation, Consolidation, Waterways and Motor Transport, it will constitute the basis of discussion for the forthcoming general conference on transportation.

Coming Meetings

The American Mining Congress will hold its twenty-sixth annual convention in conjunction with the National Exposition of Mines and Mining Equipment, Sept. 24-29, at the Milwaukee Auditorium, Milwaukee. Secretary, J. F. Callbreath, Washington.

National Safety Council will hold its twelfth annual safety convention at the Buffalo Statler Hotel, Buffalo, N. Y., Oct. 1-5. Secretary, W. H. Cameron, 168 No. Michigan Ave., Chicago, Ill.

Fifth annual general Western meeting, Canadian Institute of Mining and Metallurgy, Oct. 3-5, at Estevan, Saskatchewan, Canada. Secretary, G. C. Mackenzie, Drummond Building, Montreal, Que., Canada.

American Gas Association, annual meeting Oct. 15-19, Atlantic City, N. J. Secretary-Manager, Oscar H. Fogg, 342 Madison Ave., New York City.

The West Virginia-Kentucky Association of Mine, Mechanical and Electrical Engineers will hold its annual meeting Oct. 19-20 at Huntington, W. Va. Secretary-treasurer, Herbert Smith, Robson-Prichard Bldg., Huntington, W. Va.

Coal Mining Institute of America will hold its annual meeting Dec. 19, 20 and 21 at Pittsburgh, Pa. Secretary, H. D. Mason, Jr., Chamber of Commerce Building, Pittsburgh, Pa.

COAL AGE

The Only National Paper Devoted to Coal Mining and Coal Marketing

NEW YORK, SEPTEMBER 27, 1923

Number 13

The Coal Commission's Legacy

A YEAR AGO the people of this country and the coal industry, both labor and capital, entered into what was essentially voluntary arbitration without binding award of a perplexing matter, the coal question. None was satisfied with the way the coal business was being conducted. The public thought the price too high and the supply too often short. The coal men were suspected of being robbers and profiteers.

The miners were as unsettled as the Balkans, perennially striking or threatening strikes. The operators were writhing under a crossfire of congressional investigation, popular denunciation and perpetual trouble with labor. There was no peace in coal.

A commission was proposed to investigate, get all the facts and tell the country the truth about coal. The operators urged it upon the President; the miners said they only wanted the facts made known. The public hailed the idea with delight. A United States Coal Commission was authorized by Congress, its personnel was selected by President Harding. It has now run its allotted course, spent its time and money and reported its findings.

No party to the proceedings is going to be wholly satisfied with the results. In fact the first reaction is certain to be positive dissatisfaction on all sides. This is a point distinctly in favor of the Commission's work. A report that pleased one party only could not have been conclusive or fair. Unanimous findings imply concessions. Imagine the banality of a report on which J. G. Bradley and John L. Lewis as members of a commission could come to unanimity of conclusion!

The great majority of the public, whose knowledge of coal is confined to newspaper headlines and check-book stubs, is going to be most woefully disappointed. The anthracite consumer is told that the fundamental evil in the anthracite industry is that of monopoly; that the one remedy short of price fixing or government ownership, which the Commission does not recommend, is through taxation, taking back to the public treasury in proportion as the profits are large or small, but without cutting the price of coal.

It is repeatedly driven home that the public must know more about this great industry and be guided by facts rather than by rumors and prejudice. It is plainly stated that for lower prices for hard coal the consumer must look to himself. "There are substitutes for hard coal and a readiness to resort to them is the ultimate and effective defense against an unreasonable price." This is the soundest kind of economic reasoning. It is true and being true it absolutely belies the previous statement that the anthracite industry is fundamentally a monopoly.

The Commission pays tribute to the economic organization of the anthracite industry by planning measures that will bring the soft-coal industry to the same state

of compactness, large units, regularity of operation, and natural division of markets. So "desirable" is this state of absence of overdevelopment and of irregularity of operation that the Commission is not content to facilitate natural processes to bring soft coal to that happy state but urges artificial measures, as licensing of interstate coal traffic and "granting and withholding of transportation service through supervision."

Senator Frelinghuysen's "fact finding" under the alias of "Publicity of Accounts" is offered by the Commission as a panacea for the ills of the whole coal industry. Much, but by no means all, that is claimed for current publicity of facts about coal can reasonably be expected. Certain as it is that there can be no solution of the coal question from any quarter or by any means without full knowledge of the facts, it is idle and indeed futile to expect the facts unaided to carry to the proper conclusion. The industry itself will profit most from "permanent and co-ordinated" fact finding and quite properly has given its prior acquiescence to the program. It may be pardoned, however, if it holds its nose while swallowing the nostrum that already, in the conclusions of the Coal Commission, gives off the odor of permanent regulation.

Of course coal mining is an indispensable service. Every point the Commission makes to establish this contention is sound. It is an economic fact that almost goes with the saying. There is a vast difference, however, between the economic fact of an indispensable service and the legal fact of a public utility. The line of reasoning by which the Coal Commission would put coal under regulation by the Interstate Commerce Commission will put a long line of industries in this country in the same position.

What the Commission terms its final report is but a partial summary of its work. It is mainly concerned with the question of publicity and the future regulation of the industry. The document is significant for the subjects that it does not cover or but mentions in passing. These are matters relating to labor. Throughout the body of its reports the Commission recognizes large scale strikes as the fundamental cause of coal shortages and high prices, but it nowhere treats of the fact of the labor union as an economic force. The Commission sees the labor question only as a negotiator. It has passed by the bigger question.

There are immense possibilities for good to come from the tremendous work of the Coal Commission and that good can come only as the government and the consumer, but first of all the operator and union, build on the groundwork of facts, which after all is its principal legacy. Though the conclusions and recommendations of this Commission are not binding they are certain to bear heavily on the future of the coal industry.

Hammond and His Associates End Year's Labors; Completed Report Comprises 800,000 Words

The United States Coal Commission, appointed Oct. 10, 1922, by President Harding, expired by limitation on Sept. 22, 1923, one year from the effective date of the act which created it.

The Commission held practically no formal hearings and save in the one instance of the Washington (D. C.) retail dealers took no formal record. Members of the Commission made one visit to the soft-coal fields, in Alabama, and one trip through the anthracite region. The Commission was in more or less continuous session in Washington for eleven months. It took an active part in the negotiations between the bituminous-coal operators and the union miners that led to the signing of the present contract, and it was the means of bringing the hard-coal operators and miners together after their deadlock in August.

The reports of the Coal Commission include the preliminary report of Jan. 15 and the report of July 5 on the Anthracite Industry, together with the accompanying reports on Earnings of Anthracite Miners; Labor Relations in the Anthracite Industry; Cost of Production of Anthracite; Revision of Wage Structure; and Investment and Profits in the Anthracite Industry.

During the present month, the report on the Bituminous Coal Industry has been prepared for issue in separate chapters as follows:

Civil Liberties;

Effect of Irregular Operation on the Unit Cost of Production;

Labor Relations, both as a summary of recommendations and as a full discussion;

Relief from Irregular Operation and Overdevelopment;

Safety in Bituminous Coal Mining;

Waste of Coal;

Earnings;

Wage Rates;

Labor Turnover;

Description of Mining Population;

Costs of Living;

Living Conditions;

Engineering and Management;

Wholesale and Retail Coal Trade;

Storage and Fuel Economy;

Purchase of Coal on Contracts;

Cost of Production;

Investment and Profits in the Bituminous Industry.

Appendices on these and other subjects resulting from the Commission's study will be later transmitted to the Congress.

The completed report of the Commission will comprise something over 800,000 words, equivalent to eight standard books. These reports are being issued now in part only and in mimeograph form, as the Commission had no funds for printing. It is expected that Congress will later order the reports printed in full.

The Commission had an appropriation totaling \$600,000, of which all but about \$20,000 was spent. Its office and field force at one time numbered nearly 500.

United States Coal Commission

Left to right—E. E. Hunt, (Secretary), C. P. Neil, E. T. Devine, John Hays Hammond (Chairman), Thomas Riley Marshall, Clark Howell and George Otis Smith

Final Report of U. S. Coal Commission

Conclusions and Recommendations Summarized for Government, Industry and Consumer

Federal Regulation Urged to Stabilize Industry and Protect Public—Broad Program for Economic Reorganization of Bituminous Industry Laid Down—Use of Substitutes Only Remedy for High Price of Anthracite

IN RENDERING its final report the United States Coal Commission reiterates the premises stated in its earlier reports: The coal-mining industry is not only one of the largest in our country but its uninterrupted service is essential to the well-being of the whole people; the condition of this key industry affects directly and in large measure the prosperity of all American industry; the large public interest in coal raises fundamental questions touching the relation of private right to public welfare; but underlying these questions in economics and law are the issues of peace in the industry and justice to the individual—issues that strike deep into the heart of American institutions.

An unfailing supply of coal at the lowest prices consistent with just returns to mine workers and mine owners is what the public needs and can rightfully demand of the coal industry. It was to find the major facts throwing light upon this complex problem that this commission was created. At the close of its investigations, extensive in scope but limited in time, the Commission has presented its findings in a series of chapters and there remains the task of briefly stating the underlying purpose of the inquiry and of summarizing the specific recommendations based upon the results of the inquiry.

Coal Mining an Indispensable Service.—Food and water alone outrank coal among the necessities of life. An uninterrupted supply of these three is a requirement of urban life as we know it today. Though anthracite ministers to health and comfort in several million homes, bituminous coal is the real foundation of the great industrial and transportation structure which enables more than a hundred million people to live in America and be so well supplied with all those things necessary for their health, comfort and convenience, and bituminous coal also furnishes domestic fuel for two-thirds of the homes of the land. Therefore the mining of coal in 29 states, its interstate transportation, and its country-wide distribution together make up a service indispensable to the general public. Shut down its coal mines and the whole country would soon be not only cold but idle and hungry.

Examine the long list of commodities whose current prices are used in computing the official index of the cost of living: Of the forty-three articles of food, from meat to fruit, the only ones into the production of which coal does not directly enter are "strictly fresh" eggs and fresh milk, and even those reach the market behind the steam-driven locomotive. The Western and Southern fruit that appears on the Eastern breakfast table costs its weight in coal in the form of ice or locomotive fuel. Next in the list come articles of clothing, furniture, and household utensils, every one of

which was manufactured by the use of coal-generated power.

Under the heading of fuel and light, only wood and kerosene, which enter into few family budgets of today, are free from a content of coal. And even the large item of rent, which next follows, represents expenditure of coal in the past, for from the moment the steam-shovel starts the excavation until the last coat of paint is applied coal is an essential component in the construction of a modern building, each structural material, whether steel or brick, cement or glass, being largely the product of coal burned at furnace, kiln or factory; the brick and cement on which rent is paid represents one-quarter to one-half their weight in coal, while every ton of metal has cost two, three or even five tons of coal. Although appearing but once in this long list of the necessities and luxuries of life coal is thus an ever-present element in the cost of living.

Or, if you will, review the everyday experiences of the average citizen: His day may begin with the pressing of a button, when coal acting through the electric light leaps to his service; or it may be coal in the form of gas that furnishes the light as well as cooks his breakfast. Coal next serves him in the power supplied for his ride to his place of work, where a power-driven machine is his helper throughout the day; or if his work is at a desk he is taken to his floor in the office building by elevator—a transportation service that in New York City alone consumes a quarter of a million tons of coal a year. Whatever the nature of his day's task, it is difficult to imagine the city worker who is not served every hour by coal manifest as light, heat or power. In the home equipped with modern conveniences this continuous and silent service rendered by coal in the form of gas and electric current is so great that in a year it may involve the expenditure of as many tons of bituminous coal at the distant gas plant and power station as there are tons of anthracite burned in the home itself. It is this unseen coal whose indispensable service is so unappreciated, if not wholly overlooked.

On the farm also the contribution of coal to daily life is great. The story of wheat is a story of coal. Every article of farm machinery, which makes farm labor so effective, represents the expenditure of coal at steel plant and factory; coal also in the form of nitrogen fertilizer, from the coke ovens, now reaches the farm to the amount of hundreds of thousands of tons a year; and the coal supply required at harvest time to drive the threshing machinery in the great wheat region is so large as to warrant a strong claim for special priority in times of coal shortage. The movement of this country's crops to market is on a scale so large that it could be accomplished by no other conceivable form of transport than coal-driven railroads. And at

COAL MINING AN INDISPENSABLE SERVICE

Coal enters into the cost of all commodities figured in the official index of cost of living, save eggs and milk. Dependence upon coal is country-wide and all embracing. Coal is affected with a public interest arising from the clear and direct obligation to the public of continuous production, transporta-

tion, and distribution. The indispensable service which the coal mine performs gives a large social value which in effect grants to the public an interest in that use and creates a compelling reason for public control. The Commission notes that here it is passing upon an economic fact and not the law.

the flouring mill, coal continues the work of preparing the wheat for use, and when the flour is brought to the city baking plant more than a third as much coal as flour is required to make bread. Indeed, next to iron and steel in the long list of manufactured products it is the foodstuffs that represent the largest consumption of coal.

Yet, the forty thousand tons or more of bituminous coal that invisibly reaches our tables every day is of little moment as compared with the coal that makes up the staff of life of our industries. The distribution of the year's output of the bituminous mines tells the story: 28 per cent goes to the railroads, 25 per cent to the boiler houses of factories and mills of all kinds, 15 per cent to the coke ovens and gas plants, 10 per cent to the homes, 7 per cent to steel plants and the same percentage to power plants and street railways, 4 per cent is exported to Canada or overseas, 2 per cent is used at the coal mines for necessary power, and the remaining 2 per cent goes to the seaboard for steamship fuel. In these proportions bituminous coal is the driving force of modern industrial and commercial activity.

This dependence upon coal is not only country-wide but all-embracing: every man, woman and child is the beneficiary of coal. So it is that absolute public necessity is back of the demand for continuous service from the coal mine and from every agency responsible for the transfer of coal from mine to place of use. As the direct source of the energy that turns most of the wheels of an industrial nation, coal affects the community at large to a degree that is not generally realized until the continuity of this service is threatened. Twice within four years both transportation and industry have been threatened with partial paralysis due to wage disputes in the coal industry. The dependence of our whole industrial structure upon the continuous production of coal has been too obviously demonstrated by these two instances to leave room for any further debate on the relation of coal to the public interest.

Bituminous coal enters into interstate commerce on a scale approached by no other commodity. Less than a fourth of the coal mined in the United States fails to enter interstate commerce either as railroad freight or locomotive fuel. Every one of the 45 coal-producing districts in the United States, except the Michigan district, ships coal outside the state in which it is mined, and the neighboring coal state, Indiana, ships coal to 17 states although itself receives coal from 17 mining districts in seven other states. Three hundred miles of cars loaded high with coal is the measure of the daily output of the bituminous mines of the United States and with that volume of traffic it is obvious that the uninterrupted flow of coal from mine to boiler room is a prime requisite to the general welfare.

With storage at the mine necessarily exceptional and at best limited in quantity, it is commonly true that without its daily supply of railroad cars the mine does

not start—thus closely is interstate commerce linked with coal mining. The daily rate of consumption is the proper unit of measure of bituminous coal, and so large is this daily requirement of the railroads and different industries, that in general it is impossible to accumulate stocks of coal sufficient to last as long as the stocks commonly carried of other raw materials. The two and three months' supplies of coal which the electric power stations and gas plants of the country now have on hand are exceptionally large and perhaps approach the practicable limit of stocks to be held in reserve simply as insurance against interruption of supply. Unfortunately, however, such stocks of coal are never evenly distributed among users, so that in fact a stoppage of either the mining or the carrying of coal would within a few weeks threaten large cities in every state with industrial disaster, and even a temporary interruption may cause serious embarrassment.

The present extensive and unrestrained interstate exchange of foodstuffs and other commodities, which has so lessened the danger of either local shortage or local monopoly, is itself conditioned upon an unfailing supply of coal, the very life blood of interstate commerce. The common carrier soon becomes unable to perform its full public service if its supply of fuel is even reduced, and a railroad without coal would at once cease to function, whatever its legal duty under a public grant. Continuity of operation of more than a quarter of the soft-coal mines of the country is demanded to keep the railroads themselves in operation; and the requirements of the public utilities would increase this quota to over a third. To that extent are coal mines directly essential to the operation of businesses that are universally recognized as clothed with a public interest.

If these businesses cannot be conducted without an ample and continuous supply of coal, obviously coal is affected with a public interest, arising from the clear and direct obligation to the public of continuous service not alone in the transportation of coal but in its production also, as there can be no transportation of coal without production of fuel—these two are inextricably bound together and constitute one agency of public service, for the coal is not mined until the railroad car for its transportation is set at the mine.

The public-welfare element in coal, then, is seen in the dependence of public health and safety on an unfailing supply of fuel, in the close connection between the prosperity of most industries and the uninterrupted operation of the coal mines, and in the obvious fact that without coal the great network of railroads which binds together this great country would be an idle, useless thing. It happens too that the railroads and the public utilities, themselves so clearly obligated to render whatever public service is demanded of them that the constitutionality of their public regulation is unquestioned, are of all industries most dependent upon coal. Thus, coal makes up over 35 per cent of the oper-

THE FUNCTION OF PUBLICITY

The first step toward the protection of the public interest in coal is a better understanding. The people will be able to exercise wisely their power over coal when guided by information rather than prejudice. The coal industry has profited immeasurably in the better knowledge it has obtained

of its own business while contributing to the investigations of the Commission. The government and the leaders of the coal industry both are blamable if the public has no proper conception of what coal means. The public needs information and the industry needs publicity.

ating cost at the gas plant and over 25 per cent at the electric power station, and in the operating expenses of a railroad the cost of coal is the largest single item, next to labor.

A failure of the gas and electric plants of a great city to function would result in a public catastrophe of almost inconceivable extent. This is one of the reasons that has put these utilities under public control, and the practical logic that half a century ago clothed with a public interest the steam locomotive and in later years the electric-power station must recognize a large element of public service in the coal mine that furnishes the necessary energy to both locomotive and power plant. It is this indispensable service which the coal mine performs that gives the large social value both to the property and to its product and in turn this social value in effect grants to the public an interest in that use and creates a compelling reason for public control.

The Commission is passing here upon an economic fact and not upon the law.

The Function of Publicity.—The first step toward protection of the public interest in the mining and marketing of coal as a continuous and efficient service is a better public understanding of the coal business. Guided by facts rather than rumors, by information rather than prejudice, the people will be able to exercise wisely the powers of the government over this type of private business to which society has given a larger value and special opportunity.

The extensive investigations by this Commission have necessarily put a heavy burden upon the industry. Yet in its response to these official inquiries, the coal industry has profited immeasurably in the better knowledge it has thus obtained of its own business. And this self-examination has not been limited to the inquiries initiated by the Commission, since supplementary investigations have been carried on by the coal associations, national and district, all of which have contributed to a truer understanding of the economic questions involved. If regarded not as arguments for or against any theory or system but as answers to current problems, as aids to suggested improvement in practice, and as the direct means of guiding the public in its relation to this great industry, this wealth of information will yield the best results.

The government and the leaders of the coal industry both are blamable if the public has no proper conception of what coal means to the country, what conditions and handicaps have to be met in the mining and distribution of coal, what economies can be effected, what advance is needed and what can be done in bettering working and living conditions. On all of these subjects the public needs information and the industry needs publicity. Those in the industry who have expressed their purpose to take the American people into their

confidence in the future by freely furnishing all the current information bearing on the relation of their business to the public interest surely can offer no objection to legislation providing specifically for that kind of publicity.

On the eve of the presentation of this report, the Bituminous Operators Special Committee appeared through its chairman, J. C. Brydon, and counsel, H. L. Stimson and G. H. Dorr, and submitted a plan for the collection and publicity of accounts on a voluntary basis. This plan represents such a substantial and gratifying development of opinion within the industry that the Commission heartily commends it to the favorable consideration of the agencies of the government through which it might be carried out. Pending the enactment by Congress of a law to provide for complete and compulsory publicity, this plan of voluntary reports would furnish much of the information required for the bituminous industry, and would thus bridge over the period between the close of the present Commission's investigation and the beginning of the permanent system of fact-finding and reporting recommended by it.

The Use of Federal Powers.—Both to protect the public and to promote the normal development of this great basic industry, the Commission recommends the use of the powers of the federal government over interstate commerce, recognizing that under our constitutional system a substantial part of the responsibility rests on the state and local governments and should remain there, and an even larger part on the industry itself and the public which it serves. The public includes investors in coal lands and properties, coal operators and miners, sales agents and retail dealers, as well as industrial and domestic consumers; and it is the aim of the Commission, in view of the facts presented in its reports, not only to protect the legitimate interests of the industry but to utilize to the fullest extent the good will and resources of the industry itself in putting to an end the disgraceful evils which have developed and which we have described.

Existing organizations in the industry—of operators, miners and dealers—furnish the natural point of departure for the reforms and improvements that are essential. When it became necessary to create a Federal Reserve system of banking, it was recognized that it could best be put into effect through the banking industry. The function of the government is that of supervision, with substantial powers of regulation. The same principle has been applied for a longer time to the railroads. This may be regarded as the characteristically American and constitutional method of dealing with such a national problem as is now presented in the coal industry. The Commission has aimed to make such proposals as will increase rather than decrease the sense of responsibility within the industry.

A legitimate pride in workmanship, in fair practice,

REGULATION BY THE INTERSTATE COMMERCE COMMISSION

The Coal Commission is opposed to new governmental agencies. It recommends that to the other responsibilities of the Interstate Commerce Commission the regulation of coal be added. The coal fact-finding services of the federal government must now be put on a permanent and well co-ordinated basis. The regulation of commerce in coal involves

the right to know the cost of its production, the investment in the business, the profits of owner, operator and dealer, and the earnings and working conditions of the miner. The logical and appropriate agency to exercise the administrative and quasi-judicial functions required for the coal industry are now in the Interstate Commerce Commission.

in operating and commercial enterprise will be developed not by taking over from an industry its own natural functions and placing them in the hands of the government but by such measures as will insure public knowledge and will create public confidence that abuses are in a fair way to be removed, and that service is constantly improving. This means drastic regulation when necessary as a last resort for those who will not voluntarily give the service on reasonable terms, but it means also a reasonable attitude on the part of the government and the public toward investors who risk their capital either in operating or in marketing, and toward miners who risk their lives in a laborious and hazardous occupation.

The government can act only through administrative agencies, and it is clear that if anything is to be done at all commensurate with the gravity of the problem an effective agency, with sufficient funds, experience and powers at its disposal, must be charged with the direct responsibility for such regulation and supervision as is necessary. Honest and efficient coal operators and dealers have nothing to fear from this. They have, on the contrary, reason to welcome it.

Administrative Agency Recommended.—The Commission is equally averse on the one hand to the unnecessary establishment of any new and unattached governmental agency and on the other to leaving this very necessary governmental responsibility to a haphazard collaboration of existing bureaus, whether in any one department or in several departments. We believe that the logical and appropriate agency to exercise the necessary administrative and quasi-judicial functions required for the coal industry already exists in the Interstate Commerce Commission. We recommend the creation for this purpose of a special division in that Commission.

The Congress of the United States is by the Constitution authorized to "regulate commerce among the several states." The railroads have already been declared to be interstate common carriers and to be within the regulatory power of the Congress exercised through lawful decrees of the Interstate Commerce Commission. The power to regulate involves the use of this means of transportation in the way that will best serve the interest of the several states of the Union. The regulation of commerce in coal among the several states involves the right to know the cost of its production, whether the investment on which a return is claimed is fairly estimated or inflated, and what profits are made by owner, operator, and dealer, and what are the earnings and working conditions of the miners.

Some of this information is already collected by existing bureaus. The Geological Survey in the Department of the Interior has made and is continuing the field examination of the coal reserves. Its geologists

have classified and valued the public coal lands in great detail and its statisticians compile annual and weekly figures on coal production and annual and seasonal statistics of coal consumption and commercial stocks on hand. The engineers charged with the investigation relating to water power are studying closely allied subjects, as for example, their extensive survey of the super-power project.

The Bureau of Mines, also in the Department of the Interior, is engaged in investigations in mining technology, mining safety, fuel economy, and it has had wide experience in coal sampling and analysis. Its relation to the coal lands is that of administering the government leases. Still other information concerning the industry and those who are engaged in it is collected by the Bureau of the Census in the Department of Commerce, and essential facts about sanitary conditions can be officially obtained when necessary by the Public Health Service in the Treasury Department.

The Fuel Administration of the war period and the present Coal Commission have obtained, as authorized by law, dependable and directly pertinent information concerning costs, sales realization, margins of profit, wage rates, earnings of miners—a wide range of engineering and economic facts which are essential to the kind and degree of self regulation under governmental supervision which we now recommend.

The Commission believes that this fact-finding service must now be put on a permanent and well co-ordinated basis. It believes that the moral influence exerted through publicity is an important if not the only necessary safeguard of the interest of the public.

Publicity as to the quality of coal in interstate commerce will greatly deter unscrupulous operators and dealers from the sale of "fireless" and other adulterated coals.

Publicity as to the costs and profits of the operators, transportation charges, the costs and profits of the wholesalers and retailers, will enable the consumer to judge whether a fair or an exorbitant price is being charged for his coal.

Publicity as to the earnings, living conditions and living costs of the miner will enable the public to form a judgment as to the equities of disputes between operators and miners over the renewal of wage agreements; and informed public opinion at such times will exert a deterrent influence upon the adoption of an unreasonable attitude by either or by both parties to the controversy and thus tend to prevent a lockout or a strike.

In times of prolonged suspension of mining, as in 1922, involving serious shortage of coal, the necessity of the most economical use of such coal as is available, and its equitable and efficient distribution after the resumption of operations, authoritative information will be of incalculable value in performing the func-

GOVERNMENT MUST GO BEYOND CONTINUOUS FACT FINDING AND PUBLICITY

The whole responsibility for the administrative correction of abuses—the regulative function—must be concentrated in one place. The fundamental evil in the anthracite industry is monopoly—treatment of limited natural resources as if they were like other private property. A graded tax on royalties

and differential profits is the one remedy found short of price fixing or public ownership. Limitation of margins to a reasonable return on legitimate investments and the elimination of monopoly profits are perfectly reasonable demands of the public. The Pennsylvania sales tax raises the price of anthracite.

tions which the Federal and State Fuel Distributors have been attempting to perform, although with inadequate authority and facilities. In times of emergency the proposed division of the Interstate Commerce Commission would be ready to act as Federal Fuel Distributor and subject to the direction of the President of the United States, the agency to deal with transportation and distribution as the emergency requires.

Co-ordination of Fact Finding and Regulation.—

There should be some organic relation between the Interstate Commerce Commission, in the exercise of its regulatory powers over the coal industry, and the Geological Survey and other bureaus which already have experience and facilities for collecting any part of the information needed. The Interstate Commerce Commission itself should, however, create any necessary facilities for continuing the collection of current information which does not more appropriately and naturally come from these existing sources.

Fact finding and interpretation of the facts would thus, with mutual advantage, be separated to this extent from executive action based on the facts. The Geological Survey, for example, might continue to gather systematically, publish currently, and interpret the facts about production, reserves, storage, etc., and could furnish special information within its field when called upon by the Interstate Commerce Commission to do so. The Bureau of Mines might have the whole responsibility of safety, investigations, and for any necessary federal inspection of quality, etc. Investigation of labor disputes (not compulsory arbitration) might belong to any governmental agency which is charged with similar responsibilities in other industries.

The whole responsibility for the administrative correction of abuses, the regulative function, must be concentrated in one place. Our proposal is that this should be a special division of the Interstate Commerce Commission. The collection of information about finances, operating costs, etc., not having been undertaken heretofore by any other permanent agency would naturally belong to the Interstate Commerce Commission itself, and that body should have power to secure all needed information either from the original sources or from such bureaus as collect it.

All these facts change from season to season, and vary from district to district, and from mine to mine; and the public is entitled to know them. This Commission does not advocate publicity about private affairs, but it holds that the transportation of coal in interstate commerce is so affected with a public use and that coal enters so intimately into all the necessities and conveniences of modern life that there is no longer any private right to secrecy as to such matters as costs, profits, wage rates, and working and living conditions.

Supervision and Regulation.—The government must go beyond continuous fact finding and publicity, important and elementary as these functions are.

The fundamental evil in the anthracite industry is that of monopoly—the treatment of limited natural resources as if they were like other private property. Reliance on competition without supervision has resulted in persistence of a permanent level of high prices above which extortionate increases were made whenever a suspension of mining or other disturbances give rise to the phenomenon of premium coal.

In the anthracite industry, we have secured stability—which is desirable—but it has been at high cost to the consumer and has made anthracite a luxury fuel. The public is just now concerned as to whether the increase of 10 per cent in the wages of anthracite miners is to be “absorbed” by operators, carriers, and dealers, or passed on to consumers, just as it was outraged by the abnormally high prices of last winter. But as shown in the report on anthracite, underneath these exceptional surface fluctuations there is a rising flood of costs and of prices which does not recede with the fall in the prices of commodities in general and which does not yield to such measures, entirely justifiable and desirable for other reasons, as the separation of mining from the railroads.

The special report on anthracite discloses that there are such inequalities in the wages of miners as to require a thorough revision of the entire wage scale, some miners obtaining wages much higher than are paid in other comparable occupations, while others fall far short of what is needed to furnish a living in accordance with American standards. It discloses that, together with these relatively low wages and unsatisfactory living conditions of many of the miners, including those who derive least benefit from the recent 10-per-cent increase in wages, there are excessive royalties and differential profits. Limitation of margins to a reasonable return on legitimate investment and the elimination of monopoly profits, whether in the form of royalties, operators’ and dealers’ margins or freight rates, are perfectly reasonable demands of the public.

One remedy, short of price fixing or public ownership, remains in the hands of the government for the protection of the public interest. This is the levy of a graded tax on royalties and differential profits. This would not lower the price of coal but it would secure a public revenue without increasing the price of coal. The present sales tax imposed by the State of Pennsylvania on anthracite gives no such protection, even though it yields some \$7,000,000 to the state. Since it is a percentage on the f.o.b. mine price, it falls on the marginal high-cost producer, as on others, and even more heavily when he is selling at a higher price, and is therefore passed on to the consumer in the form of still higher prices.

GENERAL RECOMMENDATIONS

The main purpose of the federal regulation recommended would be stabilization of the industry and protection of the public. Any incidental advantages should be sought only gradually and as experience shows this to be feasible. The general recommendations are addressed to the government,

the industry and the consuming public. The Congress of the United States has the right to determine under what conditions the products of the mines may pass in interstate commerce over the railways. Greater use of river transportation for coal is urged.

An excess-profits tax, as suggested above, under these monopolistic conditions, would not be added to the price of coal, and thus would not be passed along to the consumer, as it would fall only on those who have differential advantages. Thus, the federal taxes in the 5-year period 1917-21, studied by the Commission, were lenient to the low-profit operator and bore more heavily on the high-profit operator, the range being from 2c. a ton on a non-dividend paying company to 28c. on one of the most profitable companies.

The main remedy, however, against extortionate prices lies in the consumer himself. There are substitutes for hard coal and a readiness to resort to them is the ultimate and effective defense against an unreasonable price.

The mining and marketing of soft coal is the larger and, from the point of view of the national economic life, the more important industry, and here the fundamental evil is overdevelopment, irregularity of operation and consequent enforced idleness of miners and of invested capital. This problem, like that of anthracite, can be solved only by the federal government, in co-operation with the industry, working on a national scale and with a clearly defined national policy. It is through the granting and withholding of transportation service through supervision that an equilibrium can be established between demand and output.

The Interstate Commerce Commission under the existing law already has the responsibility for authorizing a railroad to put in sidings and to furnish cars and transportation. The information collected as above proposed should be utilized as a basis for determining whether at a given point and at a given time the public convenience and necessity do or do not demand further coal supplies. Instead of diverting to high-cost "snow-bird" mines, and away from well-developed and normally functioning mines, a part of the limited and sorely needed car supply and motive power at the moment when scarcity and high prices make mining profitable, the better policy will ordinarily be to concentrate the car supply at the places where it can be used to best advantage, but the still better policy is to secure such regularity of production and storage as to prevent scarcity and high prices. With a steadily increasing demand, encouragement could and would be given to the normal opening of new mines on a permanent rather than temporary basis.

Already there is positive control of the distribution of bituminous coal among the markets inherent in the freight rates, a regulation under the jurisdiction of the Interstate Commerce Commission. The freight-rate differential may in fact exceed the difference in mine costs, so that the rate largely determines both the market and the market price. To this extent there already exists a type of regulation of coal through the regulation of interstate commerce which has a direct effect on prices.

The most convenient and practicable of the various possible methods of exercising the right of control over the interstate commerce in coal would appear to be the licensing of all who desire to ship coal from one state to another or to buy and sell in interstate commerce, whether as operators, wholesalers or jobbers. Reasonable conditions, logically growing out of the inherent power of the government, and implied in its exercise, would naturally be attached to the granting of the license and violation of them would be cause for suspending or revoking.

The main purpose of the federal regulation here recommended would be the stabilization of the industry and the protection of the public interest. Any incidental advantages, however desirable in themselves, should be sought only gradually and as experience shows them to be feasible.

The Commission's findings of fact and its conclusions based thereon are given in detail in the score or more separate reports. The specific recommendations already made deal with all phases of the problem of coal, but these in part are here restated and broadly grouped as they are addressed to the three parties in interest: First, the general public in its governing capacity, whether represented by Congress or other legislative bodies; second, the coal industry itself—operators, mine workers and retail and wholesale dealers; and third, the great body of coal consumers—railroads, public utilities, other industries, and the millions of citizens who buy coal.

Governmental Action.—First among the Commission's recommendations is that Congress make definite provision on a permanent basis for continuing the collection of coal facts both to instruct public opinion and to guide the administrative correction of abuses. Because of the intimate interrelation of coal mining and transportation, the Interstate Commerce Commission is the logical agency to exercise whatever regulatory powers over the coal industry are necessary to the public interest. The Coal Commission has found the facts, and the Congress of the United States in its opinion has the right to determine under what conditions the products of those mines may pass in interstate commerce over the railways of America.

Throughout its investigation this Commission has constantly found points of intimate contact between interstate-commerce regulation and the coal business. Greater use of river transportation would help to get more coal to market with less coal cars. The river movement of coal, considerable at one time, has been discouraged, if not stifled, by artificial rail rates. The long-continued policy of waterway improvements financed by the national government has been ineffective in operation through unfair competition on the part of the railroads, which can now be directly controlled in

REGULATION OF COAL THROUGH TRANSPORTATION

Economy in the use of transportation demands that the long haul of coal be no longer encouraged by favoring rates established without adequate regard to cost and service rendered. If all coal were alike, zoning of the whole country might be desirable. A reversal of the tendency to promote overdevelopment by widening markets with low rates is

called for. Railroads are urged to base mine ratings on commercial factor as an incentive to off-season movement of coal. There is neither constitutional nor economic warrant for the federal government undertaking the distribution of coal in the several communities of the country. Consolidations in soft coal would be an advantage.

accordance with the policy, expressed in the Transportation Act, "to promote, encourage and develop water transportation service and facilities in connection with the commerce of the United States." The use of these powers recently granted to the Interstate Commerce Commission deserves serious consideration.

Economy in the use of transportation also demands that the long haul of coal be no longer encouraged by favoring rates, established without adequate regard to the cost of the transportation service rendered. Thus, much of the soft coal that is now produced and consumed in this country is transported undue distances, in many instances on its way to market passing across other fields producing coal of similar character. If coal were coal so that it could be used for every and any purpose, instead of different kinds being required for special purposes, the zoning of the whole area of this country might be desirable, prohibiting the transportation of any coal beyond its natural market. But without adopting any artificial zoning of coal shipments, such as during the war served the double purpose of saving transportation and controlling distribution, there can be a reversal of the tendency to promote overdevelopment caused by widening the marketing territory through reduction of freight rates relative to those of older and competing fields.

Gradually and without undue violence to established conditions, the rates should be readjusted to re-establish more natural relations between the elements of cost and service which will make for economic zoning. The result will be a reduction in the total cost of transportation to the nation. This proposal is apparently in line with recent decisions of the Interstate Commerce Commission.

With coal the railroad's largest item of freight, and mine capacity far exceeding railroad capacity, the best use of the available car supply and motive power at times becomes a nation-wide problem. Along with the obvious economy in supplying each market with the coal nearest to it, is the need of furnishing an economic incentive for regular off-season purchase and storage of bituminous coal, thus increasing the length of the average working year for both miner and mine, and so reducing costs of production and prices to the consumer.

The most promising method of attaining this end is by giving a controlling influence to the commercial factor in the distribution of railroad cars to coal mines in times of transportation shortage. By this change in practice first consideration would be given to the commercial ability of the producer to sell coal rather than to mere ability to produce and load it into railroad cars. While the primary duty to determine a just and reasonable rating lies with the railroad which distributes the cars, the method of rating here suggested involves a principle of sufficient concern to justify investigation of the entire subject by the Interstate

Commerce Commission on its own motion. Removal of the peak load which the coal mines impose upon the railroads is a task in which the government needs to co-operate with the industry in seeking possible relief from irregular operation and overdevelopment.

As administrator of the public estate which includes 50,000,000 acres of coal lands in the public-land states, the federal government, however, has a direct responsibility in restraining overdevelopment, which exists in the West as well as in the East. The leasing law should be amended to give the Secretary of the Interior full discretion to make his approval of the opening of a new coal mine on the public domain contingent on the showing before the Interstate Commerce Commission that such a mine would serve the public and not involve a needless investment and excessive cost.

In its educational relation to both the general public and the coal industry the government occupies a well-defined field of endeavor. We therefore recommend that the Congress designate an agency to unite with the industry in continuing studies of unemployment as an effect of irregular operation, of the wage structure, serving as the medium of publicity for rate information in the non-union fields as well as of all other basic facts on which industrial relations depend. With continuous investigation of this type the government agency is best prepared to make under authority of the President the special compulsory investigation whenever the prospect of failure to renew an agreement is imminent, and with continuous publicity of this type the people will be best prepared to focus upon the negotiators the irresistible moral pressure implicit in their joint obligation to furnish the public with coal.

In all the investigative work relating to mining the federal government has properly taken the lead. It is true economy for such studies that concern a score or more of states to be prosecuted under federal auspices, but the co-operation needs to go further. To reduce the hazards in coal mining, state and federal governments must co-operate in inspection, revision of mining codes, supervision of compensation insurance and in safety education.

For the betterment of operating methods and working conditions, state inspection must be freed from politics; also, the codes of some states badly need revision, and in this the Federal Bureau of Mines can render special service, since unification is essential to remove unfair competition based on the different operating costs under the widely varying safety standards in neighboring states. The federal government is in a position to contribute to the education of the industry since the Bureau of Mines has gone far in its investigation of every element of mine safety—operating methods, explosives and equipment. What is imperative is rigid enforcement of regulation based on present knowledge.

We look forward to the working out under federal supervision of a national policy commensurate with the importance of the coal industry. This would include not only a natural limitation of marketing area by the adjustment of freight rates to express the true relation of cost to service, with a voluntary division of territory on economic lines, but also the consolidation of mining companies. The consolidation, grouping or pooling of bituminous-mining operations should be not only permitted but encouraged, with a view to securing more steady production, less speculative prices, a wider use of long-term contracts with consumers, better living conditions, more regular employment and lower costs. The existing legal barriers to such an economic arrangement should be removed, retaining, however, the necessary protection to the public interest, by requiring supervision of the financial structure of the consolidation, as is prescribed in the Transportation Act for railroad consolidation.

Consolidations may be utilized to combine low- and high-cost mines, keeping the latter in reserve for periods of emergency and limiting current operation when the demand is normal to low-cost mines. The bituminous industry may thus be brought from its overdeveloped, unorganized and chaotic condition to one more nearly like that of the anthracite industry, which formerly suffered from similar unstable conditions. This would be done, however, under governmental supervision and therefore without the incidental anti-social policies which have created the special problems in the anthracite industry elsewhere discussed.

The economic urgency of encouraging larger units of production is indicated by the fact that the daily output of the average mine is only four cars, which involves a wasteful dilution of transportation service. The railroads justly complain of the extra gathering service required to serve so large a number of small and scattered mines, a service in marked contrast to that given a single mine in Kentucky which in a single day loaded six trains, or 256 gondolas. The opening of so many small mines in recent years has been a contributing factor in the transportation shortage.

There is neither constitutional nor economic warrant for the federal government undertaking the distribution of coal in the several communities of the country. Democracy must pay the price, and one of the prices exacted of it is that the citizens of a community shall look after their own welfare and discharge their own duties. Therefore, it is the function of each community by licensing retail coal dealers, by organizing co-operative associations, by establishing municipal fuel yards, or in whatsoever other ways they may see fit, to take the necessary steps that after the coal reaches the railroad siding the distribution thereof is made to the consumer upon a fair and equitable profit to the distributing agency, whatever it may be.

Action by the Industry.—The Commission realizes that the largest opportunity and the largest responsibility for putting the coal industry in order lies with the industry itself. Self-determination is the ideal.

The coal industry, like other industries, but with exceptional clearness, reveals two distinct and contrasting tendencies in management. There is one that is animated by a purely acquisitive and exploiting spirit that has no other apparent end in view than to make money for the owners. Quick to make the most of any panic among buyers, of any opportunity to pyramid

sales, to sell adulterated coal, or to cut the wages of miners, this type of operator and dealer resents public interference or public knowledge of his business. He is rightly called a profiteer and the public instinct which demands that he be exposed and curbed and ultimately forced out of business is sound. But besides profiteering, there is also in the coal industry, as in other industries which exploit natural resources or other differential advantages, a less conspicuous but equally unjustifiable element in the cost to the consumer.

A substantial part of the amount paid in royalties and in excess profits represents a return to owners of wealth who perform therefore no useful social service and who take no part in production. This form of ownership does not increase efficiency or economy or conservation. It does not contribute to the mining of coal or to making it cheaper. There is no way in which this first deduction from the value of the product can be forcibly prevented, as far as this Commission is aware, except through government ownership, which we believe to be both undesirable and impracticable, or by taxation on the excess profits and royalties, which we recommend, although with no expectation that it will be completely effective as a remedy. Not through governmental coercion but through the enlightened self-interest of producers and consumers, the real remedy is to be sought. The coal industry can reform itself from within.

Management for effective service to the public, rather than exclusively for profit, is the second of the tendencies mentioned and the Commission is convinced that this tendency is clearly in the ascendant; that operators are increasingly coming to realize their duty as citizens and their enlightened self-interest in establishing such a spirit of co-operation as will promote the prosperity of the industry with direct benefit to the public.

To pay fair wages, to remove the causes for the sullen hostility which prevails to an astonishing extent among workers, adding a larger and unnecessary element to the cost of coal, to make mining a safer occupation even if this means slowing down production, to sell at a reasonable price that will bring a fair return to investors with steady operation of the mines, to establish a reputation for clean and well-prepared fuel, to standardize fair practices in contracts between seller and buyer, to lay out and develop the mines in such a way as to conserve and economize the coal and to bring it to the market at the least expense, to come through clean as an industry capable of solving its own problems, with a minimum of governmental supervision—all this is already clearly in the minds of many operators, miners and dealers.

This Commission, after an exhaustive examination of the evidence collected by its own agents and submitted by all interested parties, has greater confidence in such internal organization and such educational work as will promote these remedies than in any which it is within the power of the Congress or legislatures to apply, essential as we believe some legislation to be.

A number of the Commission's studies falling broadly under the head of engineering can be summarized by saying that in the intelligent initial planning of coal mines and their proper management under engineering control will be found the requisites of conservation of the resource, of safety for both men and mine, and of efficient and profitable operation. The best managed mine has the minimum of friction with its employees.

SOCIAL UPLIFT AND BETTER LABOR RELATIONS

The mine worker and operator are urged to work together for mine safety and to co-operate in the betterment of conditions outside of the mine. Training of foremen in management and the centering of responsibility in labor relations are urged. The United Mine Workers is a necessary institution for the protection of the standards of working

and living conditions that have been attained. The Commission does not believe that the public will sympathize with the efforts of the union to organize the non-union field unless the union recognizes that public interest is superior to its monopolistic control and it finds some other way than the "exercise of economic force" for adjusting its controversies.

What engineers can do for the industry is shown in the larger and newer mines, well laid out and equipped with modern machinery. Good engineering, which includes the wise management of men as well as the handling of material, can work out reforms underground far more important than much that is apparent at the surface. To these tasks, the industry should invite the best technically trained men and thus raise the standards of the operating side of coal mining.

We urge upon the industry a fuller appreciation of the common interest of mine worker and operator in most of the problems that the industry faces. In the all-important matter of mine safety, for instance, miners and operators should join forces. The responsibility of the management to equip and operate the mine with every safety precaution must be matched by individual responsibility by every foreman and worker. Through miners' organizations and safety committees, with regular meetings of officials and workers, much can be done by joint action to protect their common interest.

Part-time operation, which causes increased costs to the operator—thus a three-day week compared with a six-day week means a 25 per cent increase in the ton cost of the coal mined—at the same time cuts in half the miners' earnings. This common interest in continuous and successful operation finds a concrete expression in the present British wage agreement, which provides that miners and owners share the profits of the business in the defined proportions, the profits being figured not on a single mine but on the whole district. The plan is equitable and would probably have won even more enthusiastic support in a more prosperous period than the past two years have been in the British coal trade, and after a longer trial this form of adjusting wages to results may prove to bring about the highly desirable full co-operation of employer and employee in seeking efficiency.

Another opportunity for co-operative effort is in the betterment of conditions outside the mine. Living conditions cannot be standardized either in company towns or where miners own or rent their homes independently of employers, but they can be greatly improved. Water should be more generally brought into the houses to save work for housewives and to encourage cleanliness. Bath houses at the mines should be required in all states. There should be more good roads. Sewers should be provided where the expense is not prohibitive and far better sanitary arrangements where sewers are impracticable. Mining camps and towns are not rural in any proper sense even when they are small.

Fresh milk and fresh vegetables should form a larger part of the ordinary diet of the miner's family. The dirty one-cow dairy should be inspected and cleaned up or abolished. Education in the elementary principles of diet, the choice and preparation of foods is sorely

needed. Facilities for healthy outdoor recreation should be very greatly increased. Schools should be improved. Many companies have given attention to this, supplementing the local public resources for education; nevertheless many mining communities do not furnish the amount or kind of elementary education which the public opinion of all our states demands for future citizens.

When all has been said the mining camps and towns are in too many cases dreary and depressing places in which to live. They need not be, as the well-planned and well-maintained camps of successful and progressive operators have abundantly shown, even in the face of difficult topographical conditions. If there were more community spirit and community planning they could be made not only livable but cheerful. Even a short-lived community is likely to last through a generation and some of the worst conditions are in fields having an expectancy of 100 years.

Experience has demonstrated that homes need not be chucked helter skelter together against the tippie and railroad tracks. The community can be laid out attractively with protected lawns and gardens, often with ample space between dwellings, with convenient buildings for common use, and, what is of the greatest importance, with good roads for communication with the outside world. The responsibility is not all on the employer even when he is also the landlord. The miners will have better living conditions when they demand them and do their part in getting them.

In their labor relations, common interest should lead both operators and the miners, through their organizations, to study the problem of unemployment and together seek to stabilize the industry; to study by joint committees the whole rate structure and its relations to the different jobs in the mines; and to perfect the machinery for settling disputes through conciliation or voluntary arbitration, with the adoption in the non-union fields of adequate checks on the exercise of the right to discharge.

On the part of the operators we recommend that more attention be paid to the problem of labor adjustment. The success of many companies in establishing good relations warrants special attention to the training of foremen in management and to the centering of responsibility in labor relations. The operators also need more effective organization for labor relations and we recommend district and national labor commissioners, men of the highest type, who can work out a national labor policy. If the Sherman Anti-Trust law prevents the operators from combining together for the purpose of collective bargaining with the miners, which the Commission does not believe is the case, then Congress should exempt them from the operation of the law for that purpose.

While complete autonomy for the widely separated

districts may be impracticable, we suggest that the two parties in collective bargaining should work out a system of national negotiation with district agreements, which will avoid standard-cutting wars between districts and secure adequate flexibility to meet necessary district conditions.

There are valid objections to the check-off, especially in the collection of fines and assessments, and it has also injurious effect upon the union in divorcing the problem of income from the winning of membership, and in the resulting lack of closeness of contact and of educational service and control by the higher officers to the lower officers, and to the rank and file members of the union; yet the check-off is not vital enough to justify a suspension of operations, whether the union is seeking to extend its use or the operators seeking to throw it out.

The history of the past 30 years affords conclusive evidence that the United Mine Workers of America has been the potent agency in the betterment of the miners' working and living conditions, and it is necessary today for the protection of the standards that have been attained. However, unless the union accepts in practice the principle that the public interest is superior to that of any monopolistic group, whether employers or employees, and gives satisfactory guarantees of a fair and orderly adjustment of controversies in other ways than by the exercise of economic force, the public will not view with sympathy the efforts of the union to extend itself over the whole field of the industry.

Action by the Consumer.—Coal is mined to be used as fuel, and the consumer pays his share of all the extra costs due to any poor functioning of the industry. However, upon the consumer can be placed some responsibility for excessive costs, and the cure for existing bad conditions is partly in his hands. Therefore the Commission addresses some of its recommendations to consumers of coal, large and small.

The immediate cause of high and exorbitant prices of soft coal is a demand from buyers far in excess of the supply. There is no evidence of any combination or monopoly among producers and shippers of bituminous coal, now or at any time, sufficient to control production or prices. As has been repeatedly shown in these reports, the peak demand for coal involves a peak demand for coal transportation too acute to be adequately met by the railroads, except by an unwarranted expansion of rail equipment and facilities. The removal of the peak therefore appears to be the direct remedy, and the consumer can contribute to the removal of the ups and downs of the coal business by buying for regular delivery and balancing seasonal variations in consumption by storage.

Storage of coal by consumers is the balance wheel between fluctuating consumption and variable production. Regular, systematic, large-scale storage of bituminous coal, then, is the public's largest opportunity in helping to solve the coal problem, and the consumer's responsibility may be said to be proportionate to his annual requirements. It is especially gratifying, therefore, that the railroads, the public utilities, the iron and steel industry, and other large users of bituminous coal in the United States have undertaken storage on a large scale. The definite adoption of this policy by the larger railroads and public utilities is plainly in the public interest and never before has the outlook been more promising for the continuation

and extension of this direct method of stabilizing coal production. We commend, also, the present activity of the Federated American Engineering Societies in promoting the storage of coal by practical investigation and popular education.

Another way open to the consumer in aid of more regular mine operation and steadier market is the purchase of coal on contract. In this, producer and consumer can co-operate, and the unusual shifting about by producers for markets and by consumers for tonnage in the past six years has been both effect and cause: The effect of war and strike conditions and the cause of further disturbance of the coal trade. To aid in stabilization, however, the tonnage contract for coal must be more than an option. Coal shippers and coal consumers must become impressed with the idea that a contract means a fixed obligation with respect to both delivery and acceptance of tonnage and that no shipper with contract commitments should enter the spot market until he has fully discharged his contract obligations, or buyer shut off contract shipments while he purchases lower priced spot coal.

Better utilization of coal by the consumer is a field not investigated by this Commission. No report on the coal industry would be complete, however, without reference to the saving in cost of energy and heat that can be effected by more general appreciation on the part of the consumer of the losses and waste for which he is responsible.

Plainly no one can logically complain of wasteful production of coal when his own consumption of coal is even more wasteful. Nor can the consumer justly complain of high prices for coal when he throws away so large a part of the heat units in the coal he buys. Thrift in the use of coal is especially to be commended to the larger consumers, and fortunately it is at the steel plants, byproduct coke plants, and central power stations that the best practice prevails. Last year the electric power stations of the country generated from coal 25 per cent more kilowatt-hours than in 1919, but in doing this burned nearly a million tons less coal—that is fuel economy on a national scale. The super-power project which plans the installation of only the largest power plants would effect even greater savings in the consumption of coal as well as in the transmission of electricity.

These great possibilities in the more efficient and wider use of coal emphasizes the importance of every measure for conserving this most valuable resource which will more and more serve as the nation's dependable source of power. The other substitute fuels, gas and oil, deservedly popular as they are, must be regarded as of passing interest as compared with coal. Indeed, the relative temporary nature of our oil resources should lead us to give priority to the higher uses of the petroleum products and abandon the fuel use of oil. The world has not oil enough to burn under either stationary or locomotive boilers, nor even in household heaters for any period beyond the present time of surplus production.

The field of the fuel engineer is largely unoccupied. The average consumer to whom coal is coal needs technical advice in selecting the coal best suited to his need and in using the coal so selected. Scientific and engineering facts on fuel economy lie within his reach but are mostly unutilized. A few dollars spent for coal information can save hundreds of dollars expended for coal.

That Coal Industry Should Reform from Within Seen As Salient Point of Commission's Final Report

Official Washington Impressed with Counsel of Self-Government Under Federal Supervision — Sees Disappointment in Recommendations to Proponents of Drastic Settlement of Coal Problems in One Swoop

BY PAUL WOOTON

Washington Correspondent of *Coal Age*

"Self-regulation under governmental supervision" are five words which give a comprehensive idea of the scope of the final report of the U. S. Coal Commission. Throughout the report emphasis is put on the conviction that the industry can reform itself from within. While some legislation will be required to carry out the suggestions of the Commission, the remedies proposed are largely non-legislative in character.

Monopoly is cited as the fundamental evil in the anthracite industry. While no hope is held out for material reductions in anthracite price, the Commission believes that wholesome results will follow the imposition of a graduated tax on royalties and differential profits.

Overdevelopment, irregularity of operation, and consequent enforced idleness of miners and of invested capital constitute the Commission's opinion as to the chief evils in the bituminous industry. Very definite control over these evils can be exercised by the Interstate Commerce Commission, under existing law. The Commission points out. The Interstate Commerce Commission already has the power, the Coal Commission believes, to withhold transportation facilities from mines in the public interest. By concentrating car supply at places where it can be used to best advantage, during emergencies, the best interests of the country could be served. In that way regularity of production and storage can be obtained. It is in the carrying out of this plan that the licensing of operators and wholesalers is suggested.

NO CURB ON UNION'S LEGAL RIGHTS SUGGESTED

To one type of mind the report certainly will be a disappointment. To another type of mind it will appeal as the longest stride which has been made in effecting greater stability in the most important of the basic industries. To those who believe in drastic efforts to settle great questions once and for all with one whack, the Commission's report will appeal as having settled none of the fundamental causes of instability. A powerful labor union remains with no suggestion that its legal rights be diminished. No suggestion is made for the apprehension and punishment of profiteers. There is no hint of nationalization. The curtain goes down with the same persons on the stage who were there at the beginning. The presentation was not a tragedy. No one of the actors has been killed off. Nothing in the Commission's report singles out the villain.

There is another type of mind to which the report will appeal strongly,—those who doubt if things ever are settled once and for all, to stay put forever after. They recognize that progress cannot be made any faster than the people involved can progress themselves. Reports of Commissions do not, overnight, make over the thought of millions. All recognize that no government

ever will be able to carry through drastic changes in industrial policies just because some agency is given dictatorial powers. This second type of mind will see in the report an instrument capable of effecting wholesome and far-reaching results.

The Commission has come to the conclusion that the prospect of obtaining adequate coal supplies at reasonable prices lies within the industry itself. They place the responsibility on the industry. The participation of the federal government is limited to observation—because that is all publicity of accounts amounts to. There is government intervention only when the ordinary machinery fails to function.

The purpose of the commission is to have the government concentrate its attention on efforts to encourage the constructive and public-spirited units within the industry rather than spend its time chasing profiteers or trying to convict someone of shipping dirty coal. By strengthening the hand of the decent element which comprise the overwhelming majority of those engaged in the coal industry the profiteer will be eliminated automatically.

PLEA FOR GOOD WILL OF CONSUMERS

The report is not an indictment of employers or of employees. It rather is a plea for good-will and better understanding between them and for better understanding on the part of the consumers. It brings home that the industry is quite as dependent on the public as the public is dependent on it.

Some of the important things which the Commission wants the industry to do are the revision of some of its distribution and transportation practices; more use of engineering talent; better methods of conducting employer-employee business affairs; better forms of wage contracts and better contracts for the sale of coal. Action by the industry itself along such lines is where the Commission pins its hope rather than on the exercise of compulsion from a Washington bureau.

The Commission believes that the industry will not suffer in the slightest degree by abandoning secrecy. If it is to act in large groups, facts which concern the consumer and the transportation agencies must be known. The compulsory setting forth of accounts and the rendition of certain reports is a necessary step in the policy, the Commission believes, to promote better relations between the public and the industry and between employer and employee. The report makes it clear that the whole object is to carry forward the policy of strengthening those in the industry who are forward-looking and public-spirited.

The reason why the making of these returns is made compulsory is because the Commission demonstrated to its own satisfaction that there always would be a few who would not play the game honestly, which made

compulsion necessary to insure fairness to all. At first some of the members of the Commission opposed the idea. It long has been a tradition in the Geological Survey that more information could be obtained without compulsory powers than with them. The Commission came to the conclusion rather reluctantly, however, that it will be necessary to require these reports if the government is to be able to guarantee figures to the public.

The theme of the report is the same which ran through the Commission's anthracite findings. It is that coal is affected with the public interest. The Commission's interpretation of the expression is not that the public has the right to clamp down regulations on the business of coal but that it is a business in which the producer and the consumer are so jointly and mutually and profoundly concerned that they must take common counsel.

One cannot help but be impressed with the different conceptions emanating from this Commission than was prevalent fifteen years ago when trust-busting was regarded as the panacea for most of the country's economic ills. Here is a Commission that hints plainly that the Sherman law has gone too far. It recommends division of territory, consolidation of mining companies, and priority of facilities, in time of emergency, to those in a position to produce most effectively. With those suggestion, however, goes the recommendation that the financing of these consolidations is to be supervised as the Transportation Act provides for financial supervision in the matter of railroad consolidation.

It is certain that the report will not be entirely satisfactory to the Chamber of Commerce of the United States or to the United Mine Workers of America, but those who have had an opportunity to read the Commission's summary of its findings are almost unanimous in the opinion that a monumental piece of work has been done in a remarkably short period of time and with a minimum of funds.

Effect of Pennsylvania Tax on Anthracite Prices Shown in Commission Statement

By way of amplifying its remarks on anthracite prices in its final report, the United States Coal Commission on Sept. 22 issued for simultaneous publication the following statement:

"The price of anthracite coal is directly affected by the state tax of Pennsylvania of 1½ per cent producing a revenue to that state of from seven to eight million dollars a year, which necessarily is borne by the anthracite consumers of the country. The higher the price to the consumer the greater the return to the state. The greater the cost of production entailed by the high price to the consumer, the larger the cash return for distribution within the state, and at the expense of the anthracite consumers.

"This tax is confined to anthracite, the mining of which is practically exclusive to that state, and the monopolistic feature of which is recognized by the policy of that state in taxing anthracite only while its bituminous coal in competition with the great bituminous fields in the country, remains untaxed. In addition to this, the laws of that state are extreme in the precaution taken to prevent workers from the outside entering the anthracite fields of that state, confining the opportunity to work practically to those now engaged in

that field by a licensing system that requires two years' service as an anthracite mine helper before being permitted to enter regular mining operations.

"All this makes for higher prices of anthracite to the consumer. The situation as far as relief is concerned is complicated by the fact that the anthracite supply is a monopoly to one state, while those who consume are practically scattered the country over. Constantly bounding prices inevitably tend to drive the consumer to other forms of fuel, the price of which is controlled by competitive conditions that do not control in the one state monopoly of anthracite."

AN EXECUTIVE ORDER has been issued by the President providing that the records, files and property of the U. S. Coal Commission be transferred to the Department of the Interior. The Secretary of the Interior is designated as the custodian of the files and the Director of the U. S. Geological Survey is designated to perform the administrative duties incident to the closing of the work of the Commission.

Commissioners Pay Tribute to Hammond

Before the adjourning of their final session, the members of the U. S. Coal Commission paid tribute to John Hays Hammond, their chairman, as follows:

"If the records of the U. S. Coal Commission shall be preserved in permanent form, the members thereof will not be content with the record unless there remains the statement that if it has failed in accomplishing its purpose, such failure in no wise can be attributed to its chairman, the Hon. John Hays Hammond; and if it has succeeded, a large measure of that success is justly due to the wisdom, prudence and foresight with which the chairman has presided over its deliberations and guided its investigations.

"There are two grades of presiding officers; one, who leaves the impression upon the members of the body that cool, calm, calculating and deliberative justice has been the measure of his service; the other is one that back of the conscientious discharge of duty there has pulsed the warm and unfailing heart of friendship—a friendship which has touched the dead body of duty and brought to its cheek life and the flush of pleasure. To this latter class our chairman belongs. We part from the attempt to discharge our duty with pleasure that the work is over; we grasp his hand in farewell with regret. Long may he live to be an honor to his country and a delight to his friends."

BEFORE DISBANDING on Sept. 22, the members of the U. S. Coal Commission called at the White House to inform the President formally that they had completed their task. Following the conference Chairman Hammond said: "The President paid a special compliment to the Commission's technical staff, saying that he believes that no more capable, public-spirited and unselfish body of workers ever had been recruited for government service."

AFTER ELEVEN MONTHS' SERVICE with the U. S. Coal Commission, Dr. George Otis Smith, by executive order, was reappointed director of the U. S. Geological Survey. The reappointment became effective Sept. 24. The Coal Commission expired by statutory limitation on Sept. 22. Thus, for one day, after twenty-seven years of continuous public service, Dr. Smith was without official responsibility. P. S. Smith, acting director in Dr. Smith's absence, has resumed his duties as administrative geologist of the Survey.

WHEN THE U. S. COAL COMMISSION went out of existence at midnight Sept. 21 it still had an unexpended balance of between \$20,000 and \$25,000 of the \$600,000 fund appropriated for it by Congress. This will automatically be turned back into the United States Treasury.

*Address of John Brydon
To American Mining Congress*

Curb Labor Monopoly and Other Coal Problems Will Solve Themselves

President of National Coal Association, Speaking Sept. 26 at Milwaukee, Attributes Most of Soft-Coal Industry's Difficulties to Nation-Wide Strikes and Obstructive Tactics of Miners' Union

I have been asked to speak on "Some Problems of Coal." There is only one problem of coal—at least, only one major problem—from the standpoint of the public. That problem is the problem of labor relations. It is my firm belief that all the other problems of the coal industry—engineering problems, marketing problems, transportation problems—are minor ones; are ones which will solve themselves, so far as they affect the public, if the major problem of the industry, that of labor, is squarely met and dealt with. It is the violent conflict in labor relations that alone prevents the public from obtaining the protection and benefits that would otherwise uniformly flow to it from the highly competitive nature of the bituminous-coal business.

For the past year I have been chairman of the Bituminous Operators' Special Committee, which has been representing the bituminous coal producers of the United States before the U. S. Coal Commission. This committee has conducted extensive and exhaustive researches into the various aspects of the coal industry. It has supplemented that practical knowledge of the facts of the industry which is possessed by every well-informed coal man with a wealth of statistical and other information which affords a sound basis for definite conclusions as to the industry. When I say to you that the one major problem of the coal industry is the problem of labor—more specifically, that it is the problem of the labor monopoly of the United Mine Workers of America—I say it not only on the basis of my own personal experience in the coal industry but also on the basis of the material which has been collected by my Committee during the past year and which has been presented to the Coal Commission.

Solution of Main Problem Would Settle All.—What are some of these problems which have commonly been considered the major problems of the coal industry? There has recently been the problem of chaotic and unstable price conditions. There is the problem of the increase in coal prices since the pre-war period. There is the problem of irregular operation. There is the problem of car supply and transportation. There is the problem of the overmanning of the industry. There are various engineering problems involved in securing more efficient production. These are only a few of the problems of the industry, although they have generally been considered among its major ones. And yet I believe I can show to you that in every case, if that central problem were solved, the others would solve themselves.

First let us consider the problem of prices of coal.

The history of bituminous-coal prices during the last ten years has two principal features: One is the wild and unprecedented fluctuations in price which began in 1916 and have only now subsided; the other is the very appreciable amount by which the now stabilized prices of coal exceed the prices of the pre-war period.

It is not necessary to go into detail as to the first of these features. Every one of you is familiar with the sharp rise in coal prices during the war, and with the runaway market which was checked only after the establishment of the U. S. Fuel Administration. You are familiar with how the strike of the United Mine Workers organization in 1919 came at a time to prevent any stabilization following the war. You are familiar with the situation in 1920, where the highest spot market in history resulted from United Mine Workers strikes in the Central Competitive Field in violation of the agreement to accept the award of the Bituminous Commission, and from the tie-up in transportation due to the switchmen's strike. You are familiar with the partial stabilization of the industry during the depression of 1921, and, finally, you are familiar with the national strike of the United Mine Workers organization in 1922, and with its results. You know that during this period from 1916 to 1922, spot prices of bituminous coal have varied in a way they never varied before the war. As the investigations made by the Bituminous Operators' Special Committee show, the spot-price variation from 1906 to 1915 was only 31 per cent on the 1915 basis, while from 1916 to 1922 it was 849 per cent on the same basis.

Price Fluctuations Due to Labor Troubles.—The thing to which I wish to call your attention is the fact that, with the exception of those conditions which were a result of the great war, a cause which we do not now have to reckon with, all of these wild price fluctuations have been the result of labor trouble either in the coal industry or on the railroads. In 1919 it was a nation-wide coal strike; in 1920 strikes in violation of contracts all over the Central Competitive Field in the effort to secure higher wages for daymen, combined with the switchmen's strike; in 1922 it was a nation-wide coal strike, combined with the railroad shopmen's strike. In each case a strike caused an abnormal shortage, a buyers' panic, a runaway market, and resultant charges of "profiteering." The moral to the public is obvious: Prevent nation-wide strikes in the coal and transportation industries, and runaway markets will be a thing of the past.

The bituminous-coal industry is a highly competitive one. Bituminous coal is produced in thirty states.

There are over 6,000 producing companies, scattered from Pennsylvania to Washington, and from Alabama to New Mexico. Data recently submitted to the Coal Commission show that these companies have over 200,000 stockholders. If the stockholders of companies owning coal-producing subsidiaries be included then there are over 360,000 stockholders interested in producing coal. There are thousands of bondholders in addition. The largest company produces less than 3 per cent of the supply.

There has never been and there is today not the remotest possibility of monopoly of capital in the soft-coal industry. As someone has said, "In the bituminous-coal industry, geology has enforced the Sherman Act." There are enormous undeveloped coal reserves. Under these circumstances, supply always potentially equals or exceeds demand, and hence competition may be relied on to prevent high prices. It is only when the competitive processes are reversed by nation-wide strikes in the mines or on the railroads that a runaway market occasioned by competition of buyers is possible. Stop nation-wide strikes, and you prevent runaway markets.

The second marked feature of the history of prices during the last ten years is the fact that normal competitive prices of coal, even in a buyers' market, have practically doubled. On Sept. 1, 1915, at a time of stabilized prices, the *Coal Age* average of spot prices of bituminous coal was \$1.10. At the present time, in a similar time of stabilized prices, the *Coal Age* average is \$2.38. In other words, the normal price of coal has more than doubled.

Why is this? First, it is to be borne in mind that the Federal Fuel Distributor has for months been reporting that the price of coal in district after district has fallen to or below the cost of production for a substantial amount of the necessary supply. Second, it is elementary economics, which I simply wish to recall to the minds of you gentlemen, that in a freely competitive market the price of a commodity is determined by the cost of production of that substantial portion of the supply which is necessary to fill the demand, and that the price in the long run tends to lower itself to the level of the cost of production in the lower cost units. Hence, any increase in any element of cost means an inevitable increase in price. What element of cost is it that has increased and so has been responsible for the price increase we have been discussing, in spite of the drastic operation of competitive laws?

Labor Represents 68 Per Cent of Production Cost.—The chief element in the cost of producing coal is labor. It approximates 68 per cent of the total cost of production, and it is this element of cost which has increased most markedly since the pre-war period. A part of this increase in labor cost is undoubtedly legitimate. The coal operators of the United States do not wish the wages of their men to fall below the normal competitive standard of wages, nor do they wish wages to lag behind any increase in the cost of living.

Neither of these things has been true in the coal industry. On the other hand, wages of bituminous-coal miners have remained on an abnormal and inflated level. They are 182 per cent higher than in 1913. The cost of living is only 69.5 per cent higher. The wages of all other unskilled labor have fallen with the cost of living since the war; the wages of coal miners have not fallen. Their wages are now higher than those of every

other variety of unskilled labor, and they are even higher than those of almost every class of skilled labor.

These statements are not mere assertions. They are the result of careful statistical study by the economists employed by the Bituminous Operators' Special Committee. That study showed that average daily earnings of bituminous miners in the Hocking Field—the base for the union wage scale—in 1922 were \$8.83, while the average for all unskilled labor in twenty-three manufacturing industries was \$3.35, and that for all skilled labor in those industries, was \$4.73. In other words, bituminous miners in 1922 made 163 per cent more than the average unskilled laborer and 86 per cent more than the average skilled worker in the manufacturing industries of the country.

Why is this? Because while labor in other industries is competitive, labor in the bituminous-coal industry is largely a monopoly. The monopolistic organization of the United Mine Workers of America holds under its central control so large a proportion of the coal miners of the country that it is able to sustain an inflated wage scale, and thus keep the cost of coal much higher than it normally should be when considered in relation to other basic commodities. The price of all commodities has advanced 59 per cent since 1913; the price of coal has advanced 97 per cent.

The seriousness of this condition is not generally realized. The panicky markets of 1919, 1920 and 1922 caused much public fear and discomfort, but the abnormal increase in the cost of coal, due to the monopolistic position of the miners' union, has resulted and will result to an increasing extent in the throwing out of adjustment of the economic machinery of the country, just as it is always thrown out of adjustment by any successful attempt to monopolize labor or capital in a basic industry.

Here, then, is our first problem of the coal industry, that of the increase, permanent or temporary, in the price of coal, and it analyzes down to the problem of labor, and, specifically, to the problem of the labor monopoly now maintained by the United Mine Workers.

Causes of Car Shortage.—Let us consider a second problem, a basic problem of the coal industry, the problem of transportation. We all know that the railroads of the country are sometimes overtaxed, and we know that this overtaxing of the transportation facilities has affected the bituminous-coal industry particularly. Car shortage has caused many a sleepless night to many bituminous producers and to their consumers as well. Why do car shortages occur? A detailed study, made by the investigators for the Bituminous Operators' Special Committee, has shown to us beyond all doubt that general serious transportation shortage in peace time is in every case the result of nation-wide labor disturbances in the coal or in the railroad industries.

The two great car shortages from which the country has suffered occurred in the winter and spring of 1920, following the 1919 coal strike and simultaneous with the strikes in the Central Competitive Field, and in the fall and winter of 1922, following the coal strike of that year. It is true that a certain amount of transportation trouble is due to seasonal fluctuation in demand, but the serious trouble is caused by a situation like that in 1922, where the railroads had to haul a year's supply of bituminous coal for the United States in seven months. They did not do it. They could not do it, and

it would be foolish for us to insist that they be put in a position where they could do it, as it would necessitate greatly increased investment and therefore increased rates.

Here again what is apparently one of the major problems of the coal industry resolves itself into a mere aspect of the central problem, that of labor, and, more specifically, that of the nation-wide strike.

Improvement of Mining Methods Obstructed.—Let us take another problem of the coal industry, that of efficient mining. For years engineers and operators have been co-operating in an effort to get out more coal for less money in an effort to increase production per man, by the use of machinery and by improved mining methods. The effort has not been as successful as it might have been. Why? Because of the deliberate policy of limitation of output which has been practiced and enforced in the union fields by the United Mine Workers of America.

Studies made by the experts in the Bituminous Operators' Special Committee show that the efficiency of labor in identical mines in the Kanawha field was 113 per cent greater under non-union than under union operation, due to freedom from union practices limiting output. In the Logan field, under non-union operation, the average production per man per year over a 16-year period was 1,236 tons; in the every way similar Kanawha field, under union operation, it was 819 tons, a difference of 51 per cent in favor of non-union operation. Yet under non-union operation production per man per year in Kanawha went to 1,466.8 tons, or even higher than in Logan. These figures show beyond all doubt the handicap placed upon operators and miners alike in the fields contracting with the United Mine Workers organization by practices fostered and compelled by that organization.

The uneconomic practices of the United Mine Workers' organization are of various kinds: Strikes in violation of contract; opposition to the introduction of labor-saving machinery; limitation on the number of cars a man can load per day; restrictions on working time; limitations on the number of men who may load after a machine; voluntary absenteeism; interference with management and curtailment of the right of discharge; rigid classification of work; and many others, including unduly high wage rates for operation of labor-saving machinery.

Here again the problem comes down to the problem of labor, for if engineering advances cannot be put into practical operation on account of labor opposition, they are of no value.

Traces Cause of Overdevelopment.—Another of the problems of the coal industry is that of overdevelopment, too many mines and too many miners. The inflated prices which have existed at times during the last seven years have brought into being many mines which should never have been opened. There is an overdevelopment in the bituminous industry; but this overdevelopment may be traced back through the intermediate cause of inflated prices to the ultimate cause of nation-wide strikes or the fear of nation-wide strikes in the coal and railroad industries; in other words, back to the problem of labor. Similarly, the problem of the overmanning of the bituminous-coal industry may be traced back.

The United States Coal Commission has told us there

are 200,000 too many bituminous miners. Yet how can it be otherwise in an industry with an inflated wage scale which enables men by working two-thirds of the time to make much more than laborers in other industries who work full time? And, as I have already said, this inflated wage scale is the result of labor monopoly by the miners' union.

Finally, there is the problem of irregularity of operation, long one of the most discussed problems of the bituminous-coal industry. What is the analysis here? Where you have overdevelopment, irregular operation is inevitable until the normal processes of competition have forced out the superfluous units. In the bituminous-coal industry the ordinary processes of competition have never had a chance to force out the superfluous units, because the competitive processes have again and again been interrupted by national strikes. Prevent national strikes for a period of ten years, and irregularity of operation, except in so far as some slight irregularity is made necessary on account of seasonal variations in demand, will be a thing of the past.

I have called your attention to a number of the problems of the coal industry, and have shown you that in every case the real problem was that of labor—that in most cases it was that of the present policies and practices of the United Mine Workers of America. Subject to qualification in so far as the labor troubles have been on the railroads, I believe this statement to be a true one, that all evil hardships which the public have sustained in getting and paying for bituminous coal may be laid at the door of the monopolistic policies of the International organization of the United Mine Workers of America in Indianapolis, and the use of the nation-wide strike as a weapon to secure its ends.

Wage Earner and Farmer Most Affected.—Who are "the public" who are thus affected? It is perhaps the broadest public in America. It is every manufacturer who uses coal, every consumer who purchases manufactured goods or uses domestic fuel. Numerically "the public" is overwhelmingly wage earner and farmer. It is on them that the burdens of industrial dislocation and inequality fall most quickly and most heavily. It is the unskilled laborer with his \$3.35 average daily earnings, the skilled workman with his \$4.73 average daily earnings who in fact pay the unskilled miner his average daily earnings of \$8.83.

In this situation, in which this public ultimately pays the piper, in what direction does its interest lie? First, would it be in the public interest for the operators who do not now contract with the organization of the United Mine Workers to do so? The attitude of the operators of those fields as expressed to the U. S. Coal Commission is that so long as the organization of the United Mine Workers continues its present policies and methods they are firmly resolved not to contract with that organization. They propose to continue to mine coal employing independent mine workers. Is this in the public interest? That is for the public to form its own opinion, but it seems to us to be essential to the public interest to keep these fields free of monopoly control. Suppose that all operations in all fields did contract with the centralized organization of the United Mine Workers. Nothing would then stand between the public and further enormous increases in the cost of coal through wage increases. So long as the competition of the non-union fields continues there is some limit to the power of the labor monopoly to dictate its terms.

Effect of Non-Union Competition.—Further, it is this competition that supplies a motive to the operators who contract with the United Mine Workers to stand out against cost and therefore price-increasing wage demands. Once all operators contracted with the organization of the United Mine Workers, this pressure of competition among themselves being relieved and wage advances affecting all alike, all motive on the part of the operators to resist unreasonable demands would for practical purposes disappear. So long as all were affected alike by the increased costs, there would be an inevitable tendency to pass them along to the consumer rather than themselves to undergo the loss and hardship of a strike. Competition in any substantial degree from coal produced in other countries, or substitute fuels, is remote and would furnish no protection against enormous added burdens to the public.

To meet the evils of the present situation, which result from the fact that the present power of the organization approaches that of monopoly, it is clear that complete labor monopoly is not the remedy. The operators in the independent fields are in effect fighting in the interest of the public, and should receive its support.

It would be idle to claim for them that they are fighting this fight solely or chiefly because of its effect on the public interest. A prime consideration that moves them is that if complete monopoly were established, it would be within the power of the president of the United Mine Workers' organization and his policy committee, through their control of wage differentials, to make or break any set of operators in any district. It is well for the public to remember the words of President Harding during the 1922 strike: "The simple but significant truth was revealed that, except for such coal as comes from districts worked by the unorganized miners, the country is at the mercy of the United Mine Workers."

If complete labor monopoly is not the way out, is the destruction of the United Mine Workers' organization the objective to be sought in the interest of the public? There is not, has not been, and at present there appears to be no prospect of any campaign by the operators in the bituminous industry for the destruction of the United Mine Workers' organization. The Bituminous Operators' Special Committee, composed in equal proportions of operators who contract and operators who do not contract with the United Mine Workers' organization, squarely took the position before the U. S. Coal Commission that the problem was not one requiring the destruction of that organization, but the acceptance by that body of standards of responsibility and methods of dealing and contracting which are already in successful use among the more progressive labor unions of the country.

Combinations Limit Freedom of Action.—The Committee urged as fundamental upon the Commission this proposition: That if capital or labor by combination create an artificial power to deal with labor relations, such artificial power carries with it definite limitations. Individuals, if they desire to combine, cannot have their cake and eat it too. If they desire the power which artificial combination gives, they have got to lay aside a certain freedom of action which the community could otherwise safely let them exercise. It does not affect the public when small numbers of employees use the strike as a weapon to secure wage increases and refuse to accept impartial arbitration. But where,

through the artificial power obtained by nation-wide combination, the weapon of the strike is used to tie up the nation's industries, then it becomes a very different story. The use of such a nation-wide strike to enforce demands becomes intolerable and the acceptance of the principle of voluntary arbitration where employers and employees cannot reach an agreement becomes inevitable.

The Bituminous Operators' Special Committee made definite suggestions to the U. S. Coal Commission as to changes in methods of contracting which would eliminate the recurring crises occasioned by the periodic termination of wage agreements and would provide for the responsible living up to agreements. In this it was merely following proposals which have from time to time been put forward by the operators contracting with the United Mine Workers' organization, notably the proposals drafted by them in December, 1922, and submitted to the United Mine Workers as a basis for the negotiation of new wage-scale agreements. These proposals definitely provided a plan under which there should be no interruption of mining by strike or lockout pending negotiations in the various districts for wage agreements. They further provide that in the event of such negotiations failing, the matters at issue should be submitted to voluntary impartial arbitration which should be binding upon both sides. The adoption of such a system last winter would have been an enormous step toward safeguarding the interests of the public and solving what, as I have said, is the one great problem, from the public's standpoint, in the coal industry.

Favors Voluntary Arbitration of Differences.—Instead the public is faced with the termination of United Mine Worker contracts in the bituminous fields next April 1. It has just been through the experience on relatively small scale in the anthracite fields, with results to the public which you gentlemen can appraise for yourselves. The operators who contract with the United Mine Workers of America have not yet outlined their policy to meet the critical situation which will presently come upon the country, and it is not my province to forecast their action. But from the standpoint of the public there is one clear principle which it seems to me must sooner or later receive recognition: If the artificial power of combination in labor relations is to continue to be permitted, it must recognize that this very power carries with it certain limitations; that one of those limitations is that it shall not beat the public over the head with the bludgeon of a nation-wide strike; that one of those limitations is that it must in the event of failure to agree by negotiation be willing to submit differences of opinion to voluntary impartial arbitration. There must be a system of contractual relationship in which responsibility for observance of contracts will be enforced and recurring crises in the industrial life of the nation eliminated.

If this problem is to be solved, if the interest of the public is to be served, you cannot expect to have the operators bear the whole brunt of fighting this battle. If you accept my analysis of the situation, then in this matter your interest as members of the public and that of the operators coincides. It is for the public to bear a hand and to make sure that the representatives of the public in official position do not befog or run away from the issue, but meet it squarely and vigorously.

National Strikes an Extravagant and Unfortunate Method of Settling Disputes

Nationalization Might Be Dangerous Venture—Temporary Seizure Hazardous—Continuous Investigation and Publicity on Industrial Relations Warranted—Might Resort to Mediation at Instance of President

Mutterings are already heard of a soft-coal strike next April. Here is the only direct statement of the Coal Commission on national strikes. The remedy offered is continuous investigation and publicity to force the inherent statesmanship among operators and miners to agree without strikes. Mediation is suggested as a last resort. This is a section of the Report on Labor Relations.

For reasons in part set forth in the section on The Unit of Negotiation, it is believed that the public interest will be better subserved by having practically all the agreements in the unionized part of the bituminous industry expire at the same time. This, it must be recognized, opens the possibility for a general cessation of operations in that part of the bituminous industry which is organized. The people of the United States suffer more seriously from a national strike in the coal industry than from any of the outlaw strikes that happen within the agreement period, or from the irritations and annoyances of both sides which are more or less continuous, and they seldom if ever recoup their losses.

Consumers, smarting under the acute fuel shortages of the last few years, too easily take on the impression that the men mining coal prefer to strike. Resentment at being bothered, moreover, makes it wholly comfortable to hold this opinion. Investigation shows, as common sense would of course infer, that this is not a true picture. A general tie-up of the coal industry by hundreds of thousands of adult men in the trade is always a serious matter never to be lightly undertaken. Furthermore, any man who has had experience attempting to get consistent uniformity of action out of an organization scattered over the whole country, knows that some force of cohesion must exist to make the nation-wide unionization of miners possible.

In spite of all these conditions within the union which tend to reduce the danger that a national strike will become habitual and will occur, they do occur, and the loss to the country as a whole may be far greater than the loss to either operators or men. Indeed, conditions are easily imagined under which operators and union might both welcome a temporary cessation of work. There was considerable suspicion that a condition approaching collusion obtained in some territories in connection with the strike of 1922. Certain it is that interruption of production might easily make possible the marketing of a given supply of coal at a higher price than would obtain if no such interruption occurred, and it is entirely conceivable that under those conditions the interruption would not greatly reduce the total amount of employment or the total production of coal during the year in which it occurred.

Whatever the circumstances under which a general strike occurs, it is at best an extravagant and unfortunate method of settling disputes. Fuel, whether we use it to heat homes or to run factories is a vital public necessity. The requirement that a dependable flow of this commodity shall at all times be available and the seriousness of any interruption of that flow, has led people of widely differing views to join in a well-nigh unanimous demand that some protection against what is universally regarded as a national disaster shall be found.

Certain citizens in seeking a remedy advocate the nationalization of mines, the result of which they believe would lead automatically to placing the full power of the Government behind their operations at all times. Others believe that Government should compel some form of compulsory arbitration and outlawry of strikes. Approaching the question from opposite angles, these two are perhaps the

most extreme remedies that have been suggested. With respect to anthracite, the Commission has already recommended giving the executive branch of the government power to operate the coal mines temporarily in an emergency.

Following is a list of the preventive measures that at one time or another have been proposed to forestall the dangers of a national strike.

Nationalization of the mines. Seizure and national operation of the mines in emergencies. Compulsory arbitration with compulsory acceptance of the award. Compulsory arbitration without any further compulsion upon the acceptance of the award than is offered by public opinion created by its publication. Compulsory investigation of the causes of disputes without the proposal of any award. Continuous investigation of labor relations in normal times as well as after disputes developed. Timely and discriminating publicity. Report to the President of the United States and subsequent mediation.

Nationalization.—In spite of active agitation carried on in some quarters looking toward early nationalization of coal mining, we do not believe the country is ready for any such hazardous venture in public administration. In so far as nationalization is offered as a remedy for national strikes, it would be effective only to the extent that national administration could remove the conditions out of which the strike develops. We find no basis for the belief that it could do this more effectively than private administration brought up to the best standards of present day industrial and union practice. Until the present management of the mines and of the union has shown clearly that it is incapable of bringing its administration up to these standards, a policy of government ownership would involve the addition of grave problems of administration without any evidence that certain grave problems of the present would be ameliorated.

To the extent to which national administration failed to remedy the "conditions which tend to create strikes," the only guarantee it could give against their actual occurrence would be the guarantee of superior force—the guarantee of a government strong enough to command men to work and make them do it. We do not believe this kind of coercion would constitute a progressive American way of meeting a difficulty. Public administration of bituminous mining at present, therefore, appears to offer no solution to the difficulties under discussion.

Seizure.—As regards temporary seizure it must be recognized that the obvious hazards of such a measure, however much it might be justified as applied to the more or less localized anthracite mines, would develop palpable impossibilities if attempts were made to bring the whole bituminous industry within the purview of such a drastic emergency procedure. The most that could possibly be undertaken would be to operate enough mines to prevent a coal famine. The situation in the industry to-day does not make it likely that any such drastic or dubious venture will have to be seriously contemplated.

Compulsory Arbitration.—A Joint Conciliation Board, an Umpire and resort to adjustment machinery under one form or another is accepted practice in coal mining. It is perhaps not easy to understand why, if an Umpire or Joint Conciliation Board can adjust differences during an agreement, it cannot equally adjust the differences necessary to making an agreement. When, however, we direct our attention to the political field, we find that throughout our history as a nation, we have been willing to have courts interpret our laws, while at the same time we have been insistent that the making of those laws should be left to balanced representative bodies. Compulsory arbitration is an attempt to set up judge-made law, and as such, is essentially unsound. There is no logical parallel between arbitrators, umpires and conciliation boards functioning as interpreters of the law under an agreement that constitutes the fundamental law of an industry, accepted by both parties, and arbitrators placed in the position of dictators of such law. Moreover, it is entirely logical that one or both parties to negotiations may in an emergency consent to refer to an arbitrator or board, specific questions such as wages which their negotiations have been powerless to resolve and yet, at the same time, be entirely unwilling to put themselves in the position in which they are powerless to decline the service of such a board.

There is still deeper reason than the logical desire to have their representatives influential in determining basic conditions why workers should object to compulsory arbitration. Circumstances did not make it easy for workers to unite in efforts to redress their grievances. Many obstacles had to be overcome before the miners of the United States and Canada were brought together into one organization. In the beginning, the unifying force was an almost universal recognition of severe oppression. This bond, together with the bond of fellow-craftsmanship, realization that others in the same occupation were experiencing the same difficulties as themselves, was the influence that brought them together. Having joined their interests, whether in small groups or in nation-wide areas, they found that the one effective weapon by which, when other means failed they could secure attention to what they considered their just demands was the right collectively to quit work. After once discovering the effectiveness of this weapon, it is but natural that the habit of its use should grow.

Especially is this true as long as there is lacking a competing bond which tends to dissolve the bond of common suffering. The lack in many cases of any sense of leadership on the part of mine management, repeated attempts to "put one over" on the men, victories which may at times be deserved but which are so won as to cost dearly in ill-will, irritation of mean and short-sighted management—all these conditions make striking easy and peace hard, and give rise to the view that the only defense against the meanness of the boss is to be meaner yet. Much of the strength of the union and its readiness to strike, of its difficulty in being fair, of its lack in cool, constructive leadership, is attributable to that philosophy of management which however much it may prate to the contrary, and talk of common interests, has unconsciously perhaps been based on the belief that the conflict of employer and employee is necessary and eternal, and that the nature of mankind has little of importance in it beyond its economic motivation.

The militant literature of the two sides to which we have taken occasion to address ourselves in another section gives ample proof of the mutual attitude of conflict which is far too much in the foreground in the coal mining industry. In these circumstances, taking away from miners the right to strike can scarcely make for peace and a continuous dependable supply of coal. The fact that workers have taken a leaf from the book of management and have themselves in many instances become aggressive and truculent, does no mean that it will be either just or expedient for the public to attempt forcibly to make them remain at work. It is impossible to make men work against their will, and the public should recognize it in planning its own policies. Even if there were promise that an effort in this direction would ultimately meet with formal acquiescence on the part of workers—which is extremely doubtful—it would not result in real peace or efficiency in the industry. Compul-

sory arbitration, even though it should by chance bridge over some serious conflicts, would give rise to the almost overwhelming difficulties of obtaining by force effective service from men who do not want to work or effective management from men who do not want to operate.

Compulsory Arbitration with Optional Acceptance of Award.—Compulsory arbitration without compulsory acceptance of the award escapes these difficulties. However, by issuing an actual award worked out by persons not directly in the industry it sacrifices its best chances to effect a true settlement by joint agreement. It is not so much the actual terms upon which two sides get together as it is the mutual working out of the terms which should tend toward a true acceptance of an agreement and toward enduring peace. It, however, may frequently in certain circumstances be a useful form of mediating tactics, even though it would be inexpedient to use such a plan in every case still less to make it compulsory.

Compulsory Investigation.—Compulsory investigation is the method embodied in the Canadian Industrial Disputes Act, which has perhaps had the most successful experience of any. The drawbacks, however, of any investigation which must start after disputes have taken form and the emotions of conflict have been aroused, are very considerable. Facts which might have been effective in preventing a strike, had they been effectively marshalled before a conflict had reached an advanced stage, may even serve to develop greater heat if brought to bear when a conflict is far advanced.

Continuous Investigation.—The dependence of the country upon a steady supply of fuel is so great as to warrant an attempt to overcome this handicap by providing that investigation of industrial relations and of the basic facts upon which industrial relations depend shall be continuous. Such continuous investigation should not be thought of as principally critical. Wisely administered, it would not be so much concerned with noting cases of bad practice as with noting those of the opposite sort. It should, however, be on the alert in discovering facts and conditions which if not corrected might result in conflict. An efficient agency for continuous investigation would tend to bring about such an exchange of information within management as to stimulate constantly improving practice and it would make the union more heedful than it now is of the public responsibilities that attach to its position of achieved power.

Timely and Discriminating Publicity.—In order to be effective, however, continuous investigation would have to be accompanied by timely and discriminating publicity. The question as to what type of report concerning conditions in the various fields upon which labor relations depend, would be most advantageous, is a subject to which a permanent coal commission would need to give careful attention. Another subject in regard to reports, to which it would need to address itself would be the quality—to what extent should they be regular and periodic and to what extent special reports should be made, either upon subjects which, if not taken in hand, might lead to strikes, or upon conditions which furnish occasion for special commendation.

Progress in the improvement of management and the effectiveness of agencies which management might employ to bring about better labor relationships would need to be periodically reported. Likewise, public notice should be made of the progress of the union in maintaining discipline and securing the full adherence of locals and individual members to the terms of the agreement, and in meeting their responsibilities under the agreement. It would be helpful, also, to have publicly noted, the progress of the national organization in rendering special service to the district and local organizations, and in promoting and supporting activities for the general education of members, not only in their responsibilities under the agreement, but in other matters intended to promote the progress of miners as citizens and as a functioning part of their industry.

It would, of course, be equally essential to keep the public

informed as to the work of adjustment machinery, including the extent to which differences are settled between the parties, the speed in making adjustments and in general, the efficiency of the joint administration.

These are suggestions concerning the kind of publicity which if it occurred in the natural course of events and not merely as an emergency measure to prevent a conflict, should have a tremendous restraining influence upon those whose activities would make for a general strike or escape from a general strike.

Report to the President of the United States Followed by Mediation.—If with such continuous investigation and publicity as has just been described, a disagreement should still be carried to the point of threatening an early cessation of work, we think that a special report of the situation should be made to the President of the United States. To this end it is suggested that all agreements between operators and union should contain a clause which would provide for automatic renewal of all agreements except in regard to such provisions as one party or another may have given notice to the other ninety days in advance of the date of termination of the agreement. In case of failure to agree, a report, setting forth the factors at issue, should be made by each side to the President not later than 60 days before the expiration of the agreement. It is recommended that when such a report is made, the President immediately designate a person or persons whose duty it shall be to inquire into the factors at issue and make a report and award thereon to the President on or before the date of expiration of the agreement. Such an award would be made public or not as the President would deem wise in the particular circumstances. It should be the purpose of such a report to focus upon the negotiators the irresistible moral pressure implicit in their joint obligation to furnish the public with coal.

We are confident that with a continuous orderly process of investigation and report, and if advisable with the timely injection of a definite representative of the public into the situation in case of disagreement, it will become very much more difficult for either side to adhere in any captious way to a contention that will precipitate a tie-up of the industry.

As earlier set forth, the best approach to a remedy for the evils of the general strike will not, in our judgment, be found in an immediate resort to drastic prohibitory measures. Whatever artificial gap may have developed between employer and employee—they must work together or there can be no peace and no real efficiency. The weight of opinion among operators and union officials alike is that they themselves desire to fix the fundamental terms, upon which the industry shall operate. The most thoughtful and best advised among them express great confidence of their ability to do this in an orderly way. From our survey of the statesmanship that exists in the industry, it is believed that the operators and the union are equal to this task, if once they recognize the finality of the public insistence on continuous operation and address themselves single-mindedly to bring that object to pass. It will be necessary, however, for them to find means of bringing their best statesmanship to the front in connection with the general negotiations. They cannot perform this indispensable public duty unless they emancipate themselves from the atmosphere of truculent militancy that too often characterizes their proceedings.

The Commission believes that the combination of continuous investigation and publicity with the possible resort to mediation at the instance of the President of the United States, will remove the necessity for more drastic emergency measures. The process here outlined should have a sobering influence that will make strongly for enforcing responsibility to the public among representatives of both the operators and the union. Until measures for holding both sides to their responsibilities have been exhausted, it will be unwise for the public to embark on more far-reaching measures of regulation of labor relations.

The above suggestions are intended to encourage mutual accommodation and agreement at the time of the renewal of negotiation and thus to lessen the chances of national strikes or suspensions. The fundamentally constructive

opportunity however lies in the building up of the day-to-day relations within the agreement period. Improvement in industrial relations during the life of the agreement would very considerably lessen the probability of a national strike.

One-Third of Soft Coal Lost in Mining, Says Commission

Report on Waste in Production Cites Improper Methods and Carelessness as Prolific Causes of Avoidable Losses

More than a third of the soft coal is left behind and lost in mining, according to the conclusions contained in a summary report of the U. S. Coal Commission on "Waste in Mining," published Sept. 20. The complete report includes a full description of the fields visited in each state with the details of the field investigation, as well as 53 illustrations and 20 tables, and will be published by the Bureau of Mines.

The engineers making the examination and study included Carl A. Allen, of the Bureau of Mines, whose valued contribution was cut short by his death as a result of pneumonia contracted while in the field after completing the work in several states; James D. Sisler, of the Pennsylvania Survey; J. J. Forbes, the Bureau of Mines district engineer in the South, and F. E. Cash, another mining engineer of the Bureau. Messrs. Rice and Paul, of the Bureau of Mines, co-operated with Mr. Leshner, of the Commission's staff, in planning and conducting this extremely painstaking and successful study.

"The principal causes of losses," says the summary, "were found to be coal left on the roof and bottom, coal lost in room, entry and panel pillars, coal lost in oil and gas-well pillars, coal lost under buildings, railroads and boundaries, coal lost in handling and preparation—underground and surface—coal lost by rolls, thin or dirty areas, and streams. The losses of coal in undeveloped beds overlying beds that are first extracted is not treated at length in this report since each particular case would involve detailed engineering study and it is believed that with proper methods of mining loss from this cause should not be large.

"The coal lost in mining based upon the production of coal in 1921, is summarized in the table which follows:

SUMMARY OF COAL LOSSES IN STATES INVESTIGATED

State	Production in 1921 in Thousands of Tons	Loss of Coal, Per Cent			Loss of Coal, Thousands of Tons		
		Total	Avoidable	Unavoidable	Total	Avoidable	Unavoidable
Alabama.....	12,600	32.9	18.0	14.9	6,150	3,370	2,780
Illinois.....	69,600	49.0	29.7	19.3	66,900	40,550	26,350
Indiana.....	20,300	42.2	26.7	15.5	15,800	10,000	5,800
Kentucky.....	31,600	30.7	11.8	18.9	14,000	5,380	8,620
Maryland.....	1,827	30.7	12.7	18.0	808	328	480
Ohio.....	31,900	40.0	26.0	14.0	21,300	13,740	7,560
Pennsylvania.....	116,000	28.6	15.5	13.1	46,400	25,100	21,300
Tennessee.....	4,400	24.7	13.2	11.5	1,440	770	670
Virginia.....	7,500	20.0	5.0	15.0	1,870	467	1,403
West Virginia.....	72,800	22.8	10.5	12.3	21,500	9,900	11,600
Totals and Averages....	368,527	34.7	19.4	15.3	196,168	109,605	86,563

"Among the causes responsible for avoidable losses are listed the following:

- (1) Improper methods of mining.
- (2) Carelessness or bad engineering in carrying out those methods.
- (3) Careless cleaning of the coal in the mines or at the tipple above ground.
- (4) Excessive blasting blowing small coal and larger pieces into the goaves or gobs.
- (5) Poor methods of transportation, such as loading pit cars high above the sides so that the coal rolls off or is knocked off in transit, and is ground under foot; also the use of cars with large cracks or poor doors so that the fine coal sifts out, and this also being ground into dust increases the danger of coal-dust explosions.
- (6) (a) Leaving pillars either to keep the surface intact, where back-filling methods might be employed.
- (b) Leaving boundary pillars, especially panel and entry pillars.
- (c) Leaving pillars to protect oil and gas wells which might be taken care of by other means.
- (d) Coal used for ballasting track in the working places.
- (e) The irregularity of the workings without "sight," which leads to coal being left behind.

"A number of the field reports mention the fact that many mines are not laid out according to good engineering methods, and entries and rooms are not driven on 'sights.' Also, too many rooms are turned off butt headings in order to increase production of coal when the market is active. When workings are not opened by survey, the whole mine becomes very irregular (as is shown by some of the plans in this report), the cost of mining increases, and the recovery of coal is lower than it should be. In times of slack demand, these excess number of rooms are allowed to stand idle, the roof caves, and frequently large areas are abandoned because these falls cost too much to remove. Creeps and squeezes are induced by driving too many rooms, especially when the pillars are left too narrow.

"The greatest loss in mining is in room, entry, and panel pillars, this varying from 5 to 45 per cent. But of this loss, from 3 to 36 per cent is avoidable, therefore here is a problem requiring considerable study.

"It is not always wise to attempt to mine too much coal in the advance, and generally, from 50 to 60 per cent should be left for the retreat. This necessitates calculating the width of rooms and pillars to allow of such a system.

"Sometimes pillar-drawing is done more or less carelessly, and stumps containing from say 30 to over 100 tons are left therein, and are never recovered. At times this is unavoidable, but if these stumps were removed with the pillars, and not allowed to remain and become covered with the 'break' of the roof, there would be less loss of coal.

"Temporary cessation of work, caused by strikes, by the mining system employed, or by market conditions, results in general deterioration of timbers and gradual collapse of workings, many of which are not reopened."

Delegates from 20 States and Mexico at Sessions of American Mining Congress

MILWAUKEE, WIS., Sept. 25.—At the end of the first two days' sessions it was apparent that the 26th annual convention of the American Mining Congress and the machinery show that goes with it, had awakened as much interest as usual. Three problems of the mining industry of the country are getting attention—industrial co-operation, the need for standardizing of equipment, methods and processes and for intelligent readjustment of mine taxation. A long list of speakers in the sessions are treating these subjects. The machinery exhibits overflow the main floor of the public auditorium. Delegates are here from about twenty states and Mexico.

At the formal opening exercises last night, presided over by Max Babb, vice-president of the Allis Chalmers Manufacturing Co., Mayor Daniel W. Hoan of the city welcomed the convention. E. L. Phillip, former Governor of Wisconsin, made an address of welcome on behalf of the industries of this region in which he took a fling at the government policy of rigidly limiting immigration when the country could get a great deal of much needed labor by carefully selecting an unlimited number of immigrants at their home ports. He discouraged the movement of negroes from South to North. Sidney Jennings, president of the Mining Congress, replied to the welcomes and declared the convention and exhibition formally opened. Two other speakers who said friendly things about American mining were Señor Moises Perogordo Y. Laso, representing the Mexican Secretary of Commerce, Industry and Labor, and Señor F. Roel, Mexican Consul General.

A message was read from President Coolidge in which he called to mind the fact that this country leads the world in the production not only of coal but of iron, copper, petroleum, zinc, lead, phosphate rock and sulphur and that its mining importance is tremendous. He sent good wishes to the congress and bade the mining interests of the country produce the nation's minerals and metals with the minimum hazard to life and a minimum of economic waste. In his annual report this morning President Jennings of the congress said the congress primarily is interested in mining but it does not urge the claims of mining against those of agriculture, transportation and manufacture, all of

which must progress abreast. Two great problems face the mining industry, he said. One is the waste of mining and the other is the economic disorder caused by the reckless speed at which the country's resources are being extracted. Overproduction of gold was especially mentioned.

Labor relations in coal, he said, are bad largely because the miners' union is "trying to impose an absentee directorship of labor upon the coal-mining industry. I cannot believe the American people will tolerate this domination of a small body of men whose interests lie in perpetuating their own power." He said, "the American Mining Congress is working hand in hand with the National Coal Association, that relationship between the employer and employee in the coal industry should be adjusted so that capital should be adequately rewarded, that labor should receive sufficient remuneration to live and save, and that consumers should get coal at the lowest price compatible with the above two requirements."

The sessions of the convention run all week, closing with the annual banquet Friday night.

Pennsylvania Soft-Coal Operators Prepare To Fight for District Settlements

Notice was served on the U. S. Coal Commission on Sept. 19 by the Central Pennsylvania Coal Producers' Association that the bituminous operators of Pennsylvania intend "going to the mat" with the miners next April on the subject of national agreements.

Declaring that the United Mine Workers has enjoyed a monopoly of labor "through their ability to make a nationwide settlement the law for the bituminous industry," the Pennsylvania operators sound this warning:

"The time is here when operators will be able to have some say about what form and in what manner their relations with the United Mine Workers shall continue. One of the greatest calamities, in our opinion, that could happen to the coal-mining industry is to have the mark of approval placed upon nationwide agreements by any considerable number of the large coal-producing districts of states."

The "monopoly of labor" which the union now holds, according to the operators' statement, can be destroyed only by having the operators refuse to assist in the maintenance of the nationwide agreements.

In addition to outlining the operators' views on the form settlements should take, the presentation deals extensively with the "opposition of organized labor to proper police forces maintained by government," the cost of production, the earnings of mine workers and the number of men in the industry.

The workers, the operators say, have been "able to divide and rule" them during the period of the past five years because of the great activity and abnormal situation in the coal industry created out of war and post-war conditions.

"The United Mine Workers have exercised the vast power placed in their hands by reason of these abnormal conditions in a way that has been detrimental to the unionized coal fields and to the advantage of the non-union coal fields," the statement declares.

The power of the union, it is added, will be lessened with the return to normal conditions in the industry. The operators in the more weakly unionized districts, the statement says, will be able to make wage agreements based upon competitive conditions and will immediately restore their proper competitive relations as compared with the non-union fields.

"Normal economic conditions in the bituminous industry will bring about the destruction of the power which the United Mine Workers so badly used during the past five years," is disclosed as part of Pennsylvania operators' strategy.

An explosion, Sept. 24 in the main shaft of the Reden coal mines at Dombrova, Poland, is believed to have resulted in the death of 110 miners. Fifty bodies have been recovered. As the explosion was followed by fire there was little hope of rescuing alive any of the men who were entombed.

Purchase of Coal on Contract, Says Commission Report, Is to Advantage of Both Producer and Consumer

Purchase of coal on contracts makes for regularity of mine operation and steadies the market, according to a report issued by the Coal Commission Sept. 21. "It is to the advantage of both coal producer and coal consumer that their relations be more or less permanent," says the report. "Every time a producer abandons a market that has been educated to his product, or a large consumer changes his source of supply there is introduced an incentive for more mine development. This shifting about in the search for more profitable outlets or for cheaper and better coal must always continue in a competitive business such as the bituminous coal industry, but the degree to which it has taken place in the past six years has greatly disturbed the trade.

"This unusual shifting about by producers for markets and by consumers for tonnage has been the result of complications in the production and distribution of soft coal introduced by the war and by the nation-wide strikes in the organized coal fields. The measures that have been recommended to eliminate such strikes and reduce irregularity of mine operation and overdevelopment of the producing industry will again make it feasible for consumers to establish firm relations with dependable sources of soft-coal supply. The coal contract is the basis on which that relationship must rest. The Commission, through C. E. Lesher, H. M. Search and Sydney Hale, of the engineering staff, has investigated the nature of coal contracts, the extent of their use, and the performance of both shippers and buyers on their contracts in the calendar years 1920 and 1921. In a subsequent chapter the details of this study will be discussed but the general conclusions are presented here.

"Shipments on Contracts—A majority of the coal producers make contracts for the sale of their product. In 1920, 91 per cent of the commercial coal shipped was from companies that sold all or part of their tonnage on contracts for six months or more, and 9 per cent was from companies that made no contracts. In 1921 the companies making contracts for all or part of their output represented 93 per cent of the total commercial shipments and those companies selling on the spot market had 7 per cent of the total tonnage. The companies making contracts shipped in 1920 79 per cent of their coal on these contracts and in 1921 74 per cent. The total commercial shipments were divided in 1920, 71 per cent on contracts for six months or more and 29 per cent on spot sales or short-term agreements; in 1921, 72 per cent on long-term contracts and 28 per cent on spot sales or short-term agreements. Sales agreements covering less than six months have been considered as equivalent to spot sales. The larger companies sell a larger proportion of their total output on contracts than do the smaller companies.

"Producers contract to sell their coal either directly with consumers or with an intermediary, a selling agent or wholesaler, who in turn resells to the consumer in whole-sale quantities either by contracts or in the open market. In 1920, sales agencies took 42 per cent of the tonnage shipped under contract by producers; in 1921, 45 per cent. This should not be construed as a measure of the quantity of coal handled by jobbers. It is instead a measure of the extent to which producers, notably small operators, contract for the disposal of their product through separately incorporated or independent selling departments. The merchandising of coal is a separate function from its production. Between 40 and 45 per cent of the commercial tonnage that is sold on contract by the producer is handled by selling departments or sales agents distinct from the operating company. The remainder, or between 55 and 60 per cent, is contracted for sale by selling departments of the producing companies.

"Contracts direct with consumers may be either 'output' contracts, by which the entire production is taken, 'require-

ment or surplus-tonnage' contracts or definite tonnage contracts. The definite tonnage contracts represented 41 per cent of the total contract shipments in 1920 and 36 per cent in 1921; requirement or surplus-tonnage contracts were 9 per cent in 1920 and 10 per cent in 1921; and output contracts took 7 per cent in 1920 and 8 per cent in 1921. The remainder, 1 per cent in each year, not classified, was that contracted by the smallest group of producers.

"The larger consumers depend mainly on the definite tonnage contract. The railroads have been the largest buyers using output contracts, in which class are those dependent on assigned cars; the public utilities have used the requirement or surplus-tonnage contract more than any other class of consumers. Retail dealers do not, as a rule, buy their coal on contracts, but when they do it is largely on definite tonnage contracts. Producers sell some coal to wholesalers on definite-tonnage, surplus-tonnage, and output contracts, but between 85 and 90 per cent of the contracts between producers and middlemen are sales-agency contracts that in effect make the middleman the selling department of the producer as respects the tonnage contracted.

"That such a large portion of the output is handled through a selling agent or a wholesaler instead of being sold directly by the producing company to the consumer or retail dealer is significant of the complex machinery of distribution that has been built up in the bituminous-coal industry.

"Performance on Contracts—Performance can be measured only on those contracts calling for definite tonnage. The percentages in the following summary set forth the relation of actual shipments to quantity due on definite tonnage contracts.

PERCENTAGE PERFORMANCE ON DEFINITE TONNAGE CONTRACT
(As reported by producers of bituminous coal representing 68 per cent in 1920 and 72 per cent in 1921, of the total commercial shipments.)

EAST OF THE MISSISSIPPI												
Size of Producer Class	Railroads		Public Utilities		Retail Dealers		Industrials		Wholesalers		Total

All Sizes	101	101	99	91	100	100	91	90	100	100	98	97
Grand total	94	93	81	90	76	68	86	79	75	70	86	84

Note—Class I includes producers having shipments of 500,000 tons per year or more; class II shipping between 100,000 but less than 500,000 tons; class III shipping 50,000 but less than 100,000 tons; class IV shipping 10,000 but less than 50,000 tons; and class V those shipping less than 10,000 tons per year.

"Considered from a purely statistical standpoint, the performance on definite-tonnage contracts east of the Mississippi River, where the bulk of the coal is both mined and consumed, is not a record to excite admiration, and for some classes of producing companies the performances shown was deplorable. Figures showing a 60 to 85 per cent performance on definite tonnage contracts suggest either external interference with performance, the recurrence of which, if possible, should be guarded against, or loose practices within the industry that should be corrected if the stabilization that might reasonably be expected from contract sales is to be attained. . . .

"If contracts, and particularly definite-tonnage contracts are to have the stabilizing influence in the industry that might reasonably be expected, it is patent that there must be a decided change in mental attitude upon the part of both consignor and consignee. To effect this and to give

contracts the place to which they are entitled, the Coal Commission makes the following recommendations:

"Recommendations for Reforms in Contract Practices.—

(1) Every definite-tonnage contract should be recognized by both parties to an agreement as a fixed obligation upon the part of the seller to ship and the buyer to accept the tonnages called for in the contract, except when prevented by causes beyond the control of the parties. These causes should be definitely stated and the number should be cut to the irreducible minimum. Causes excusing the shipper for failure to deliver must of necessity include:

"(a) Strikes and transportation disabilities, *subject to the limitations later set out*, and breakdowns.

"(b) Government interference with performance. While the shipper is entitled to protection in this regard, every effort should be made by government officials to discourage, and if possible eliminate, all forms of government regulation in times of emergency that interfere with contract performance.

"Upon the part of the purchaser:

"(a) Strikes at the plant of the consumer.

"(b) Plant breakdowns.

"It will be noted that no provision is made for suspension or reduction in the case of changed business conditions. To recognize such an exception and to permit errors in judgment to be used as an excuse for contract avoidance would defeat the primary purpose of contracts.

"(2) Contract tonnage in every and all cases should have precedence over spot-coal deliveries. All spot-coal orders should be taken subject to contract priority. Moreover, the purchaser should be given a yardstick by which to measure contract performance. He should know the estimated annual output of the shipper and the actual monthly

shipments. He should also be kept informed as to the total contract obligations of the shipper, and, in the event that the actual performance was less than the contract commitments, then adjustment should be made upon a percentage basis. . . .

"(3) No fixed rules may be laid down in respect to price. There are contracts which name a definite price for the period of the contract, others which provide for a sliding scale, still others that give the buyer the benefit of lower spot prices, but protect him against higher quotations, and some in which the price is a sum over and above the cost of production. With the tonnage obligation definitely fixed, the question of price becomes subordinate. If the seller knows he must ship and the buyer that he must accept the tonnages specified, it is reasonable to assume that there will be a firm meeting of minds upon the question of price. This recommendation is made, however: Where the price is not definitely named at a fixed sum per ton in the agreement, the manner in which it is to be determined from time to time and the basic data to be used in such determination should be so clearly stated and understood that it will become impossible for either party to use subsequent disputes or disagreements as to price as an excuse for avoiding their contract obligations on delivery and acceptance. A like recommendation may be made with respect to quality. . . .

"Coal shippers and coal consumers must become impressed with the idea that a contract means a fixed obligation with respect to both delivery and acceptance of tonnage and that no shipper with contract commitments should enter the spot market until he has fully discharged his contract obligations, or buyer shut off contract shipments while he purchases lower priced spot coal."

Operators' Committee Reports on Number of Investors in Bituminous Coal Industry

In a memorandum filed with the United States Coal Commission Sept. 12, the Bituminous Operators' Special Committee reports that the number of individuals who have their money at stake in the coal business probably is greater than the number of employees in that business. The figures indicate that there are about 202,618 persons who hold stock directly in coal companies. They also show that there are at least 200,000 more who are indirectly interested in coal companies through shares of stock in holding companies.

"That would give," says the memorandum, "a total of over 400,000 as the number of individual holdings of investors who are interested in the bituminous coal industry."

"The various forms of business organization represented," says the memorandum, "are given in the following table:

TYPES OF ORGANIZATIONS

Class*	Corporations (Not Subsidiaries)	Partnerships	Individual Enterprises	Subsidiary Corporations	Total
I	124	0	0	24	148
II	558	22	9	39	628
III	409	36	15	17	477
IV	972	222	89	24	1,307
V	368	143	93	5	608
Total	2,430	423	206	109	3,201

"The results as to number of investors, exclusive of investors in holding companies, are as follows:

NUMBER OF INVESTORS

Class*	Stockholders	Partners	Individual Owners	Total
I	39,632	0	0	39,632
II	35,599	80	9	35,688
III	16,294	136	15	16,445
IV	25,649	837	89	26,575
V	7,082	452	93	7,627
Total	124,256	1,505	206	125,967

* This refers to the Geological Survey classification. It is as follows: Class I, Companies producing over 500,000 tons a year; class II, companies producing 100,000 to 500,000 tons a year; class III, companies producing 50,000 to 100,000 tons a year; class IV, companies producing 10,000 to 50,000 tons a year; class V, companies producing under 10,000 tons a year.

"According to this tabulation the total number of in-

vestors in 50.18 per cent of the companies, exclusive of investors who own stock in holding companies, is 125,967. It would seem proper to estimate the number of investors in the companies which have not reported on the assumption that the number of investors in each company that has not reported will average the same as the number of investors in the companies of the same class that have reported. On this basis, we may compute as indicated by the following table:

ESTIMATED NUMBER OF INDIVIDUAL HOLDINGS

Class	Individual Holdings in Companies Reporting (Exclusive of Subsidiary Corporations)	Per Cent Total Companies Reporting	Total Individual Holdings (Estimated)
I	39,632	74.74	53,026
II	35,688	74.14	48,136
III	16,445	67.47	24,374
IV	26,575	51.17	51,935
V	7,627	30.33	25,147
Total	125,967	50.18	202,618

"This gives the figure of 202,618 for the total number of individual investments in the bituminous-coal industry, exclusive of investments in companies which own stock of subsidiary corporations which are engaged in the coal business, and exclusive of bond holders and similar indirect investors.

"It is a difficult matter to estimate with any exact degree of accuracy the number of stockholders in companies which own the stock in subsidiary corporations engaged in the production of bituminous coal. . . .

"There are no doubt a number of inevitable duplications in these tabulations, due to the same persons being stockholders in several companies, or partners in several firms. We do not believe these duplications to be very numerous in the aggregate. A liberal estimate would, we believe, be 10 per cent. If we deduct 10 per cent from the figure given above, which is the estimated total number of individual holdings, we arrive at the final figure of more than 360,000 as the total number of individual investors in coal companies in the United States.

"This figure does not include the very large number of persons who own bonds of coal companies, and the still larger number who have an indirect but highly important interest in the coal industry through banks and other institutions which participate in the financing of the coal business."

Urges Large-Scale, Regular Storage Of Soft Coal by Consumers

Commission Report Advises Heaviest Buying Between April and September, When Price and Consumption Are Low

Storage of coal by consumers is the all-important balance wheel between fluctuating consumption and variable production. It is the consumers' insurance against temporary failures of transportation, such as caused by storms. It is the only protection yet devised for the consumer against protracted general stoppage of coal mining or of railroad deliveries.

After the experience of this country in 1917-1918, in 1920, in 1922 and finally in 1923 in the storage of bituminous coal, it seems hardly necessary to call attention to the subject. In 1918 some 63,000,000 tons of soft coal were in consumers' storage piles on armistice day, an unprecedented quantity. In 1920 the lack of storage, for which the consumers were in part responsible, having so generously burned up their surplus coal in 1919, cost the buyers of soft coal millions of dollars when they precipitately sought to refill their bins during the summer of that year.

In anticipation of the general strike of soft-coal miners on April 1, 1922, the country bought and stored more than 60,000,000 tons of soft coal in the fall and winter of 1921-22. This huge stockpile, largely depleted during the 5 months' strike, has been nearly rebuilt in the past spring and summer. More than 50,000,000 tons were on hand Sept. 1, 1923.

These facts about storage by industries, public utilities and railroads, the large users of bituminous coal, are recited to show that storage has been and can at any time be undertaken on a large scale in this country. The consumer of anthracite, the householder, years ago learned the distinct advantage of putting all or a large part of the winter requirements into his cellar during the warm months. The fact of summer buying of anthracite, assisted by the summer discounts in price, was a large factor in regularizing the anthracite industry. This should be continued and perhaps extended to the bituminous-coal industry.

Regular, systematic, large-scale storage of bituminous coal by consumers during the seasons of low consumption is the public's largest opportunity and responsibility in solving the coal problem. Another direction in which the buyer can and should help not only himself but the coal business, is in proper selection of his fuel. The direct bearing of consumers' storage in regularity of mine operation, the reduction of overdevelopment and the lengthening of the mine workers' year are discussed in other chapters of this report. The Commission seeks here to emphasize what it means to the consumers—that is, the public.

The proper methods of soft-coal storage, the depth of piles, protection against fires and spontaneous combustion, reclamation, loss of heating value, degradation, are technical questions on which this Commission has made no investigation. These subjects have been studied intensively by the Bureau of Mines and state and private institutions, as the Illinois Engineering Experimental Station, the Carnegie Institute of Technology and the International Railway Fuel Association. The results of their investigations are published and available to all.

The conclusions of those who have studied the technical question of soft-coal storage are that there is a proper, safe way for the storage of any and all kinds of soft coal and that improper methods will render the best coal liable to spontaneous combustion. For most coals the losses in heating value and degradation are comparatively small.

The Commission made a systematic field investigation among industrials, railroads and public utilities of methods and costs of storage of soft coal. In this study, which was conducted by R. H. Kudlich, mechanical engineer of the Bureau of Mines, under the direction of F. R. Wadleigh, Federal Fuel Distributor, particular attention was given to

the policy of these buyers toward accumulation of reserve coal. It was found that in general the larger railroads and the public utilities have a definite policy on storage. It is, briefly, that small reserves must always be maintained and that unusual reserves are only to be accumulated against impending stoppages in supply. In areas as remote from the mines as New England and the Northwest what might elsewhere be considered a large reserve becomes inadequate insurance against interrupted supply, and the reserves in these distant markets are nearly always the largest in the country both in tons and in terms of days' supply.

The cost of storage is an indefinite figure. Hundreds of firms storing coal were interviewed and their records examined, but it is found to be difficult, if not impossible, to give even rough general figures on the cost of storing coal. Two neighboring plants may each store 3,000 tons. One plant, with hand-fired boilers has a trestle bunker adjacent to the boiler house where this tonnage can be dumped at an additional labor cost of, say, 5c. a ton for trimming. The bunker is used for the ordinary "car-to-boiler" operation and the handling of this additional tonnage does not add to the interest or maintenance charges on the equipment. When reclaiming from this storage the fireman wheels the coal as he would ordinarily, so that reclaiming represents a little extra labor to him but no additional operating expense. The only items which can properly be charged to storage here are labor cost of trimming, interest on investment (coal and freight), say 25c., and deterioration and shrinkage, say 25c., a total of 55c.

The adjoining plant is equipped with overhead bunkers with capacity for a week, receiving the coal by elevator from a track hopper. Here the existing equipment cannot be utilized for storage, additional mechanical equipment must be installed or the coal handled by hand labor into and out of storage. In this case the labor charge may run from 5c. or 10c. per ton with mechanical equipment in and out of storage, to 50c. or \$1 per ton with hand labor.

STORAGE COST RANGES FROM 50C. TO \$1.50 PER TON

Considering interest and maintenance of the extra mechanical equipment, interest on the coal, cost including freight, and deterioration and shrinkage of coal, the costs range from 50c. to 75c. for large storages, 50,000 tons or more, to \$1 to \$1.50 per ton for small storages of a few hundred to a thousand tons; these costs are on the quantity of coal actually stored. Spread over the total tonnage used in a year, and figured as cost per ton for all coal used, the figure is much less. This is the fair basis for calculating the cost of storage.

The consumer who has learned to store coal only as a necessary measure of self-protection should undertake it as regular business practice. In every year of normal business and industrial conditions, the six months from April to September, the price of bituminous coal is lower than in the fall and winter. In these months the consumption of coal is lowest. It is the part of good business for the buyer to take in during the summer months more coal than he burns, to put it into storage and use the reserve thus accumulated during the winter months when requirements are above the average. The best practice, not only for the buyer but for the seller, is to have the year's coal produced and shipped in 12 equal monthly installments. The buyers who wait until fall or winter to place their orders may expect to pay a higher price.

Carrying this idea to the consumer in an effective way calls for continuing educational efforts. This Commission has reported at length on the costs to the coal producer of irregular production. It has offered suggestions and made recommendations looking toward regularizing the production of coal but it must leave to others the encouragement of consumers to do their part by proper, timely storage.

The Federated American Engineering Societies is now preparing a report on coal storage that is to be addressed to the consuming public. In this work the Coal Commission is co-operating by making available to the engineers the detailed results of its investigation.

Brydon Committee Completes Presentation Of Bituminous Operators' Case

The Bituminous Operators Special Committee filed its last statement with the U. S. Coal Commission on Sept. 22. The work of this committee, headed by John Brydon, now the president of the National Coal Association, began in November, 1922, immediately after the organization of the Coal Commission. H. L. Stimson and G. H. Dorr were engaged as counsel. Under their direction, and with the assistance of a large staff of economists, statisticians, engineers and field men, the Special Committee prepared and transmitted to the Coal Commission more than thirty printed documents in the form of letters, memoranda and briefs. On important matters the Special Committee represented every bituminous coal field in the United States except Iowa. A number of local associations submitted statements of their case directly to the Commission. The following is a list of documents submitted to the Coal Commission by the Bituminous Operators Special Committee:

Reply of the Bituminous Operators' Special Committee to the Letter of the United States Coal Commission. Date of filing, Nov. 10 1923.

Letter and General Brief on the Policy and Methods of the United Mine Workers of America. Date of filing, April 5, 1923.

Letter and Brief on Campaign of Aggression of United Mine Workers in State of Ohio. Filed April 16, 1923.

Northeastern Kentucky: Labor Monopoly versus the Open Shop. Date of filing, April 25, 1923.

Letter to the United States Coal Commission on the Check-off. Date of filing, April 30, 1923.

Letter and Statement on Herrin. Filed May 16, 1923.

Letter Suggesting a Method of Analyzing the Data as

to Cost and Realization Furnished by the Operators on Forms C-1 and C-2. Date of filing, May 25, 1923.

Letter and Memorandum on Methods of Determining the Rate of Profit in the Bituminous Coal Industry. Date of filing, June 14, 1923.

Memorandum on Labor Relations in the Coal Industry with Suggestions for Constructive Action. Date of filing, June 26, 1923.

Summary of Suggestions for Constructive Action as to Labor Relations in the Coal Industry. Date of filing, June 26, 1923.

The Campaign of the United Mine Workers of America Against the Non-Union Mines of Utah in Aid of Its 1922 Nation-Wide Strike. Date of filing, June 28, 1923.

Proposed Findings as to Certain Aspects of the Bituminous-Coal Mining Industry. Date of filing June 30, 1923.

The Campaign of the United Mine Workers of America Against the Coal Mines of Alabama in 1920 and 1921. Date of filing, July 30, 1923.

Summary of the Oral Argument made before the United States Coal Commission, July 30-31, 1923. Date of filing, Aug. 15, 1923.

The United Mine Workers in West Virginia. Date of filing, Aug. 18, 1923.

Appendices to West Virginia brief. Date of filing, Aug. 18, 1923.

Memorandum on the Treatment of Income and Excess Profits Taxes in Determining the Margin of Profit. Date of filing, Aug. 31, 1923.

Memorandum on the Proper Treatment of Coal Reserves in Determining the Fair Present Value of Mining Properties. Date of Filing, Aug. 31, 1923.

BITUMINOUS OPERATORS' SPECIAL COMMITTEE

The Company Town. Date of filing, Sept. 8, 1923.

Letter on Pascoe Affair. Date of filing, Sept. 7, 1923.

Comparative Efficiency of Labor in the Bituminous-Coal Industry under Union and Non-Union Operation. Date of filing, Sept. 10, 1923.

Memorandum on the Number of Investors in Bituminous Coal Properties. Date of filing, Sept. 12, 1923.

Memorandum on the Strike of 1922. Date of filing, Sept. 15, 1923.

Memorandum on Variation of Living Costs in the Bituminous-Coal Fields. Date of filing, Sept. 17, 1923.

Maryland: The Campaign of Violence Conducted by the United Mine Workers of America against the Open-Shop Mines in the Georges Creek and Upper Potomac Fields. Date of filing, Sept. 18, 1923.

Summary of Statement on Comparative Efficiency of Labor in the Bituminous-Coal Industry under Union and Non-union operation. Date of filing, Sept. 18, 1923.

Comparison of Wages of Bituminous Miners with Wages of Employees in Other Industries. Filed Sept. 18, 1923.

Living Conditions in 14 Coal Fields in 11 States. Date of filing, Sept. 20, 1923.

Monthly and Daily Earnings of Bituminous-Coal Miners. Date of filing, Sept. 21, 1923.

The Influence of Labor Cost on the Prices of Bituminous Coal. Filed Sept. 22, 1923.

STATEMENTS TO THE COMMISSION BY LOCAL ASSOCIATIONS

Brief of the Central Pennsylvania Coal Producers' Association and the Association of Bituminous Coal Operators of Pennsylvania. Date of filing, June 12, 1923.

Statement by Non-Union Operators of Southern West Virginia. Filed June 12, 1923.

Series of Statements by Illinois Coal Operators. Filed June 18, 1923.

Brief of Montana and Southern Wyoming Coal Operators.

Statement of the Southwestern Interstate Coal Operators' Association of Missouri, Kansas, Arkansas and Oklahoma. Date of filing, June 23, 1923.

Statement to the United States Coal Commission by the Somerset County Coal Operators' Association. Date of filing, Aug. 4, 1923.

Statement to the United States Coal Commission by the Kanawha Coal Operators' Association. Filed Aug. 6, 1923.

Statement to the United States Coal Commission by the Southern Appalachian Coal Operators' Association. Date of filing, Sept. 11, 1923.

Statement of Alabama Coal Operators to the United States Coal Commission. Date of filing, Sept. 11, 1923.

Supplemental Brief of Central Pennsylvania Coal Operators. Date of filing, Sept. 19, 1923.

Union Fights Use of Modern Machinery In Illinois Coal Mines

There has been a continual fight against the introduction of modern mining machinery in the bituminous coal mines of Illinois on the part of the United Mine Workers—and all the mines in the state are unionized—part of the fight being conducted by strikes, a selected list of which has been submitted to the U. S. Coal Commission by Illinois coal operators.

In some instances, where operators for greater efficiency and safety sought to install machines, the miners flatly refused to change from hand to machine mining. There were numerous instances of arbitrary limitation of the method and manner in which the machines should be used. The union, powerful enough to force concessions, has made of the demanded conditions for machine mining established practice now. A list of the strikes brought on by the intro-

duction of mining machinery sent to the Coal Commission includes the following:

A strike at St. David against changing from hand mining.

A strike lasting eleven weeks at St. David and Dunfermline for the same reason.

A strike at Hillsboro by machine men, who refused to accept regular machine scale of pay for cutting and loading coal where an entry was being widened to put in a switch.

At Sparland a mine was idle twenty-five work days because the men refused to handle clay cuttings after the machines without extra pay.

After a change in the machine mining rate had been agreed to at a mine at La Marsh, 161 men struck in protest against the change, staying out two days.

At Kortkamp refusal to double shift the machines shut the mine down for ten days when 336 men struck.

Brydon Committee Files Brief on Influence Of Labor Cost on Soft-Coal Prices

The Bituminous Operators' Special Committee submitted to the U. S. Coal Commission on Sept. 22 the last of its series of briefs, entitled "The Influence of Labor Cost on the Prices of Bituminous Coal."

Colonel Henry L. Stimson and Goldthwaite H. Dorr, of counsel for the Special Committee, who had prepared the brief, summarize their conclusions as follows:

"(1) From 1886 to 1922 the average price of bituminous coal in the United States at the mouth of the mine was lower than in any other civilized country in the world.

"(2) In the 30-year period from 1886 to 1915 the average price of coal in the United States actually declined, while prices of bituminous coal in the four other principal coal producing countries increased to more than double the 1886 prices.

"(3) The decline in bituminous coal prices in the United States during this period was due to the opening up of hitherto untouched coal reserves and to the introduction on a large scale of modern mining machinery.

"(4) This decline in prices was brought about in spite of the fact that labor cost, as represented by wage rates of miners, rose steadily during the entire period.

"(5) Only after 1915, due to the increase in the centralized power of the United Mine Workers of America during and after the war, did the item of labor cost rise so steadily that it overbalanced the increases of mining efficiency and caused a rise in the price of bituminous coal.

"(6) Labor cost is the principal element in the cost of production of coal, and amounted to 67.7 per cent of the total cost of mining in 1921.

"(7) The labor cost of production of bituminous coal in 1921 was more than the total cost of production in 1916, due to the heavy increase in wage rates forced on the operators by the monopoly power of the United Mine Workers in the intervening years.

"(8) Due to the fact that wage rates in the bituminous coal industry have not been deflated since 1920, as have the wages of labor in other industries, the labor cost of bituminous coal mining still remains at or above the war-time peak, and the public must continue to pay the increased prices due to this inflation until such time as these wages are deflated to the levels of wages paid for similar work in other industries."

THE EDITOR OF *Coal Age* is in receipt of the following letter from F. R. Wadleigh:

"The official existence of the Federal Fuel Distributor will end on Sept. 22, as required by the act creating the office. Before going out of office, let me take this opportunity to express my hearty thanks and appreciation, officially and personally, for the co-operation and assistance that you have given me in my work as Federal Fuel Distributor. Only through the voluntary help and good will of those engaged in the coal industry has it been possible to bring about such satisfactory results as have been attained, and I wish to make formal acknowledgment to that effect."

Production and the Market

Weekly Review

Anthracite production has been resumed and shipments are going forward at the new "company" prices which at the mine are from 70c. to 90c. higher on egg, stove, and nut than before the strike, and from 15c. to 30c. higher on pea coal. The miners were in no particular hurry to start work, and after the agreement was signed last week but half the mines were able to start up the first day and those were short-handed. Coal arrived in New York tidewater within 48 hours after mining started.

The demand for domestic sizes of anthracite is almost as strong as before the strike. That the trade expects a continuation of this active market for some time to come is indicated by the independents pricing the family sizes up to \$11.50 per ton.

Steam coal demand is sluggish. The anthracite fine sizes are moved with the greatest difficulty. The soft-coal market is flat with a tendency toward even lower prices. Coal Age Index spot coal prices at the mines on Sept. 24 was 200, a slight decline from the previous week.

RAILROADS INCREASE RESERVE STOCKS

Production of bituminous coal is holding up above the 11,000,000 tons per week level. The cumulative total of soft-coal production to date, 391,000,000 tons, is less than two per cent below the average for the same period in the three boom years of 1917, 1918, and 1920. Ten million tons of this production has been added to railroad storage since the first of January. The railroads now have more coal on the ground than they ever before had in total storage.

In Chicago the market for domestic coals is recovering slowly, while screenings and middle sized prepared coals drag heavily. No activity is expected for at least thirty days. In Ohio the steam coals are not showing strength, but there is a fair demand for domestic sizes. The market there was more or less affected by the early termination of the anthracite strike as well as by warm

weather. In New England the buying of steam coals is practically at a standstill.

There is practically no market for bituminous screened coals. Producers of some of the better grades report demand dull with no immediate prospects of betterment. The coke situation had a setback following the reaching of the agreement in the anthracite fields. Quotations dropped and new orders are scarce.

LAKE COAL DUMPED
(Net Tons)

	Week Ended Sept. 17	Season to Sept. 10
Cargo	787,509	20,404,360
Fuel	55,861	1,087,443
Totals	843,370	21,491,803

Export demand has slumped. Chartering was quiet throughout last week. At Hampton Roads dumpings for all accounts during the week ended Sept. 20 was 369,153 net tons, as compared with 327,871 tons the previous week.

Steam Coal Drags in Midwest

Domestic market in the Chicago region is slowly recovering while screenings and middle sized prepared coals drag heavily. There is little in the present state of the market to enliven selling agencies' spirits for nothing active is expected to develop for at least another month. Meanwhile steam buyers hang back and screenings sink. No southern Illinois producer can get anywhere near the

Estimates of Production

(Net Tons)

Calendar year	4,484,000	13,847,000

(a) Subject to revision. (b) Revised from last report

recent top price of \$1.85 for screenings. The top now is about \$1.60, with the average below \$1.50. Some sells down to \$1.25. Central Illinois bumps along at 90c.@\$1.15 and Standard District hardly ever rises above \$1. The accumulation of no-bills in the middle prepared sizes is a real source of trouble to most mines. Railroads are urging the producers to do something about it.

Day-to-day buying for domestic needs holds lump prices up fairly well. Franklin County Association mines producing the best prepared coal in Illinois are able to stick closely to the top price of \$4.35, though the range on this coal runs down to \$4. Central Illinois is now able to get \$3.25 for most of its lump. Good Fourth Vein Indiana lump brings about the same with Fifth Vein trailing along about 50c. to the rear. The state of the market makes it necessary to get full price for lump or shut down the mines.

Pocahontas continues to come into the territory in considerable volume, meeting a light demand at no increase in the mine run price of \$2.75@\$3. A small quantity of lump sells for about \$6. There is only moderate interest in anthracite. Yards are said to be about empty. No

fresh coal is due to reach Chicago for another week and no circulars have been officially announced yet. However, one old line company is reported to be mailing out a price list showing an increase of 90c. on grate, egg, stove and nut and 75c. on pea.

Southern Illinois fields are working about two days a week on an average, though the bigger mines with the stronger selling forces are able to beat this. Very little coal is moving south through the Thebes and Cairo gateways for southern coal and oil have taken those markets. Standard District could not hold the pick-up that favored that region a week or so ago. Big lump is all that will move. Mt. Olive field feels a little improvement.

In St. Louis the market has returned to sluggishness. Steam buyers take a little wagon load stuff from day to day but that is about all. Dealers' yards are full with nothing moving out but a little low and middle grade lump such as Standard and Mt. Olive. No interest has been shown in anthracite, smokeless or coke.

Kentucky Is Fairly Busy

While some complaint is being heard concerning lack

* Net tons, f.o.b. mines. † Advances over previous week shown in heavy type, declines in italics.

This diagram shows the relative, not the actual, prices on four-teen coals, representative of nearly 90 per cent of the bituminous output of the United States weighted first with respect to the proportions each of slack, prepared and run-of-mine normally shipped, and second, with respect to the tonnage of each normally produced. The average thus obtained was compared with the average for the twelve months ended June, 1914, as 100, after the manner adopted in the report on "Prices of Coal and Coke, 1913, 1918," published by the Geological Survey and the War Industries Board.

of demand which appears to be general in most markets, the mines are fairly busy on prepared sizes and are holding and getting fair to good prices. A good many operators of eastern Kentucky are holding for \$3.75@4 for prime block coal and are said to be getting it, although some have sold for \$3.50. There is a fair demand for all grades of prepared size coal, as domestic consumers are stocking, and retailers are being forced into buying more coal.

Steam coal is a bit draggy, as heavy production of prepared has resulted in an oversupply of screenings. While industrial consumption is good, many buyers are well stocked, and are only taking a little. Very little mine run is being produced as there isn't much demand for it at a time when cheap screenings are in good supply.

Lake movement from East Kentucky continues good and is accounting for some of the oversupply of screenings. However, screenings at from 80c. in western Kentucky, to \$1.40 for best gas screenings in eastern Kentucky, are not as low as is frequently the case in the summer and early fall.

Northwest Trade Quiet but Steady

Throughout the Northwest there is steady movement of coal but without special interest in any particular grade. In Duluth and the Twin Cities anthracite was in strong

demand until the hard coal settlement was made. Since then consumers have quieted down. However, a good deal of the approximate 900,000 tons of anthracite thus far received has been shipped off the docks. Good Illinois coal by rail into the southern part of Minnesota is stiffening from \$3.75 to about \$4. The fight for business keeps dock soft coals from advancing, however.

At Duluth no more cargoes of hard coal are expected for another twenty days. Shipments of bituminous have continued heavy, piling up a total of about 5,000,000 tons. This does not count railroad or steel corporation coal. The Head-of-the-Lakes harbor is piled high with coal and unless buying starts out briskly soon, there is danger of a tie-up.

Duluth prices of bituminous remain fairly firm, with a slight decline in screenings. They are as follows:

Youghiogheny, lump, \$6.50; run of pile, \$5.50; screenings, \$4; Splint, lump, \$7; run of pile, \$6; screenings, \$4.25; Hocking, lump, \$6.25; run of pile, \$5.25; screenings, \$3.75; Kentucky, lump, \$7.50; run of pile, \$7; screenings, \$4.50; Pocahontas, lump, \$10; run of pile, \$6.50; screenings, \$6.

Briquets, made of Pocahontas screenings have been priced at \$10 and coke is selling at \$10.50. Anthracite remains firm and is quoted: Egg, \$12.50; nut and stove, \$12.80; pea, \$11; buckwheat, \$8.50.

Milwaukee receipts of soft coal by lake in September show a marked falling off as compared with the previous months, but there is plenty of time in which to pile up more coal. Cargo receipts thus far aggregate 630,419 tons of anthracite, and 1,999,278 tons of bituminous coal.

Western Market Picks Up

Colder weather in the Rocky Mountain region and in Utah has stirred up some buying of domestic sizes and circulars on large coal are well maintained. Industrials are not taking much however. Prices have not changed and car supply throughout the region is good. In the Southwest steam coals are especially slow but Kansas and Arkansas mines are placing a good deal of prepared stuff.

Ohio Steam Coal Market Dull

The steam grades are not showing much strength in the Ohio markets. At Columbus domestic sizes are in fair demand, while the demand for the steam coals is not so strong as it was a few weeks back. The settlement of the anthracite strike together with warmer weather is attributed as the reason for this dullness. Dealers' stocks are reported as fair. Household buying is fair, with retail prices steady. Steam coal users are mostly ordering for current consumption. Reports to the Southern Ohio Coal Exchange from 443 mines indicate a production of 176,026 tons during the week ended Sept. 8. The position of domestic block and smokeless lump and egg coals in the Cincinnati market is firm. Retail buyers were more numerous on the market during the past ten days than for some time past and are urging quick shipments. While the demand for smokeless lump and egg continued strong, run of mine and screenings weakened. West Virginia 2-in. lump was quoted at \$2.75@3, and southeastern Kentucky 2-in. lump at \$2.50@2.75.

Steam coal consumers in the Cleveland market are pursuing a hand to mouth policy in buying, and see nothing to jeopardize their safety in continuing to do so. During the last week there was a decided let up in inquiries from steam consumers, and retail dealers who stocked up in anticipation of prolonged idleness in the hard coal fields are not active. They are however active in Pocahontas and anthracite for domestic consumption.

The market at Pittsburgh is dull. Consumers are not inquiring for coal and do not seem to care to know about prices. This situation is due in part to the settlement of the anthracite difficulties and the disposition on the part of business to be conservative in making commitments. Sales of steel are also light and the immediate future is uncertain. Production in Central Pennsylvania continues heavy and car supply is good. Buffalo reports little activity, with quotations for soft coal weak. There are many complaints of poor business.

New England Market Quiet

In New England the market for steam coal shows no redeeming quality. Buying seems practically to have been wiped out, and persistent efforts to dispose of cargoes on the market have no result. A few venturesome shippers sent coal forward all-rail in anticipation of the anthracite shutdown, but latest reports show the coal still on hand at destination awaiting sale. The same extent applies to cargoes afloat in Boston harbor that have been here now for several weeks.

Neither all-rail nor by water is there any inquiry worth mentioning. Prices are depressed on what coals offer, and only specialties are securing new business and those only in a much restricted sense.

No. 1 Navy grades at Hampton Roads are still in the doldrums. While contractors are accepting deliveries in fair volume there is next to no spot business. When any inquiry is developed most of the agents are inclined to quote \$4.90 or less in order to save car service. Factors at this end are asking from \$6.40@ \$7 per gross ton on cars, but only a very light tonnage is changing hands at those figures.

A diminishing volume from West Virginia and from Central Pennsylvania is being dumped at the Philadelphia and New York piers for movement coastwise. Most of the holes are being rapidly filled, however, and even the gas companies have reserves far beyond what would be regarded as normal for this season. New England as a whole is extremely well stocked against any possible contingency the coming winter.

Seaboard Soft-Coal Buying Slow

Soft coal buying along the Atlantic seaboard continues slow and inactive. Contract coals move in good volume although some consumers indicate a desire to receive slower shipments. Demand for the cheaper grades at tidewater points is easier and some of these mines have stopped operations. Some houses report an increase in inquiries and admit they are doing a normal business. Railroad buying is quieter and present shipments are said to be on old commitments. The trade at Birmingham is dull. Increased activity expected in September did not materialize. Consumption of steam coals is light and there is little bunker business being offered. A minimum of contract requirements are being taken by the railroads, and several furnace stacks have been blown out, which reduces the tonnage of coal required for coke manufacture.

Although the lake season is drawing to a close the movement of soft coal across the Lakes increased about 37,000 net tons during the week ended Sept. 16, when compared with the previous week, according to the Geological Survey reports. During the present season the cumulative dumpings of cargo coal amount to 20,451,238 net tons, as compared with 17,104,787 tons in 1921 and 13,170,068 tons in 1920. Last year the cumulative dumpings for the corresponding period was 7,077,670 tons.

Anthracite Coming Forward Slowly

Shipments of anthracite are coming forward slowly, due to the mine workers not having returned to the mines in large numbers until early this week. The advance in prices for the domestic coals at the mine, was not surprising to

the trade. No change in prices for buckwheat, rice and barley coals is expected in view of the low prices at which bituminous coals can be purchased. Demand for the egg, stove and chestnut coals is heavy, some of the independent producers and selling agents refusing to accept new orders until the old orders already entered have been nearly cleaned up. Retail dealers in most instances are waiting until all producers have announced their prices before adjusting the retail schedules.

There is little demand for coke, as a result of the resumption of mining in the hard-coal fields and the poor outlook in the iron and steel industry. A few contracts have been made for the current quarter, and the furnacemen involved have no disposition to contract for the fourth quarter. Asking prices for heating coke are around \$3.75, furnace coke, \$4.50, and foundry coke \$5.50@ \$6, which prices are practically nominal. Production of beehive coke, says the Geological Survey, decreased in the week ended Sept. 15 to 317,000 net tons as compared with 345,000 tons the previous week. The decline was felt in the Pennsylvania-Ohio and West Virginia districts.

Consults Retailers on Closing Fuel Yard

Secretary of Interior Work has asked the National Retail Coal Merchants Association for its views as to continued operation of the Government Fuel Yard, operated by the U. S. Bureau of Mines, believing that the government should not conduct business which an individual or firm can better perform. Retailers have been asked if they have facilities in the District of Columbia for storage of coal to supply fuel for government departments; whether they can supply the government more cheaply than the fuel yard; whether they are able to bid and meet other problems connected with delivery and handling government contracts; whether they will give assurances that the government will be better served and local residents will not suffer if the fuel yard is abolished; how much lower prices per ton to the government and to local consumers would result from retailers supplying government requirements; at what margin per ton retailers are prepared to sell coal of various grades in the District of Columbia. The Secretary says that it is possible that legislation will be obtained from Congress to permit contracts for more than one year, and he asks for what term retailers are prepared to contract.

Twenty Firms Bid on Coal for Army Posts

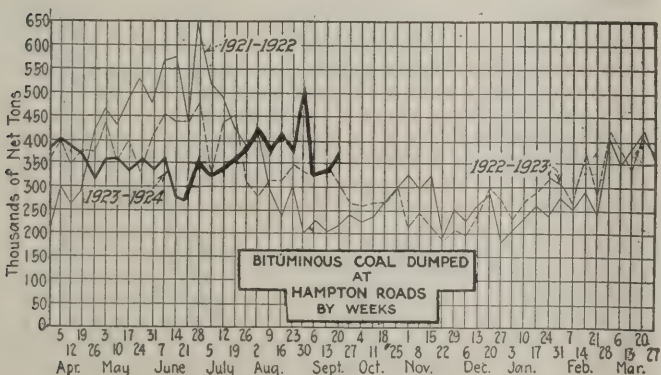

Twenty coal firms submitted bids on Sept. 21 to the U. S. Army Quartermaster's Department, Brooklyn, for furnishing and delivering 14,115 net tons of bituminous 2-in. lump coal to various army posts, forts and arsenals in Virginia and Maryland and to the Middletown (Pa.) Air Intermediate Depot. The prices submitted ranged from \$2.04 to \$3.50 f.o.b. mine, according to quality and analysis of coal. For furnishing and delivering forty net tons of smithing coal to Fort Hoyle, Maryland, eight bids were received, the prices quoted ranging from \$2.48 to \$3.50 per ton, f.o.b. mine.

THE INTERSTATE COMMERCE COMMISSION began Sept. 24 at Pittsburgh an investigation of the reasonableness of anthracite transportation rates. The investigation is being conducted by Bell Disque, one of the veteran examiners of the commission.

Foreign Market And Export News

Greco-Italian Crisis Aids British Coal Market; Foreign Inquiries Stronger

While the South Wales coal market has been irregular, the outlook is regarded as optimistic. After the slackness of the last three months and the big drop in prices, operators believe that values have touched rock-bottom levels, and that there will be a recovery of at least several shillings per ton during the next few weeks. Some pits have stiffened quotations for delivery in the middle of September and over the remainder of the year.

The Greco-Italian crisis has also aided the market. Welsh anthracite pits are well booked up to the end of the year. Inquiries are stronger from Canada, the United States, and Italy is buying more freely.

The Newcastle market is firm, influenced by the Italian crisis and the outlook and business is much brisker than for some months, steam and gas coals being in good demand.

Coal output for the week ended Sept. 8, accordingly to a cable to *Coal Age*, was 5,320,000 tons, an increase of 40,000 tons from the previous week.

French Coal Production and Imports

Coal production in France during July, according to statistics recently made public, amounted to 3,148,169 metric tons of coal and 66,653 tons of lignite, as compared with 3,254,903 tons of coal and 70,873 tons of lignite in the previous month. During the same period the output of coke was 178,427 tons in July, and 161,132 tons in June. Production of coal and coke in the non-devastated mines of the Arras district in July was 749,198 metric tons and 39,336 tons respectively, as compared with 792,738 tons of coal and 39,119 tons of coke in the previous month. The devastated mines of the Pas-de-Calais and of the Nord produced 974,502 tons of coal and 79,354 tons of coke in July, a decrease of 18,525 tons of coal and an increase of 9,924 tons of coke when compared with the month of June.

According to the French Information service of the Bankers Trust Co. of

New York, French coal imports during the first half of this year amounted to 12,353,000 tons as compared with 11,335,000 tons during the corresponding period of last year. Of this tonnage the United States furnished 298,000 tons and Great Britain 9,025,000 tons, as compared with 19,000 and 5,966,000 tons, respectively, during the same months of 1922. Coke imported into France during the same period totaled 1,700,000 tons, as compared with 2,429,000 tons in 1922.

Hampton Roads Market Slow

Business at Hampton Roads was unusually slack last week. Export trade fell off materially, and coastwise business showed a decrease. Bunkers trade alone held its own, while movement at the piers was slower.

After effects of the strike were held responsible for the slack trade, consumers having stored large quantities in anticipation of protracted interruption of mining. Shippers, however, expected a revival in trade in about two weeks.

Prices were weak, good coal being available at considerably below \$5 for the first time in many months. The tone of the market was exceedingly dull.

Coal Paragraphs from Foreign Lands

All coal imported into Greece from countries not enjoying the conventional tariff rates of Greece will hereafter be dutiable at 15 gold drachmas per ton, according to a decree published in the Official Greek Gazette of June 23, 1923. Under the conventional tariff coal is exempt from duty. The conventional rates apply to goods from the United States, Consul J. G. Erhart states in a report to the Department of Commerce.

Swedish coal mines in Spitzbergen, according to estimates, will this year produce about 80,000 tons of coal. A fleet of Swedish colliers has been busy bringing the coal to Sweden.

Imports of coal at the port of Hong-kong for 1922 amounted to 1,048,175 tons, as compared with 1,175,871 tons for the previous year, and 1,018,870 tons in 1920, according to Consul Leroy Weber, at Hongkong. About 75 per cent of the bituminous coal is imported from Japan and the remainder comes from China. All of the anthracite, which makes up only about 10 per cent of the total imports, comes from French Indo-China. Nearly 25 per cent of the total imports is re-exported to nearby ports for use by small steamers, launches and manufacturing plants.

News Items From Field and Trade

ALABAMA

One thousand acres of coal lands at Tidewater, Tuscaloosa County, has been acquired by F. W. Hopkins, J. W. Lewis and others. These lands are on the Warrior Southern R.R. and also adjacent to the Warrior River, making both water and rail transportation available. It is understood that the property will be developed extensively at an early date by the new owners, who are experienced operators in the district. There are at present a large number of tenant houses on the property available for the use of employees, situated on the Vandergraft tract, which is included in the acreage transferred.

After three years of idleness Mine No. 1 of Townley was recently put into operation. The daily output of this newly equipped mine will be about 2,000 tons or more. The Corona Coal Co. has spent an immense sum of money in repairing mine No. 1 with which mine No. 2 has been consolidated under ground. Townley No. 1 is said to be one of the best equipped mines in northern Alabama.

The Stouts Mountain Coal Co., which has been operating a mine near Hanceville, Cullman County, for a number of years, has closed down the mine and removed live stock and other transferable equipment. No reason for suspension was assigned. The mine has been operating on a basis of two to three days per week for some time.

The little town of Carbon Hill, a coal-mining centre in Walker County, experienced a disastrous fire Sept. 10 which destroyed seven of its principal mercantile establishments, entailing a loss of about \$45,000. All were frame structures.

COLORADO

To imbue its men with a realization of the value of first-aid training the Colorado Fuel & Iron Co. has posted the following circular in its mines: "Prompt First-Aid Treatment Saves Man's Life.—Joe Gurule, a nipper on one of the mine motors at Frederick mine, came in contact with the trolley wire on Aug. 27, losing consciousness immediately. John Arbo, motorman, who had first-aid training, began working on him. Robert Brownrigg and Luke Egan, also experienced in first-aid work, reached Gurule in a short time and the three worked on him until the arrival of Dr. Seyfarth from Segundo. The Doctor was taken into the mine and used the inhalator for resuscitation. Gurule was unconscious for 5 hours and 20 minutes and Dr. Seyfarth, stated that without doubt, had it not been for the very excellent work of Arbo, Brownrigg and Egan, the boy would have lost his life. These men deserve much credit for their knowledge of the right thing to do at the right time. Certainly this points out the real value of first-aid training."—D. A. Stout, Manager.

The Prairie Canon mine, a slope operation of the Prairie Canon Coal Co. at Vallorso, Las Animas County, has reopened after a shutdown which began Feb. 1, 1923.

ILLINOIS

What is said to be the record lump of coal mined at No. 2 mine of the Bell & Zoller Co., Ziegler, is 11 ft. long, 5 ft. 8 in. high and 4 ft. 8 in. wide, and weighs more than eleven tons.

The Board of Education of Peoria has awarded a contract for approximately 6,000 tons of 14-in. lump coal and 2,500 tons of 14-in. screenings to the LeMarch Coal Co., Peoria. The LeMarch bid was \$3.85 per ton for the lump coal and \$2.25 for the screen coal.

Aug. 11 was observed as a holiday at the general offices of the Sullivan Machinery Co. at Chicago. On that day the new western works of the company at Michigan City, Ind., was formally opened and manufacturing begun. The buildings were completed some time ago, and during the past month the machinery and equipment have been moved from the company's old plant at Chicago to the new quarters. The general office force and officials of the company, members of the board of directors, the company's bankers, railway officials and

others spent the day at Michigan City inspecting the new plant.

The Chicago Coal Merchants' Association at a meeting held recently, voted to stand behind the new city ordinance providing for public weighmasters, designed to curb short-weighting under the double delivery ticket system. The association also went on record as favoring an intensive advertising campaign to let the public know what the members are doing to check fraud. Building materials men have contested the legality of the ordinance and have obtained an injunction against its enforcement. The ordinance provides that all deliveries of coal and other bulk commodities be weighed by a public weighmaster and that official seals be placed on the weighing tickets to designate the correct weight and as a safeguard against short-weighting. Delivery of the ticket must be made before the coal or other commodity is unloaded. The coal dealers, in voting for the ordinance, gave the president, L. W. Ferguson, and the board of directors of the Chicago Coal Merchants' Association authority to take such action as may be wise in setting aside the present injunction restraining the enforcement of the law. Regardless of the result of the test case, a large number of the coal men will continue the weighing of coal by a public weighmaster and the issuance of a delivery ticket with an official seal, it was declared.

Six teams took part in a first-aid contest held at Belleville Sept. 3 by Joseph A. Holmes Safety Chapter 59, sponsored by the F. J. Boetcher & Son Coal, Coke & Mining Co. and J. J. Guest, of the B. B. Coal & Mining Co. A handsome silver loving cup was presented as a trophy by W. M. Hoppe, of the Continental Casualty Co., and there also were cash prizes. The cup for the best first-aid team was won by B. B. Coal & Mining Co. team No. 1, with a score of 298, Capt. Chas. Goring; second place by B. B. Coal & Mining Co. team No. 2; third place, Avery Mine team, of Son. Coal & Mining Co., fourth place by Shiloh mine team of Son Coal & Mining Co.; fifth place by Quality mine team of Quality Coal & Mining Co. and sixth place by Radium mine team of Aluminum Ore Co.

The following report has been made public by Edward Flynn, mine inspector of Perry County, for the fiscal year ending June 30, 1923: Total tons produced, 2,267,421; total men employed, 3,923; total number shipping mines, 20; total number wagon mines, 15; total all mines, 35. The Majestic Coal & Mining Co., of Du Quoin, heads the list of producers with a total of 339,175 tons; the Paradise Coal Co. follows with 280,930 tons, and the Security Coal & Mining Co. comes next with 187,628 tons, both the latter mines located at Du Quoin, also. The Scott-Smith Coal Co., of Du Quoin, operating a strip mine and employing only 49 men, shows a remarkable record, standing sixth in the list with the other mines which employ from 300 to 500 men.

James P. Hickey and W. M. Ryan, both of Springfield, who are interested in the Prairie State Coal Co., have purchased a mine at Pontiac and have organized a company to handle the operation. The name of the new company is the Pontiac Coal Mining Co. H. H. Webb is president. Other officers are: Cass Fremgen, vice-president and general manager; James P. Hickey, treasurer; W. M. Ryan, secretary. The Prairie State Coal Co. will distribute the output.

Colonel Samuel N. Hunter, of Du Quoin, who is widely known through his connections with the Herrin massacre of last year, has been reported as a candidate for the Republican primaries as Lieutenant Governor. It is stated that he has the support of Frank Farrington, president of the Illinois miners union, and of John H. Walker, president of the Illinois Federation of Labor.

News of the purchase of the Victory Collieries Co. mine at Tamaroa by the Chicago Coal Co., Chicago, has been made public. The value of the mine is approximately \$200,000. The Chicago Coal Co., a new concern, is headed by Edward J. Hartenfeldt, president, formerly connected with the Aladdin Coal Co., which company operated several mines at Tamaroa and Pinckneyville until a few months ago.

A Herrin massacre suit—that of the Southern Illinois Coal Co., owner of the

strip mine which was damaged at the time of the Herrin riot of June, 1922, against the County of Williamson for damages—cannot be held outside of Williamson County. Circuit Judge Somers at Harrisburg, in Saline County, denied the petition for a change of venue. The company claimed it couldn't get a fair trial in Williamson County and the judge held that, in view of the notoriety Williamson County had received, a fair trial couldn't be had anywhere else.

INDIANA

The Southwestern Indiana Coal Corporation, Evansville, has been incorporated with a capital of \$200,000 to mine and deal in coal; directors, William F. Quarrie, Frederick E. Reeve, Tom J. Phillips, Loris G. Julian and L. C. Oliver.

The Rader Coal Co. of Indianapolis, capitalized at \$100,000, has been incorporated to deal in coal and other materials. The incorporators are: C. L. Rader and C. E. Henderson, both of Indianapolis, and James H. Persons, of Terre Haute.

Eight Gibson County coal miners who were convicted of connection with the Francisco mine riots of June, 1922, and sentenced but who appealed to the state board of pardons for relief from their sentences, were denied clemency by Governor McCray and the board, it has just been announced. Each of the miners was sentenced to serve three months on the State Farm and fined \$100 and costs. The miners were Vivian White, Arville Duke, Joseph A. Vickers, Frank Bolin, Roscoe Erwin, Hamilton Erwin, Bert Dowd and Lawrence Evans.

KANSAS

A new coal plant for Hutchinson is to be built by the Rock Island, according to an announcement made by R. R. Bragg, division engineer at Pratt. The present coal plant at Hutchinson is to be replaced by a 300-ton plant, one of the largest of its type on the system in Kansas. The Pratt plant now has 200-ton capacity.

KENTUCKY

The first coal operation to produce coal on the new main line of the Illinois Central Ry., which is approaching completion of the stretch between Madisonville and Dawson Springs, will be the Dawson Daylight Coal Co., a combined open-work and underground operation. The shovel equipment of this company will consist at the outset of three Bucyrus revolving shovels. The Morrow Manufacturing Co. is building the machinery for a tippie and for conveying coal from the concrete hopper which will receive it from the mine cars. The tippie and the track facilities will be constructed to handle 50 to 60 cars per day. The property of the company consists of about 1,400 acres owned in fee and containing four seams of coal, all of which are strippable over considerable areas. Construction is in charge of W. J. Borries, general manager.

The Denmark Coal Co., Madisonville, Hopkins County, Ky., capital \$20,000, has been chartered by Wayne Plym, J. C. Hurt and R. P. Cox, all of Madisonville.

The Green River Fuel Co., of Mogg, has increased its capital stock from \$20,000 to \$75,000.

MASSACHUSETTS

The establishment of "coal savings funds" similar to Christmas and vacation savings clubs, and the co-operation of employers with their employees in temporarily financing the domestic supply of coal, are among the recommendations of the Western Massachusetts Coal Storage Committee of the Federated American Engineering Society.

Governor Cox again has urged Governor Pinchot to effect the repeal of the Pennsylvania tonnage tax on anthracite which raises the cost 15c. a ton. He also asks legislation fixing quality and size to protect the public.

The Joint Special Coal Investigating Committee of the Massachusetts Legislature in a recent statement says "The anthracite industry is like a spoiled child. Every time it frets we toss it candy. Let us quit this practice. Let us give it the spanking which it deserves. You and your neighbors, if you insist on having anthracite regardless of the price and will take nothing else, are to blame for the high price of anthracite. The remedy is to establish in New England a competitive market for domestic fuels by turning from anthracite to other fuels and learning how to use them and, should there be further increase in the price of anthracite, by instituting a boycott or buyers' strike against anthracite."

MISSOURI

The Lingo Coal Co. has been incorporated at Kansas City with a capital of \$35,000. The company will mine and sell coal at wholesale and retail. The incorporators are H. G. Kellogg, D. L. Sprecher and M. E. Morris.

Harry N. Taylor, formerly vice-president of the Central Coal & Coke Co., and Mrs. Gertrude Coumbe, formerly of Kansas City, were married recently in New York, where Mr. Taylor is now president of the United States Distributing Corporation.

The Mosby Coal Co. plant at Mosby, has been leased by the Centerville (Ia.) Coal Co. and steps will be taken at once to start production. The Mosby company has had a checkered career, much difficulty being experienced with quicksand that threatened many times to engulf the enterprise, but successful operation now seems to be assured.

NEW JERSEY

Governor Silzer in a letter to Governor Pinchot calls upon the Pennsylvania executive and the federal government to see to it that settlement of the coal strike does not result in further gouging of the consumer. In his letter Governor Silzer says that "In 1921 Pennsylvania imposed a tax of 1½ per cent on coal, and openly admitted that its purpose was to make the coal consumer of neighboring states pay the running expenses of Pennsylvania. At a price of \$9 a ton this tax would be 13½c. a ton, but what did you do to our neighbors? The Pennsylvania Fuel Commission ruled that 50c. a ton be added to the mine price on account of the state tax and expenses incidental. If you take off this tax, it will practically equalize the 60c. added by the strike settlement. We will hold the dealers down if Pennsylvania and the federal government will do their full duty, having in mind, however, that the added 60c. came from the settlement and not from the dealers."

OHIO

The Fearn-Hirst Co., Canton, has been chartered with a capital of \$10,000 to mine and deal in coal and coke. The incorporators are E. E. Fearn, Margaret Fearn, Ida Hirst, C. A. Hirst and Frank Jones.

The Peabody Collieries Co., of Cleveland, has been incorporated with an authorized capital of \$10,000 to mine and deal in coal at wholesale. Incorporators are C. H. Brown, Hugh Younger, James B. Dolphin, Catherine Stelker and E. E. Thiele.

The Reilly Coal Mining Co., Cleveland, has been chartered with a capital of 500 shares of no par value, designated to mine coal and also to do a general jobbing business. Incorporators are Read McKuhns, Roland R. Foley, Elmore L. Andrews, Thomas E. Lipcomb and Stanley L. Orr.

Armour Sizer has been appointed Western sales manager of the Flat Top Fuel Co. with headquarters in Cincinnati, taking the place of Victor White, who died last month. Mr. Sizer is a native of Bluefield and is familiar with the company's operations through having been associated with Mr. White for several years.

PENNSYLVANIA

The Cranberry Creek Coal Co. has started removal of twenty houses from Old Cranberry to a new location, to make room for a big anthracite coal stripping.

Former Mine Superintendent T. C. Davis, of the Rainey plant at Mount Braddock, was recently presented with a \$125 fine gold watch, and his wife with a \$75 silver set, by the employees of that plant. The Oliver & Snyder Co. has engaged Mr. Davis in a position similar to the one he had held at Rainey's. Mr. Davis is a member of the North Union School Board.

The universal eight-hour day at the mines and collieries in the anthracite field has already caused a controversy about the carpenters employed on the remodeling of the Sandy Run breaker of the M. S. Kemmerer Co. The mine workers' committee at the colliery posted a notice which stated that carpenters should quit when their eight hours were up or the entire job would be tied up, contending that the carpenters are members of the miners' union and have no right to work more than eight hours a shift. Although the company has not conceded their demands, those who do not want to work ten hours have been given the right to quit at four o'clock.

The Pennsylvania Federation of Labor has purchased a private residence, with

complete furnishings, to be used as offices. The building is located near the Capitol at Harrisburg, and federation offices will be moved there in the immediate future.

Of the 216 fatal accidents reported to the State Workmen's Compensation Bureau during the month of August, 93 were in the mines of the state, 85 in other industries and 38 in public-service operations. There were 18,668 accidents reported for the month, the highest number reported since August, 1917. The bureau during the month approved agreements to pay compensation in 158 fatal cases, 301 permanent disability cases and 6,974 temporary disability cases, making a total of 7,433 cases. The total amount of compensation paid during August amounted to \$745,872.

A state charter has been issued to the Camp-Osgood-Sleppy, Inc., of Scranton, at Harrisburg. The corporation's purpose is mining, buying and selling coal, and its capital stock is \$100,000. The incorporators are Byron W. Sleppy, Kingston, treasurer; Irving L. Camp, Johnstown, and William J. Osgood, Bird Mill, Wellesley Hills, Mass.

The Rupert Coal & Coke Co., Pittsburgh, has been incorporated, its purpose being mining, producing, buying and selling coal and coke. The company's capital is \$25,000 and the incorporators are Wayland Rupert, Pittsburgh, treasurer; S. N. Birney and H. C. Henderson, Pittsburgh.

The Watson-McManigle Coal Co., Franklin, has been incorporated, its capital being \$10,000. The purpose of the company is to mine, produce and market coal and its products. The incorporators are Florence A. Watson, Franklin, treasurer; J. Howard Watson and Alexander C. Sheasley, Franklin.

Richard W. Gardiner, formerly chief accountant of the Federal Trade Commission and for the past six years commissioner of the Pittsburgh Coal Producers' Association, has opened an office for the practice of accounting in Room 241 Oliver Building, Pittsburgh. Special attention will be given to cost system and statistical work for coal operators.

The Dorr Co., engineers have removed their office from Scranton to Wilkes-Barre, where they will be located in the Miners Bank Building. The company has offices in New York, Denver, and London, England. John Griffin, who was in charge of the Scranton office, will continue in charge of the Wilkes-Barre office.

C. S. Goldborough, president of the Pennsylvania Coal Co., has reappointed Frank H. Coughlin, of Dunmore, as assistant to the president, which position Mr. Coughlin held during the presidency of the late Captain William A. May. In addition to his other duties Mr. Coughlin will serve as purchasing agent for the company and will have as his assistant F. W. Hess, of New York, who has been with the company a number of years, and will remove his headquarters to Dunmore.

Shipments of anthracite during August, 1923, as reported to the Anthracite Bureau of Information, Philadelphia, amounted to 6,672,855 gross tons, as compared with 6,260,053 tons during the preceding month of July, an increase of 412,802 tons or 6.6 per cent. Comparing last month's shipments with August, 1921, when 5,575,115 tons were shipped to market, an increase of 1,097,740 tons is recorded, or 19.7 per cent. The shipments last month established another record for August, which was only exceeded during that month in the years 1917 and 1918, when maximum shipments of over 7,000,000 tons were made. Shipments by originating carriers were as follows:

	August 1923	July 1923
Phila. & Reading....	1,277,770	1,155,701
Lehigh Valley	1,154,004	1,124,400
Jersey Central	496,725	494,254
Del., Lack. & Western	1,004,507	965,446
Delaware & Hudson..	943,143	879,772
Pennsylvania	555,064	520,423
Erie	759,711	661,120
N. Y., Ont. & Western	154,586	152,543
Lehigh & New Eng...	327,345	306,394
Totals	6,672,855	6,260,053

Officers of the United Mine Workers of Districts 1, 7 and 9, have sent circular letters to the local unions refuting charges against John L. Lewis, international president, which accuse him of insincerity in the demands of the anthracite mine workers. The letter states that a circular containing these charges was now being distributed in the anthracite region by representatives of the "progressive international committee," a dual labor organization antagonistic to the principles of the United Mine Workers.

TENNESSEE

Petition for charter has been filed by the Eagle Coal Mining Co. at the office of the County Court clerk at Knoxville. Incorporators are J. E. Wood, J. H. Hodges, W. A. Montgomery, H. O. Bales and O. J. McNeil. Mining operations will be started near Oliver Springs in the near future. Capitalization is \$25,000.

UTAH

Three townships in Carbon County, embracing some of the most valuable developed coal properties in the state, have been withdrawn from entry in order to permit a resurvey of the area, through an executive order signed by President Coolidge. The camps of Standardville, Storrs and Helper are located in the withdrawn townships, but land already filed is not affected.

The Black Diamond Fuel Co. has incorporated at Salt Lake City for \$1,000,000. It is formed to take over property in Carbon County which Ezra B. Jones is lessee. The officers and incorporators are W. E. Hubbard, president; J. B. Lamb, vice-president; Bruce M. Loos, secretary-treasurer; John Cain and H. White additional directors.

VIRGINIA

J. Cloyd Byars, formerly a well-known figure in the coal trade, probably will be a candidate for a position on the State Corporation Commission of Virginia in the November elections, it is announced. He is a native of Arlington County and has served in the State Senate.

Foundation work has been completed and construction of the steel framework of the new \$3,000,000 coal pier of the Virginian Ry. at its Sewells Point terminal, here, began Sept. 24. The contract for the work has been placed with the Bethlehem Steel Co. This addition to the coal handling equipment of Hampton Roads will be the most modern of its kind in the country, officials said. It will have a capacity of dumping over 70,000 tons of coal every 20 hours, and will be able to accommodate 6 vessels alongside the chutes at one time.

WEST VIRGINIA

L. C. Hutson, in charge last year of mining extension work in the Mt. Hope District of West Virginia has accepted the position as assistant director of the mining department of Maryland.

The Erbacon Gas Coal Co. has been organized to mine coal in the Monongalia field, headquarters of the company to be at Morgantown. This company is capitalized at \$25,000. It was organized by A. Carl Slagle, P. C. Kiernan, Paul Kiernan, William Coburn and Charles C. Baker, all of Morgantown.

E. E. Criswell, former head of mining extension work in the Beckley district, has resigned his position as such to go with the New River company at Mt. Hope as editor of the magazine published for employees.

Announcement has been made that so far as mining extension work in southern West Virginia is concerned the Mt. Hope and Beckley districts will be consolidated under one head. Resignations of several instructors of former years necessitated the consolidation. R. H. Magee, mining extension instructor from the University of West Virginia, will take the place of E. E. Criswell former head of the Beckley district, and of L. C. Hutson, in charge last year of the Mt. Hope district. Mr. Magee expects to visit Glen Jean, Mt. Hope, Minden, Stanaford, Skelton, Price Hill, Summerlee, Carlisle, Pax, Glen White, Helen, Cranberry and a number of other places within a short time and organize his classes for the present year. It will be necessary to consolidate the classes, as Mr. Magee will be unable to conduct more than six at one time.

Preparations are being made by Robert Talbott & Co., of Fairmont, to develop a large tract of Sewickley coal land in the vicinity of Arnettsville, in Monongalia County. Soon after operations are begun it is expected that it will be possible to produce coal at the rate of between 1,200 and 1,500 tons a day. The coal land to be developed is on Indian Creek and is made accessible through the Indian Creek & Northern R.R., a subsidiary of the Baltimore & Ohio. It is proposed to sink an air-shaft and to drive a slope opening of about 500 ft. in order to reach a seam about 7 ft. thick. Preparations are under way for the erection of a modern tippie with shaker screen and other equipment for preparation.

Defective wiring is thought to have been responsible for starting a fire which destroyed a company boarding house and a double dwelling on the property of the Gay Coal & Coke Co., one of the pioneer companies in the Logan field. The loss is estimated at \$10,000.

Phil Williams and others of Elkins, have effected a preliminary organization of the **Roaring Creek Coal Co.**, which has just been granted a charter to operate in the Roaring Creek field of northern West Virginia. Though the office of the company will be at Elkins, the company will have its mine near Norton. The Roaring Creek company has an authorized capital of \$50,000.

Howard R. Harrah, foreman of the jury which disagreed in the murder accessory trial of William Blizzard, was convicted in Lewisburg, Sept. 20, of taking \$600 from **G. C. Hickey** union man and defense witness. The maximum penalty—six months in jail and a fine of \$500—was pronounced on Harrah Sept. 22. Notice of an appeal was given and Harrah was placed under bond. Judge Sharp overruled a defense motion asking that the verdict be set aside. Hickey was tried and found guilty of bribery Sept. 21 and released under bond. His bond was forfeited when he failed to appear in court where summoned Sept. 22.

Dan R. Lawson, of Fairmont, has resigned as manager of sales of the Appalachian Fuel Co., effective at once. During the war Mr. Lawson was district representative of the United States Fuel Administration for the Fairmont region.

A new steel tippie which is in course of construction at the mines of the **E. E. White Coal Co. at Glen White, W. Va.**, will soon be completed. A steel tower, 200 ft. high, has been constructed and slipped into place, replacing a wooden structure, with the loss of only a few hours' work. When improvements at Glen White are completed the company will be able to materially increase its daily capacity.

In accordance with the provisions of Senate Bill No. 348 creating "The West Virginia School of Mines," of which Senator A. L. Helmick, of Tucker County, was the patron, **Governor E. F. Morgan on Sept. 17 announced the personnel of the commission** which will determine where the school shall be located. Senator Helmick has been named as a member from the Senate; S. R. Garvin, of Mt. Hope, as the representative of the House of Delegates; V. E. Sullivan, of Charleston, as representative of the Department of Mines; Ira Marks of Flemington, as representative of the miners, and Walter H. Cunningham, secretary of the West Virginia Coal Association, as a representative of the operators. The commission will be required to report to the next Legislature whether in its opinion the school shall be carried on as an independent institution or in connection with one or more of the present existing educational institutions of the state. The new law provides that the school of mines shall contain departments of mining engineering, mining extension, mining geology and chemical engineering as well as the mining experiment station already authorized by the mining laws of the state.

New shaker screens, picking tables, loading booms and all the latest mechanical inventions to insure efficient preparation of coal have just been installed at Rachel Mine, Downs, near Fairmont, and Frances Mine, at Cresaps, near Moundsville, on the Baltimore & Ohio R.R. by the Bertha-Consumers Co., of Pittsburgh, Pa. All mines now operated by this company have been similarly equipped.

The repair shops of the **E. E. White Coal Co.** at Stotesbury, were recently destroyed by fire entailing a loss approximating \$100,000. A new and modern structure will replace the one destroyed.

J. W. Dawson has been elected vice-president in charge of operations of the Main Island Creek Coal Co. and will have his headquarters at Omar. Until recently Mr. Dawson was in California engaged in railroad-building enterprises, but came originally from West Virginia.

The suit of the **Norfolk & Western Ry.** against fifteen coal shippers with offices at Norfolk, to collect demurrage charges alleged to be due, will be called again in the City Circuit Court during the first week in October. The suit is based on different methods of computing demurrage, the shippers' figures based on their method being considerably lower than the railroad's figures. The railroad has agreed to accept the amounts computed by the shippers in part payment of the charges, and the remainder will be made the subject of litigation. Approximately \$500,000 is involved in the suits.

WISCONSIN

Governor Blaine, in a letter to Gov. Pinchot of Pennsylvania, declared that "not one cent of the increase in wages granted to miners should be passed on to the consumer, and until the federal government effectively deals with the coal mines and their operations, state efforts will effect small relief, if any, to the consumer." The Wisconsin Governor was replying to a request of Governor Pinchot that state executives act to prevent coal price "gouging."

WASHINGTON

The Bureau of Mines reports that sales of explosives throughout the United States in July, 1923, amounted to 516,785 kegs of black blasting powder, 4,177,832 lb. of permissible explosives, and 16,758,927 lb. of other high explosives. Each of these figures represents a large increase over sales in July, 1922, and 1921. The figures are based upon reports from manufacturing companies whose yearly sales represent 85 per cent of all black powder used in the United States, 88 per cent of all permissibles, and 81 per cent of all other high explosives. The July sales of black powder brought the total sales of this class of explosives during the first seven months of 1923 to 4,159,878 kegs. Of the total sales in 1923 to date, 84.8 per cent were for use in coal mining, 2.8 per cent for other mining, 5.6 per cent for railway and other construction work, and 6.8 per cent for miscellaneous purposes. For each thousand tons of coal mined since Jan. 1, 378 lb. of explosives were used, of which 239 lb. were black powder. The quantity of permissibles sold in 1923 to the end of July was 33,304,984 lb. The 1923 sales were for use as follows: Coal mining, 96.5 per cent; other mining, 0.8 per cent; railway and other construction work, 0.3 per cent; miscellaneous purposes, 2.4 per cent. For each thousand tons of coal produced since Jan. 1, 33 lb. of permissible explosives have been used. Sales of high explosives other than permissibles in 1923 to the end of July amounted to 131,914,873 lb. Coal-mining operations consumed 16.7 per cent of the amount sold from January to July 1923; other mining work used 35.3 per cent; 12.4 per cent was for railway and other construction work; and 35.6 per cent was for miscellaneous purposes.

E. Foster Bain, director of the U. S. Bureau of Mines, has resumed his duties in Washington after an absence of more than two months during which he assisted the Department of Commerce in its inquiry into nitrate export conditions in Chile. The inquiry in which Director Bain assisted is one of a number of subjects undertaken by direction of Congress to determine the effect of foreign control on commodities for which the United States is largely dependent upon imports for its supply.

Chairman John Hays Hammond of the U. S. Coal Commission and other members of the Commission gave a reception to the members of the Commission's staff of employees, Sept. 22, from 5 to 7 p. m. at the residence of the chairman, 2301 Kalorama Road.

CANADA

The possibility of developing Alberta coal fields to compete with American anthracite fields has been abandoned as impossible because of geographical conditions and the length of the necessary haul according to J. E. Dalrymple, vice-president of the Canadian National Ry. As a result, he said, the experimental low rates on the railway, proposed some months ago by Sir Henry Thornton, also have been abandoned.

Charles Stewart, Canadian Minister of the Interior and Mines, states that briquetting operations at Bienfait, Sask., which have been costing \$8,000 per month, have passed the experimental stage and that the experts of the Mines Department believe that it would be advisable to commence the making of lignite briquets in commercial quantities. This will be done as soon as possible. The serious difficulty which has developed is the withdrawal of Manitoba, which refuses to continue its contribution toward the cost. Hitherto the charges for experimenting have been divided between the Dominion, the Saskatchewan and the Manitoba governments and have cost Manitoba in all \$230,000 without return for the outlay. W. R. Chubb, Manitoba Minister of Public Works, adheres to his position as regards withdrawal from the enterprise, and Manitoba will turn over its part of the equipment to the Federal and Saskatchewan officials.

The British Empire Steel Corporation, it has been announced, plans to put into operation the battery of coke ovens erected two years ago at its Sydney (N. S.) plant by the Koppers Corporation. These ovens have been idle since their erection, the company obtaining a sufficient supply of coke from the other two batteries constructed early in the war years. There are 120 ovens in operation at the British Empire plant at present, and according to present plans eighty more will be put into operation. With this extra production the company hopes to be able to supply the upper Canadian market with coke for domestic use. Another blast furnace is to be blown in at the plant within the next few weeks. At present three furnaces are operating, but not since the war has the company operated four.

The East Kootenay Mine Safety Association of British Columbia held its Fourth Annual Mine-Rescue and First-Aid Meet in Michel, Aug. 25, when seven teams entered for the mine-rescue events. Three of these teams represented Coal Creek Colliery, using the Gibbs rescue apparatus, two represented Michel Colliery, using the Draeger apparatus, one team from Bellevue and one from Lethbridge, both of which used the Proto rescue apparatus. Following is the result of the mine-rescue contest: First, Coal Creek No. 1 team, 97.8 per cent; second, Michel No. 2, 96.4 per cent; third, Fernie No. 1, 95.4 per cent; fourth, Michel No. 1, 92.8 per cent; fifth, Fernie No. 2, 92 per cent; sixth, Bellevue, 89.6 per cent; seventh, Lethbridge, 88.1 per cent. Six teams took part in the first-aid contest, with the following result: First, Fernie, 97.25 per cent; second, Michel No. 1, 96.25 per cent; Lethbridge and Bellevue tied for third place, 92.25 per cent; fifth, Michel No. 2, 90 per cent; sixth, Coal Creek, 89.25 per cent.

EXPERIMENTAL MINE, EAST KOOTENAY MINE SAFETY ASSOCIATION, MICHEL, B. C.

Obituary

Paul J. Rainey, a director of W. J. Rainey, Inc., big game hunter, explorer and motion picture photographer, died on the steamship Saxon en route from Southampton to Cape Town and was buried at sea Sept. 18, according to a radio message received at the office of the Rainey company in New York City. Mr. Rainey, who was forty-six years old, was born in Cleveland, the son of the late W. J. Rainey, known as "the coke king." He was unmarried. When in this country he divided his time between New York and Mississippi, where he had a big farm. He had a worldwide reputation as an explorer and hunter of big game. His brother, Roy Rainey, is chairman of the board of W. J. Rainey, Inc. He also left a sister, Mrs. Grace Rainey Rogers.

Association Activities

A number of operators were in Louisville on Sept. 11 for the monthly meeting of the **West Kentucky Coal Bureau**. The meeting was given over to traffic and car-supply matters principally, along with statistical reports concerning operating time of the field, and causes for slow operation. Among those at the meeting were Frank D. Rash of the St. Bernard Mining Co., Earlington; A. W. Duncan, Duncan Coal Mining Co., Greenville; W. A. Wickliffe, of the Greenville Coal Co., Greenville; N. E. Jones, of the Southland Coal Co., Henderson; P. D. Berry, of the Providence Coal Mining Co., Providence; Brent Hart, of the Hart Coal Corporation, Mortons' Gap; M. B. and Sterling Lanier, of the Norton Coal Mining Co., Nortonville; J. D. Overall, of the Reinecke Coal Mining Co., Madisonville; H. L. Tucker, of the Rockport Coal Co., Rockport, Ky.; George S. Miles, of the Gibraltar Coal Mining Co., Memphis; Alex Blair, of the Pittsburg Coal Co., Basket.

The feature of the weekly meeting of the **Columbus Coal Bureau** held Sept. 17 was a talk by Frank H. Tanner, secretary of the Ohio Millers Association, on the problems which confront farmers and millers. Mr. Tanner also told of the fuel used by a majority of mills and said that coal was far in the lead, although some fuel oil, gasoline engines and natural gas was used. Several new members were received. The asso-

ciation together with a number of coal men of central Ohio had an outing at Spring Lakes, near Columbus, Sept. 20 with about 100 present. A number of guests from outside of the state were present. T. C. Collins, C. M. Anderson, B. F. Nigh, Homer Gill, F. W. Braggins and Leo Roberts composed the committee on arrangements.

Traffic News

Assurance that the **Southwest will not suffer from coal-car shortage this winter** was given in Kansas City the other day by J. B. Campbell, agent for the car service division of the American Railway Association in the Southwest. "Cars required by the coal mines the week ending Aug. 18 numbered 11,137 in the Southwest and we furnished 11,233 cars, or 101 per cent," Mr. Campbell declared. "A survey of car surpluses and car shortages from Aug. 15 to Aug. 22, showed a surplus of 527 cars in the Southwestern district ready for hauling."

Fewer freight cars were in need of repair on Sept. 1 this year than on any date since November, 1920, according to the Car Service Division of the American Railway Association. The total on Sept. 1 was 175,327, or 7.7 per cent of the number on line. This was a decrease of 13,308 cars since Aug. 15, at which time there were 188,635 or 8.2 per cent.

The Mid West Retail Coal Association, St. Louis, Mo., has written the Interstate Commerce Commission, protesting against the second postponement to Nov. 1 of the effectiveness of the decision abolishing assigned cars. "October is, one of the months in which coal cars are short," says the letter. "This shortage creates an unusual demand for coal, which is taken advantage of by unscrupulous shippers and jobbers to raise the price of fuel to dealers and steam plants and in many instances the increase is carried on to the general public. It has always been an unjust and unreasonable method of distributing cars and it is a matter of sincere regret to the members of this Association and its officials that the public must continue to suffer, and there is no adequate remedy up to the present for the evil excepting that of a promise that has yet to be fulfilled by your Commission. The contention made in the press of the country that the special interests are still the favored seems to be well maintained."

Issuance of \$1,000,000 additional capital stock by the Greenbrier & Eastern R.R., sanctioned by the Interstate Commerce Commission, means additional development of the smokeless coal resources of the Greenbrier field of West Virginia. The Greenbrier & Eastern is operated between Marfrance in the western part of Greenbrier County and Greenbrier & Eastern Junction, where the road connects with the Sewell Valley R.R. That road in turn connects with the main line of the Chesapeake & Ohio and furnishes an outlet for the coal mined in the Greenbrier field. Since the Greenbrier & Eastern was opened to traffic there has been rapid development of the Greenbrier coal field, especially at Quinwood, where several mines are operating and producing smokeless coal.

Double tracking of the Norfolk & Western on the Big Sandy Division is in prospect, the company now being engaged in securing options on property along the road for use as rights of way for the additional trackage. According to general reports, the additional track would extend from Kenova to a point east of Williamson in the heart of the Kenova coal field. With an additional track, the company would be able to increase materially its facilities for moving coal originating in eastern Kentucky and in southern West Virginia and additional facilities would greatly stimulate the development of the territory along the main line of the road.

Freight traffic in July amounted to 38,513,263,000 net ton miles, according to tabulation of reports filed by the carriers with the Bureau of Railway Economics. Except in July, 1920, when this figure was exceeded by nearly 5 per cent, and July, 1918, when it was exceeded by about 2 per cent, this was the greatest freight traffic for any July in previous years. Compared with July last year, when freight traffic fell off somewhat due to the strikes of both miners and railway shopmen, freight traffic in July this year was an increase of 42 per cent. The average load per car in July was 28½ tons, an increase of three-tenths of a ton over the average for June this year and the highest average for any July since 1917, except in July,

1918, when the average was 30.1 tons, and in July, 1920, when it was 29.5 tons. The average movement per freight car during July was 27.8 miles, a decrease of ¾ mile compared with the average for June, but the highest average for any July in previous years except in 1917, when it was 28.3 miles.

The Interstate Commerce Commission will hold a hearing at Norfolk Oct. 22, under Examiner Disque, on **complaints against the Norfolk & Western, Virginian and Chesapeake & Ohio railways**, and several other subsidiary coal-handling concerns, by towing and barging concerns, charging that these coal handlers charge excessive rates on dumping and trimming coal at the piers. It is charged these rates are in violation of the Interstate Commerce Act.

Railroads of the United States during the month of August placed in service 19,167 new freight cars, as well as 362 new locomotives, according to the Car Service Division of the American Railway Association. They also had on order on Sept. 1, with deliveries being made daily, 72,906 new freight cars and 1,517 new locomotives. During the month of August the railroads placed in service 7,478 new coal cars, which brought the total number placed in service from January 1 this year to Sept. 1 to 46,659. Of the new freight cars on order on Sept. 1, box cars numbered 31,807; coal cars, 29,203; refrigerator cars, 6,989, and stock cars, 3,079.

Locomotives in need of heavy repair on Sept. 1 totaled 9,392, or 14.7 per cent, according to the Car Service Division of the American Railway Association. This was the smallest number in need of heavy repair at any time since Aug. 1, 1920, when the Car Service Division began the compilation of these reports. The number in need of heavy repair on Sept. 1 was a decrease of 1,095 compared with the number on Aug. 15. A new high record also was established from Aug. 15 to Sept. 1 in the number of locomotives repaired and turned out of the shops, the number for that period being 23,056. The railroads on Sept. 1 had 53,438 serviceable locomotives, an increase of 1,100 over the number on Aug. 15, while they also had 2,714 locomotives in good repair but stored for future use, which was an increase of 47 since the middle of August.

It required exactly a week, from Monday morning, Sept. 10, to Saturday night, Sept. 15, for Commissioner Henry C. Hall and Examiner W. J. Koebel for the I. C. C. to hear at Denver, Colo., all the testimony in the **complaint of the Colorado and New Mexico Operators Association charging rate discrimination by 41 railroads**. It was set up that rates on Colorado and northern New Mexican coal to South Dakota, Iowa, Nebraska, Missouri and Kansas are unduly prejudicial in favor of coal producers both in Illinois and in Wyoming. The complainants presented an array of statistics to prove it and railroad and Eastern coal traffic association men attempted to refute it with arguments based on comparative traffic densities on Western and Eastern lines, directness of haul and the like.

Hearings in coal traffic cases have been assigned as follows: United Collieries, Inc., vs. Southern Ry., Big Stone Gap, Va., Oct. 11, before Examiner McGrath; M. K. Piper Coal Co. vs. Blair R.R., Harrisburg, Pa., Oct. 12, before Examiner Witters; Pioneer Coal & Coke Co. vs. Pennsylvania R.R., St. Louis, Oct. 23, before Examiner Witters.

Coming Meetings

National Safety Council will hold its twelfth annual safety convention at the **Buffalo Statler Hotel, Buffalo, N. Y., Oct. 1-5**. Secretary, W. H. Cameron, 168 No. Michigan Ave., Chicago, Ill.

Fifth annual general Western meeting, Canadian Institute of Mining and Metallurgy, Oct. 3-5, at Estevan, Saskatchewan, Canada. Secretary, G. C. Mackenzie, Drummond Building, Montreal, Que., Canada.

American Gas Association, annual meeting Oct. 15-19, Atlantic City, N. J. Secretary-Manager, Oscar H. Fogg, 342 Madison Ave., New York City.

The West Virginia-Kentucky Association of Mine, Mechanical and Electrical Engineers will hold its annual meeting Oct. 19-20 at Huntington, W. Va. Secretary-treasurer, Herbert Smith, Robson-Pritchard Bldg., Huntington, W. Va.

Coal Mining Institute of America will hold its annual meeting Dec. 19, 20 and 21 at Pittsburgh, Pa. Secretary, H. D. Mason, Jr., Chamber of Commerce Building, Pittsburgh, Pa.

COAL AGE

The Only National Paper Devoted to Coal Mining and Coal Marketing

C. E. LESHER, *Editor*

Volume 24

NEW YORK, OCTOBER 4, 1923

Number 14

The Strike That Failed

HISTORY probably never recorded a bigger strike than that staged by Germany in the policy of passive resistance in the Ruhr. For eight months a whole industrial population has been on strike and has been receiving strike benefits from headquarters. The Ruhr is the densest, most active mining and manufacturing area in Europe, and when last January the French began to encircle it with troops and sought to turn its products to payments on reparations the world was circled with the phrase "You can't mine coal with bayonets."

The French did not mine coal with soldiers but they did wear out the resistance of their opponents. The Berlin government could not print paper marks fast enough or the trains run often enough to take them into the Ruhr to maintain the strike benefits. The passive resistance has been declared a failure. The greatest strike has been crushed, and with a minimum of bloodshed. Strikes, even large ones, can be won in opposition to determined, organized, well-financed forces, providing there is unity on the other side.

Premier Poincare united his side by assuming an aggressive policy and by controlling the policy of his nation. One may wonder how the coal strike in this country would have ended in 1922 had the operators all been following one leader and he been aggressive.

"Dear Governor Pinchot"

FIRST it was the Governor of Massachusetts, then the Governor of New Jersey and now it is the Governor of New York that is dictating this line, following it with his compliments on the anthracite settlement. If they don't stop plaguing him Pinchot will hate the sight of a crested letterhead.

On Sept. 10 the Governor of Pennsylvania wrote to the executive heads of all the anthracite-consuming states modestly calling attention to the fact that "by a slight wage increase the production of anthracite is now assured for two years," and suggesting that these several other governors look to it that the increase in wage cost was not passed on to the consumers in these other states. Pinchot admitted to "a special responsibility on himself in this matter" of seeing that consumers everywhere are not "gouged."

Governor Smith is meekness itself. He would not for a moment question the action of the Governor of Pennsylvania, where the coal is produced, of granting more wages to the miners "if in your opinion this was necessary." "But"—O! the suavity—"I do not believe that any public official should lead the people to believe, or attempt to lead the people to believe [*italics ours*], that the price of producing any commodity can be increased without increasing the cost to the ultimate consumer, unless profiteering can be proven." And then

the stinger—"Have you any evidence of profiteering so far as your state is concerned?"

Mr. Pinchot is reminded that if, as he wrote President Coolidge, some operators could absorb all the increase and yet make a profit, then "in the discharge of the special responsibility" which he acknowledges, he should make them do it. He is asked whether from his "intimate knowledge" of the coal business and the experience he "must have gained in the recent settlement" he has been able to gain any information from the report of the Hammond Coal Commission. Governor Smith seems to think that he has not.

Mr. Smith, like the other governors, recalls that the State of Pennsylvania has itself added to the cost of coal, as he puts it, "by the tax imposed at the mines and the addition of 50c. a ton imposed by the State of Pennsylvania upon production," and "now the settlement of the coal strike giving a further increase of 60c. a ton has made you assume the responsibility for these additions to the cost of coal to the consumer." Not just "Robbing Peter to pay Pinchot," as the *Wall Street Journal* aptly put it, but to pay Pennsylvania as well.

My Dear Governor Pinchot—"It seems clear to me that the duty and responsibility rests upon you and the State of Pennsylvania." And as an aside, not for publication of course, "As between aspirants for Presidential honors, now really don't you think it an awful blunder to raise the price of such a common necessity and then advertise it to the voters?"

The Mining Congress' Future

THE impression should not get abroad that the American Mining Congress is about to collapse for want of proper support. It is true that the convention of the Congress last week in Milwaukee drew a small attendance, that some of the scheduled meetings of minor divisions did not take place, and that part of the program lacked virility. But the Congress performs other services to the mining industry than merely to hold conventions and machinery exhibitions. As discreet and well-informed spokesmen for the mining industry in public places, the men representing the Congress are valuable. Their services should continue—and will—in spite of the fact that the organization has a hard time making ends meet, though the receipts for the past year totaled close to \$200,000.

The proposal to hold separate Congress conventions for coal- and metal-mining groups hereafter is a plan with obvious advantages and might prove successful even though a certain division of strength and lack of unity within the organization is almost sure to develop. It certainly is logical to assume that a convention held in some important coal center, with a program concentrating on coal and with an exhibition restricted to machinery used in coal mining and preparation, should

awaken more enthusiasm among coal men and exhibitors than one essaying to cover all mining. It is just as logical to assume the same thing for the metal-mining industry.

In recent years the Congress' meetings have held more of interest for coal men than any other class engaged in mining. The three most recent conventions have been close to the centers of coal mining. Yet coal men's interest has flagged. It needs stimulation. The Congress should be able to make itself a valuable clearing house for ideas about operation in coal. No other national organization is in a better position to do it. If the men at the helm within the Congress will devote themselves to developing a three-days' convention of discussion really vital to coal, and if the key men in coal will awake to the possibilities in such work for the improvement of the industry, then future conventions of the American Mining Congress will again become noteworthy.

What Do Miners Earn?

ON THIS question, around which such heated controversy raged in 1922, there is now a wealth of precise information. There is so much information, we fear, that the controversy is likely to break out afresh, unless the unfinished work of the Coal Commission is properly carried to a conclusion.

The report of the Coal Commission on Earnings of Mine Workers in the Bituminous-Coal Industry has just been published. It is a voluminous document, but not more so than the subject demanded. It represents the analysis of earnings of 332,668 mine workers in the soft-coal fields at 1,177 union and 751 non-union mines in 23 coal-producing states in 1921, with supplemental comparison of earnings of a smaller number in 1920. The report is a veritable mine of information, representing a more complete, comprehensive, scientific analysis of earnings of a larger number of employees than has ever been produced by any other investigation for any industry in this country.

Too much credit cannot be given the statistical experts who have given us this mine of information on earnings. There will be some, no doubt, who will assail the report as too scientific, too technical. In so far as this is true, it is the fault of the Commission, not those who prepared the report. The only credit that attaches to the Commission is for selecting highly competent people to do the work, a purely technical and very complicated job.

There seems to have been considerable misapprehension on the part of the Coal Commission as respects its duty and responsibility here. Appointed as a public body to report to the President and the Congress—that is, to the people; “in the public interest,” as it were—on the coal industry, this Commission assembles data on what the mine workers earn. The public is interested. It is curious to know what an impartial investigation of the miners' pay checks shows—how large they are, whether they are ample to give the worker and his family a decent living and how the earnings of these mine workers compare with earnings of workers in other industries. But the public is not told. The curtain is drawn over the results of this exhaustive study.

The Coal Commission takes the staff report, claps on a preface of three paragraphs, adds its signatures at the end and the incident is closed. It says that

in a study of earnings in so vast and so widely scattered an industry as bituminous-coal mining and one reflecting such a wide variety of both physical and social conditions, “it is not possible to give, in a few lines, figures or averages that are either typical or honestly representative.” Thus forewarned, who will dare generalize from this report! Continuing, “Nothing is to be gained in either accuracy or truthfulness of presentation by endeavoring to make appear simple that which is essentially complex. Such an effort merely blurs the picture and misleads the reader.”

The Commission goes on to say that the staff report here presented has not been “prepared for the casual or hurried reader, but for the serious student who desires to study all the elements in the industrial situation.” We concur. But what was the matter with these Commissioners—were they not the public's “serious students?” What was this Coal Commission for if not to “study all the elements in the industrial situation that characterizes the coal industry”? The Commission is convinced that the method of presentation here adopted is one that furnishes the basis for a series of enlightened studies that will go far “to stabilize and improve the labor conditions in this great basic industry” and to make it “a desirable social as well as industrial asset”—they might have had grace enough to say *more* desirable. This “rich mine” of statistics on earnings is bequeathed for exploitation by “competent students of our industrial and social problems.”

Dear Public, it is not for you to inquire what miners earn, whether they are well paid or poorly paid, whether their scale of wages and earnings thereunder is too high, and hence not in the public interest, or too low, also not in the public interest. Stand by and let competent students interpret this report on earnings for us!

To a subcommittee, Commissioners Neil and Devine, were assigned the studies of labor, including that on earnings. They are now confessing indifference or incompetence, or lack of desire to tell the American people in words of few syllables that the soft-coal mine worker makes higher daily wages by far than workers in other industries for the same degree of skill, training, and at comparable hazards. The Commission report does not show this or state it, but of almost simultaneous publication is the report of Illinois Miners' Earnings, 1918-1922, prepared and published by the operators of that state, which does show it. Also there is the report in *Monthly and Daily Earnings of Bituminous-Coal Miners*, published by the Brydon Committee. They are able to get some results that the layman can understand. The central Pennsylvania operators managed to come to some pertinent conclusions on the same subject, and from the same data that the Commission had.

It is the unfortunate truth, however, that the public always is likely to discount the operators' figures. The public wants its own Commission's word about whether the miner is simply well paid, overpaid or underpaid. The figures are in the report that Miss Anne Bezanson and her assistants prepared with infinite patience and labor, and the public's representatives warn us, unless we be competent students, to leave it alone, as they have.

And then turn to the recommendation in the “final” report, published last week, and find the place where the Commission says that the industry must be compelled by law to divulge information, through the Interstate Commerce Commission, on earnings of miners.

*Coal Commission Report
On Engineering and Management Shows*

Thickness of Coal, Size of Mine, and Use of Machinery The Three Factors in Efficient Production

Comprehensive Study of the Production Records for
Twenty Years of All Our Soft-Coal Mines Shows Gratifying
Progress in Better Methods and Efficiency of Operation

The thickness of your coal you cannot change; the size of your mine is fixed within certain limits; the other big factor in efficient operation, the use of machinery, is in your control. Here is a short, snappy Commission Report on Coal Engineering that is none the less interesting to coal men because written for the public.

Coal is produced the cheapest in those mines that are large, that have coal just a little thicker than the average man is high and that use the most machinery. This is the combined experience of all the soft-coal mines in this country, as brought out in the Engineering and Management Studies of the Coal Commission. The common measure applied to all was the efficiency in tons of coal produced per man per day. Taking into account all workers, the skilled and unskilled, the mine carpenter, electrician, blacksmith, the shoveler and miner, who work inside and outside at all the soft-coal mines, the average daily output per man was 4.19 tons in 1921. It had risen to this figure from 2.56 tons in 1890, steadily mounting to 2.98 tons in 1900 and to 3.46 tons in 1910.

This gain with time has followed the introduction of machinery and the better engineering practice that puts more machinery into industry. Throughout this period the other factors that influenced the efficiency of operation, the size of the mine and the natural conditions of which thickness of coal is the most important, have remained quite constant. In 1895, companies with outputs of 100,000 tons or more per year produced 71 per cent of the total soft coal; in 1905 the figure was 82 per cent; in 1920, 80 per cent. In 1895, 13 per cent of the total operating companies were in the group of those producing 100,000 tons or more; in 1905, 18 per cent; and in 1920, 17 per cent.

Mining Conditions.—The average thickness of coal mined has not changed materially as the thicker beds have been exhausted in the older fields, for thick beds have been opened in the newer fields. Thus the gains that have been made are the result of more efficient use of man power and the greater utilization of machinery. Some of this machinery is labor-saving, much of it is labor-eating. The use of machinery has brought with it new problems of safety; the electric cap lamp, for instance, gives the miner a better light than the safety lamp, but no warning against excessive gas. Electric motors have accelerated underground haulage but add to the accident hazard.

Coal is mined under an exceedingly wide range of natural conditions. Coal beds from less than 2 ft. to more than 50 ft. in thickness are worked in this country today, with the vast majority of the mines having coal between 4 and 10 ft. thick. Some mines are dry as the Sahara, others literally rain water in the work-

ings. Sometimes water must be pumped into the mines to wet the explosive, coal dust, but in most mines the water must be pumped or ditched out. To reach the coal beds some mines have shafts from a few hundred to a thousand feet or more deep, many enter the hillside on the natural outcrop of the coal. No coal bed is level, though many are approximately so. In the hard-coal region the majority now worked are steeply pitching.

The roof over some coal beds is hard and firm, over others it is friable and will not long stand without support. The floor is often clay that "heaves" and interferes with tracks and haulage. Some beds are clean coal from top to bottom, but the greater number contain layers of dirt or "bone" that must be removed, either by hand in the mine or by hand or machinery outside.

In many if not most mines the coal gives out gas, most often explosive, and immense quantities of air must be forced through the workings to dilute this dangerous gas to a harmless mixture.

Coal mining was a primitive form of endeavor. The coal bed was exposed in the hillside. Men dug into it, holding up the roof with props of wood. Fresh air was drawn in by creating a draft through a stove, wooden rails were laid on the floor, small wooden cars pushed by hand or drawn by mules or ponies brought the coal to the open air. The coal was picked down by hand. Mining in just such primitive ways is going on today. In contrast with these inefficient mines are those where advanced engineering, management and machinery are brought to grapple with the problems of gas, water, heaving floor and falling roof, the immense weight of rock overlying the coal bed, the long underground haul, and the cutting down and loading of the coal.

Management.—Man power is still and doubtless always will be the largest item of cost in producing coal. A mine with an output of 4,000 tons per day has nearly 1,000 mine workers. There are more than 600,000 mine workers in the soft-coal fields and 150,000 in the anthracite region. Labor, its management and efficient use is a major problem in coal mining. Labor cost represents nearly 70 per cent of the cost of production, supplies and general expense, including overhead, making up the remaining 30 per cent.

Thus the questions of engineering and management

How Productivity per Man per Day Varies with Size of Mine

Net Tons Produced per Man Employed per Day Worked, at All Commercial Bituminous Coal Mines. From Reports of Operators to U. S. Geological Survey.

Annual Tons per Mine	1905	1914	1920	1921
0—9,999	1.96	2.29	2.36	2.70
10,000—49,999	2.52	2.91	3.24	3.45
50,000—99,999	2.90	3.35	3.80	3.98
100,000—199,999	3.34	3.78	4.10	4.26
200,000 and over	3.80	4.18	4.50	4.73
Total, all mines	3.23	3.71	3.99	4.19

Read these columns from top down and from left across to right—without exception the larger the mine the more tons of coal per man, and each year better than the one before.

in coal mining have from the earliest time revolved around the two problems imposed by natural conditions and efficient use of labor. Coal mining is a huge engineering problem of material handling under adverse conditions. The material in any one mine must be collected from a large number of scattered working places, a few tons in a small pit car, brought by stages to a main haulageway and rushed out to be dumped through a tippie, cleaned, sized and put into waiting railroad cars. In this the engineering work has naturally divided two ways, into the purely mining engineering problems of laying out the underground haulage, the aircourses and the rooms in which the miners dig the coal, timbering, surveying and drainage, all with reference to the way the coal itself breaks down, its thickness, the nature of the roof, and the attitude of the beds. In all of these the first consideration must always be that of safety for the men and for the mine.

In the other direction are the engineering problems that involve largely the proper application of mechanical and electrical engineering to the work that is to be done—undercutting the coal, loading it into cars, motor haulage, types of cars and kind of track, hoisting, dumping and cleaning equipment. It is only by large-scale use of modern machinery that coal is and can be produced as cheaply as it is by the millions of tons each day in this country.

Handling Labor a Management Problem.—Management is not only complicated by the fact of large labor force but by the conditions under which that labor is employed. The coal miner who cuts down the coal, whether by hand or machine, and the loader who puts it into the pit cars is paid by the ton he gets out. In the soft-coal industry 60 per cent of the workers are thus contract workers, in the anthracite mines 40 per cent. These men are piece workers, laboring alone or in pairs in widely scattered rooms underground. As is shown in the separate studies of the Commission on the engineering aspects of underground management and on labor relations, the problem of supervision of such isolated workers is always of first importance.

Handling labor being the first and foremost everyday problem of coal-mine management, it is natural that the operating officials, the supervisory force, has been recruited from the ranks of the workers themselves. From miner to fireboss, up through assistant foreman to foreman, to mine manager or superintendent, has been the natural course for the abler men. Thus we find the intimate control of the mining operation in the hands of those whose chief qualifications is and has been ability to deal with the individual mine worker, and with the elemental forces of nature, the caving roof, the heaving floor, dangerous gas and wrecked mine cars.

In the better managed mines rule-of-thumb practices have been superseded by sound engineering. The larger companies have engineering departments as advanced in their methods as in any other industry, and often with many more problems to solve, but the average practice is far below the best. The anthracite industry because more uniformly profitable does not offer such a wide range between the best and worst; in the soft-coal field with its multitude of little operations it is a far cry from those holes in the ground at which the occasional visit of a surveyor is their nearest approach to an engineer to the modern plant with a corps of en-

Bituminous Coal Producers Classified by Size of Output in 1920

In making up this table each corporation, partnership or individual reporting production to the Geological Survey in 1920 has been classified by size of his total output. The classification is thus by size of company, not size of mine. Each corporation has been treated as a unit and no account has been taken of interlocking ownership or interest between companies. In the succeeding table, the data are expressed in percentage form.

Size Class	Number of Producers In Each Size Class	Number of Mines Operated By These Producers	Total Output Of These Producers
Country banks reporting	1,440	1,440	420,911
Wagon mines shipping by rail, other than local commercial mines	4,405	4,405	4,513,800
Commercial and local commercial mines producing as follows:			
Less than 2,000 tons	795	798	838,483
2,000 to 4,999 tons	806	814	2,604,260
5,000 to 9,999 tons	740	781	5,337,029
10,000 to 49,999 tons	2,121	2,381	53,348,269
50,000 to 99,999 tons	727	974	51,242,458
100,000 to 199,999 tons	543	988	75,508,562
200,000 to 299,999 tons	202	424	49,019,958
300,000 to 399,999 tons	94	215	32,965,932
400,000 to 499,999 tons	52	152	23,390,433
500,000 to 599,999 tons	33	98	17,914,499
600,000 to 699,999 tons	28	70	18,007,916
700,000 to 799,999 tons	20	122	14,969,468
800,000 to 899,999 tons	12	89	10,112,361
900,000 to 999,999 tons	16	140	14,149,119
1,000,000 to 1,249,999 tons	17	128	18,691,389
1,250,000 to 1,499,999 tons	9	119	12,471,314
1,500,000 to 1,749,999 tons	11	82	17,935,541
1,750,000 to 1,999,999 tons	10	97	18,747,933
2,000,000 to 2,499,999 tons	10	101	20,329,863
2,500,000 to 2,999,999 tons	7	110	21,697,649
3,000,000 to 4,999,999 tons	12	125	43,943,573
5,000,000 and over tons	4	213	40,505,963
Grand Total	12,124	14,766	568,666,683

The following table expresses the data in the preceding table in the form of percentages of the total both absolute and cumulative.

Size Class	Per Cent of Producers	Per Cent of Mines	Per Cent of Total Output	Cumulative Per Cent of Producers	Cumulative Per Cent of Mines	Cumulative Per Cent of Output
Country banks reporting	11.88	9.75	0.07	11.88	9.75	0.07
Wagon mines shipping by rail, other than local commercial mines	36.34	29.83	0.79	48.22	39.58	0.86
Commercial and local commercial mines producing as follows:						
Less than 2,000 tons	6.56	5.40	0.15	54.78	44.98	1.01
2,000 to 4,999 tons	6.65	5.51	0.46	61.43	50.49	1.47
5,000 to 9,999 tons	6.17	5.29	0.94	67.60	55.78	2.41
10,000 to 49,999 tons	17.50	16.12	9.38	85.10	71.90	11.79
50,000 to 99,999 tons	6.00	6.60	9.01	91.10	78.50	20.80
100,000 to 199,999 tons	4.48	6.01	13.28	95.58	84.51	34.08
200,000 to 299,999 tons	1.67	2.87	8.62	97.25	87.38	42.70
300,000 to 399,999 tons	0.78	1.46	5.80	98.03	88.84	48.50
400,000 to 499,999 tons	0.43	1.03	4.11	98.46	89.87	52.61
500,000 to 599,999 tons	0.27	0.66	3.15	98.73	90.53	55.76
600,000 to 699,999 tons	0.23	0.48	3.17	98.96	91.01	58.93
700,000 to 799,999 tons	0.16	0.83	2.63	99.12	91.84	61.56
800,000 to 899,999 tons	0.10	0.60	1.78	99.22	92.44	63.34
900,000 to 999,999 tons	0.13	0.95	2.49	99.35	93.39	65.83
1,000,000 to 1,249,999 tons	0.14	0.87	3.29	99.49	94.26	69.12
1,250,000 to 1,499,999 tons	0.07	0.81	2.19	99.56	95.07	71.31
1,500,000 to 1,749,999 tons	0.09	0.56	3.15	99.65	95.63	74.46
1,750,000 to 1,999,999 tons	0.08	0.66	3.30	99.73	96.29	77.76
2,000,000 to 2,499,999 tons	0.08	0.68	3.58	99.81	96.97	81.34
2,500,000 to 2,999,999 tons	0.06	0.74	3.82	99.87	97.71	85.16
3,000,000 to 4,999,999 tons	0.10	0.85	7.72	99.97	98.56	92.88
5,000,000 and over tons	0.03	1.44	7.12	100.00	100.00	100.00
Grand Total	100.00	100.00	100.00			

Everyone has a general idea about the number of small soft-coal mines in this country, but these tables tell the story in a simple effective way. That 85 per cent of the producers supply but 12 per cent of the output indicates the room for larger mines and for consolidations.

gineers developing and applying up-to-date methods and machinery.

The backwardness of the soft-coal industry in utilizing to a greater and more universal extent the best that modern management and engineering has to offer is plainly to be attributed to the speculative character of many of the mining enterprises. Those operators who have developed steady going businesses have no desire but to operate continuously; they are substantial going concerns. But a host of speculative operators come and go with the rise and fall of the spot price of coal. Since they operate only when a definite if not substantial profit is in sight, these operators give scant attention to good engineering and management practices. In times of high prices they can produce at a profit by slipshod methods, in poor times they shut down or at best are not financially able to invest in modern equipment. This explains why so much of the soft coal is produced inefficiently.

On the other hand the anthracite industry, which by comparison with the bituminous-coal business has been so uniformly profitable and which has had such a steady market for its product, has not had the economic incentive to reach out for always better and cheaper methods. Electrification of the anthracite industry, for instance, is backward compared with the most general advanced practice in soft-coal mining. The conservatism that pervades the anthracite industry has fastened on its engineering and management methods, as well.

Progress, Past and Future.—What better engineering and management mean to the coal industry and the coal consumer through lower cost may be illustrated by pointing out that if there had been no increase in efficiency since 1905 it would have taken the labor of 760,000 men working the average of 220 days to have produced the same tonnage of soft coal as was produced in 1920 with 630,000 men. In 1905 it took 0.31 man-day to produce a ton of coal, in 1921, but 0.24 man-day. Figured on the basis of the present basic day wage of \$7.50 per day this has meant a saving through better mining of 53c. per ton of bituminous coal, or about \$250,000,000 per year on normal soft-coal production. The further saving in housing by reason of the fewer men is an item of importance.

It is the conclusion of the engineering investigation conducted for the Commission under the direction of C. E. Leshner and R. A. Walter and summarized in this report that in the next decade there will be a reduction of 25 per cent in the man power required to produce a ton of bituminous coal through the continued development of better methods of mining, the more extended use of machinery, particularly for replacing hand load-

Trend of Size of Producing Corporation, 1905 and 1920

Data include commercial and local commercial producers only. Grouping is by size of company, not size of mine. Each operating corporation is treated as one producer, regardless of possible affiliations with other corporations.

Size Class	Per Cent of Total Operators		Per Cent of Total Mines Run By These Operators		Per Cent of Total Tons Produced By These Operators

ing, and by better management. The coal consumer, of course, will reap the larger share of any saving that is thus made, as it has that already accomplished.

The anthracite industry shows a different record. The working of thinner, deeper beds has been largely responsible for a reduction from 2.18 tons per man per day in 1905 to 2.09 tons in 1921. The gains from better engineering have been more than offset by the increasing handicap of natural conditions. The direction in which the anthracite industry can effect the largest economies lies in better utilization of the fine sizes; those below pea coal are marketed in competition with soft coal at prices below their actual cost of production. These economies will be attained by the use of the finest sizes as powdered fuel for steam raising and by some form of briquets or otherwise converting the fine coal to solid smokeless fuel of large size suitable for ordinary household use.

Improved methods of mining have conserved enormous tonnages of coal for future use by reducing waste in mining, and there is even yet opportunity for further saving.

From 25 per cent of the original anthracite in the ground recovered in the mining of 1850, the per cent of recovery has risen to more than 60 today and there is no reason why it should not attain 70 per cent. In the production of bituminous coal whereas 36 per cent of the original deposit was recovered by mining in 1850, 65 per cent is the average now produced, and bringing the poorest practice up to the average will bring the figure to 85 per cent.

The Mechanical Loader Coming Fast.—In management, the application of engineering to operation and handling men, the coal industry has not made the progress it has in the application of engineering to machinery and equipment. The day of the mechanical loader is just dawning. Nearly half the men in the coal mines are employed to shovel the coal by hand from the room floor to pit car. The use of the machine for this work will mean fewer men employed but it will mean higher wages and cheaper coal as well. The investment will add to the overhead cost in interest, depreciation and maintenance, but the increase will be offset many times over by reduction in total labor and other costs of production.

Studies by the industrial and mining engineers of the

Tons Produced by All Bituminous Operators, Including Country Banks and Wagon Mines, Classified by Size of Producer, 1905 and 1920

This table is not to be confused with others of this series, which include only coal from commercial (and local commercial) mines.

Size Class	Tons Produced By These Operators		Per Cent of Total Output	
	1905	1920	1905	1920
Operators producing annually				
Less than 10,000 tons.....	5,359,000	13,715,000	1.7	2.4

Commission, presented in detail in an appendix to this report show the possibilities of economies that can be, and are in some mines, realized by advanced management practice in the very important field of underground haulage. The standardization of equipment, of jobs and the better utilization of the time of the workers are fields of coal-mine management largely untouched as yet, largely because the supervisory force that operates the average coal mine today, is already overburdened with the work of handling the human element under the

adverse condition imposed by scattered working places.

The statement of these conditions carries its own obvious recommendations and suggestions to the coal industry. If anything further is required it is the suggestion that coal operators co-operate with the mining schools and colleges even further than they have in their efforts to train young men in the elements of coal-mine engineering and labor management and that these technically trained men be encouraged and given opportunity to learn the operating side of coal mining.

How Average Daily Output per Mine Worker Varies with Thickness of Coal, Size of Mine and Use of Undercutting Machines, 1921

Coal of Soochan and Its Importance in Pacific Trade

Output Rose with Russia's Progress and Fell with Its Decline—Six Coal Seams Three to Nine Feet Thick—Anthracite and High-Grade Bituminous Coal—Coke and Briquets Manufactured—Railroad Location Ill-Chosen

BY I. TOLMACHOFF*
Pittsburgh, Pa.

OF ONLY recent date is the development of the coal industry in Far East Russia. It found its first justification in the construction of the great Siberian R.R., which was and still is one of the most important consumers of coal, for the consumption of that fuel is still small in the Russian Far East. The industries which require so much coal in other countries thus far are lacking in these regions, and the domestic use of coal is spreading slowly. By and by, however, coal will drive out firewood, heretofore the traditional Russian fuel throughout the country.

It has been estimated that the possible annual demand for coal in the Russian Far East does not exceed 900,000 tons, but the local coal production has never reached so large a figure. Such an amount could well be produced from a single mine. It seems ill-fitting that it should be the output of a spacious country like the Russian Far East with its extensive and rich coal fields. The figures show that the consumption of coal and the development of the industry are only just starting in that region.

Soochan has a prominent position among the different localities in which coal is mined in the Russian Far East. The Soochan coal fields are situated in the Maritime Province of Eastern Siberia, 93 miles east of Vladivostok. The mineral was discovered in 1888 and successfully examined and prospected in the years

that followed. The good quality of the coal, as proved by laboratory tests and trials on steamers, and the possibility of its adoption for use by the Russian Navy decided the fate of the mines, and beginning 1900 they were operated by the government, the expenses being paid out of the state treasury. The government institutions—the Army and Navy departments, the railroads, etc.—acquired the greater part of the output of the mines. It is possible to say that for the greater part of the time the Soochan mines were working almost entirely for government supply. The importance of the government's orders for coal is shown distinctly

OFFICE BUILDING AT SOOCHAN MINES

The church can be faintly discerned on the left. A substantial building with the ground floor of stone. The upper story is of wood.

*Former managing director of Far Eastern Geological Committee and professor of geology in Polytechnic Institute, Vladivostok, Siberia; now curator of invertebrate paleontology, Carnegie Museum. The author desires to credit V. Paak, former manager and mining engineer, for information and illustrations furnished.

ROAD FROM MINES OVER SIKHOTA XALIN MOUNTAINS

These mountains separate the mines from the coastline. About 200 square miles are covered with forest which will supply the mines with timber for many years. Note the typical Russian conveyance. Though Soochan is a Chinese name the mines are on Russian territory.

in Table I, in which the quantity consumed is tabulated by kinds of consumers for the years between 1908 and 1919.

TABLE I—CONSUMPTION DISTRIBUTION BY USES, SOOCHAN MINES

Year	Government Consumption—			Total	Other Consumers	Percentage of Consumption	
	Navy	Army	Railroads			Government	Other
1908....	25,133	39,483	64,033	137,982	9,333	94	6
1909....	70,250	43,550	30,900	151,338	6,683	96	4
1910....	94,417	43,833	21,883	164,416	4,283	97	3
1911....	69,518	30,350	70,650	173,816	3,318	98	2
1912....	49,983	28,900	71,517	157,583	7,183	95	5
1913....	25,183	38,250	52,533	129,299	11,333	91	9
1914....	56,667	40,050	48,667	149,317	3,933	97	3
1915....	45,083	35,883	66,667	166,933	19,300	89	11
1916....	44,417	41,550	78,317	207,334	43,050	80	20
1917....	54,050	31,933	69,750	217,516	61,783	75	25
1918....	11,917	11,517	75,567	155,534	56,533	67	33
1919....	9,800	8,400	22,467	59,100	18,433	67	33

These conditions were very profitable for the enterprise, as the government alone could build a special railroad 73 miles long between the mines and the main road and install adequate mechanical equipment. For this reason the Soochan mines were the best mining operations in the Russian Far East, experienced workmen and employees being brought from the Donetsk coal fields of European Russia.

On the other hand, the government's enterprises in Russia were always defective from a commercial point of view, and the Soochan mines are no exception to that rule. It is possible now to say frankly that the mines could have been operated as they were only by the continued support of the government, which was given partly in an indirect way, namely by fixing a high price for the coal purchased.

In the last years of their operation, years when Russia was the victim of many political troubles, the

Soochan mines lost the support of the government. They delivered much less coal to government institutions and were forced to exist much as any other commercial enterprise; that is, they were compelled to pay all the expenses of operation out of their own income. The enterprise is in an extremely difficult position now and only with great difficulty can meet the unavoidable costs of everyday operation.

The Soochan coal fields extend over 850 square miles, ninety of which are more or less prospected and found coal-bearing; only 13 square miles, one-sixty-fifth of the whole region, forming the area of exploitation. This area has been examined in detail.

The coal-bearing measures occupy a strip of land one to two miles wide. They consist of Jurassic strata, severely folded in many places. Six coal seams are suited for operation. They have a steep dip which runs from 65 to 80 deg. and are of uneven thickness, varying between 3 and 9 ft.

According to recent geological investigations the whole coal reserve in the Soochan coal fields above a depth of 1,400 ft. can be estimated at about 40,000,000 tons, a quarter of which is in the well-prospected area of exploitation. However, there are good geological reasons to infer that coal-bearing strata exist outside of the prospected region, and the possibility of finding new coal bodies is promising.

Systematic mining started in 1903 with the completion of shaft sinking. The output increased gradually every year, reaching a maximum in 1917. From that year the output declined, the cause being political unrest in Russia and the decreased demand of the government institutions. The following table gives the production of the mines and the cost per ton loaded on railroad cars at the tippie:

TABLE II—OUTPUT OF SOOCHAN COLLIERIES BY YEARS AND COST PER TON

Year	Output Tons	Cost of Production—	
		Rubles	Dollars
1903.....	19,567		
1904.....	27,383		
1905.....	50,567		
1906.....	20,063		
1907.....	8,967		
1908.....	115,733	3.75	\$1.87
1909.....	177,917	3.94	1.97
1910.....	200,150	3.92	1.96
1911.....	218,900	4.06	2.03
1912.....	212,083	4.30	2.15
1913.....	166,733	4.64	2.32

per cent of volatile matter, 8 to 24 per cent of ash and not over 0.7 per cent of sulphur. The high percentage of ash forced the administration of the mines to erect picking tables and washeries.

From a marketing point of view Soochan coal can be divided into two classes: (1) Coking coal, containing 15 to 28 per cent of volatile matter and 8 to 12 per cent of ash. This coal compares well with the best coals used on the Pacific Ocean. It is well fitted for export. (2) Coal for which it is difficult to find consumers abroad but which can be used in the country domestically, for railroads and other purposes. This includes bituminous coal with 15 to 28 per cent of volatile matter but with more ash than coals of the first category, namely 15 to 24 per cent, and anthracite coals with 8 to 12 per cent of volatile matter and much ash.

In Table III two analyses of the better class of Soochan coal are given, which can be compared with coals Nos. 3, 4, 5 and 6, which are Japanese, and Australian coals used on the Pacific Ocean.

TABLE III—COMPARISON OF TWO SOOCHAN COALS WITH COMPETING FOREIGN FUELS						
	1	2	3	4	5	6
Moisture.....	0.83	1.12	2.28	2.57	2.36	2.00
Volatile matter.....	22.83	22.83	40.54	44.45	41.44	42.45
Fixed carbon.....	63.36	64.51	52.75	57.01	51.52	52.55
Ash.....	13.13	12.16	5.75	6.17	7.04	5.00

Equivalent.....	1.0	1.025	1.045	1.066		

1 and 2—Coking coal of Soochan coal fields. 3—Japanese coal of Ochy coal field. 4—Japanese coal of Beebay coal field. 5—Australian coal from Hebburn colliery delivered to Schonfield barracks, Hawaii. 6—Coal from same source delivered to Fort Ruger, Hawaii.

The calorific values of all three kinds of coal are somewhat similar. It will be noted that the lowest figure is 13,392 B.t.u. for a Japanese coal to 14,150 for one derived from Australia. The last two coals, which are quite similar to each other in their proximate analyses, differ greatly from the coal of the Soochan mines in the larger percentage of volatile matter and the smaller proportion of carbon and ash.

The only defect in the Soochan coal is the big percentage of ash, and this fault can be partly removed by washing. This is now being done. The other differences are in its favor as a steaming coal, which is demon-

strated in Table IV by comparing the quantities of Soochan coal and of other coals used on the Pacific Ocean that will produce a given result. The various coals are compared with the best Cardiff, its heating power being taken as unity.

Australian coal has a better reputation than that from Japan, but it is more expensive. In spite of this it is often preferred to the Japanese coal, if the consumer is looking for quality.

the total output not exceeding 500 tons a month, no byproducts being obtained or utilized.

Coke production started in the year 1908; it gradually increased in accordance with the demand of the market and reached its highest point in the year 1917, during the war, when Soochan coke was used largely in the military works and shops on the Siberian R.R. and was delivered as far as Omsk, over three thousand miles from the point of coking.

The output of coke is about 55 per cent of the weight of coal used. The average analysis of Soochan coke, prepared from washed coal, is: Fixed carbon, 82.49 per cent; volatile matter, 3; ash, 12.50; sulphur, 0.50; phosphorus, 0.01; moisture, 1.50; calories, 8,000; British thermal units, 14,400.

The data of the coke industry in tons and the costs of production in rubles and dollars are given in Table V.

The Soochan plants are well supplied with timber for mining and building purposes. About a quarter of the acreage—200 square miles—is covered with forest, thus making certain that there will be no lack of timber for the operation of the mines for many years.

Labor, strange to say, is not so scarce in Soochan as in the rest of Russia, though in a country having as scanty a population as the Russian Far East it well might be expected that labor would be more difficult to obtain than elsewhere. The Russian workmen who were brought to Soochan from European Russia at the commencement of mining, and their descendants are

HEADFRAME AND WASHERY AT NO. 2 MINE

The coal in the Soochan mining region contains from 8 to 24 per cent of ash. Consequently the need for a washery is evident. The washing is performed in the building on the right.

still living at the mines, being intimately connected with the enterprise. They undoubtedly were infected by the revolutionary propaganda of recent years and strikes were not infrequent, but after all there were good economic reasons for unrest and the troubles were not all due to political excitation.

The men were paid irregularly for their labor and not at the full rate; food and other necessities were of poor quality and in uncertain supply. In spite of these conditions—quite enough to cause laboring men to revolt in any country—it was the workmen's opposition which saved the mines, when their destruction was devised by Bolshevik agitators, who came to Soochan with their propaganda and urged the workmen to destroy there, as elsewhere, the instruments of capitalism. The Far East has, besides Russian workmen, a practically unlimited supply of yellow labor from

Mining Town, No. 1 Mine

The plant in the foreground readily will be recognized as the same as is shown in a previous illustration. Despite the large area of land available the village is placed close to the mine.

Bunkers of Aerial Tramroad

These are at No. 2 Mine. The tramroad brings coal from Mine No. 1. Observe the interesting bents to the right which economize space and timber. Probably there is little cause to be frugal in the use of the latter in Russia, but a saving of space everywhere has its advantages, especially around a yard. Rotary dumps can be seen above the loading pockets in the middle of the illustration.

China and Korea. Today 70 per cent of the workmen in the mines of Soochan are Russians and the other 30 per cent Chinese.

Though the production which the mines achieve is small, it is obtained only by the operation of several shafts and slopes, none of which, however, is more than 700 ft. deep. Every mine is supplied with its own boiler plant, its own power house and a separate staff of officials and workmen which are specially assigned to its service. Despite its low tonnage, each mine is practically a separate operation. Such extreme decentralization can be explained in part by the history of the development of the mines and in part by the defective industrial organization, but it readily can be seen

BRIQUET FACTORY AT VLADIVOSTOK

The coal yard of the Navy in Vladivostok contained large quantities of slack. In order to make of it a fuel better suited to the needs of the Navy a factory making prismatic briquets was erected. It has a capacity of 10 tons per hour.

to be a source of unjustifiable overhead expense. For example, owing to the many small plants it is necessary to operate twenty-five small boilers and these use 10 per cent of the coal mined.

But the way in which coal is delivered from the mines to the market is subject to even more serious criticism. Of the trackage of the Soochan R.R. 48 miles are of the usual Russian type with a wide gage, but 25 miles are of narrow gage (750 mm., or a little less than 30 in.). Where the narrow track crosses the crest of the Sikhoto-Alin Mountain a system of rope haulage with four hoists and three skid shoes is applied. The operation of this part of the road is complicated and expensive. There are ten stations and crossings in a distance of 18 miles and a large staff of

workmen has to be employed. The expense is increased by the frequency with which the machinery gets out of repair and by accidents along the road, especially that part of it which is served by rope haulage. The cost of transport on the wide-gage track, on account of some technical defects, is high also. These defects together make transportation on the Soochan R.R. so expensive that the price of coal is about doubled by the time it reaches the market.

Table VII gives the cost of transportation on the narrow track in recent years:

TABLE VII—COST OF TRANSPORTING COAL OVER NARROW TRACK										
Years.....	1912	1913	1914	1915	1916	1917	1918	1919	1920	
Cost of transport,										
per ton {	Rubles. 2.23	2.24	1.97	2.21	2.19	3.62	14.50	29.57	6.00	
	Dollars. 1.11	1.12	0.98	1.10	1.09				3.00	

The cost of transport on the wide-gage road before the war was 1.5 rubles, or 75c., per ton and at present time is 2.84 rubles, or \$1.42, which figured per mile is 0.03 ruble, or 1.5c., per ton and 0.06 ruble, or 3c., per ton, respectively. The cost of freight on the Oossoory (Ussuri) R.R., which is the part of the great Siberian R.R. between Vladivostok and the Soochan R.R. junction, a distance of 20 miles, was before the war 0.15 ruble, or 7.5c., and is now 0.25 ruble, or 12.5c., per ton, which figured per mile is 0.0075 ruble, or 0.37c., and 0.0123 ruble, or 0.6c., per ton respectively. This comparison shows that the cost of transportation on the Soochan wide-gage railroad was before the war four and is now five times more expensive than on the ordinary Russian railroad.

The total cost of coal transport between the mines and Vladivostok, before the war was therefore 3.88 rubles, or \$1.94, and is now 9.09 rubles, or \$4.54. With ordinary railroad connections these figures should be 0.70 ruble, or 35c., and 1.14 rubles, or 57c. The difference between the normal freight rate (the latter one) and that existing on the Soochan R.R. is due solely to the poor accommodations on the latter railroad. It has been estimated that during the existence of the Soochan enterprise the Russian government has paid for its delivered coal about 20,000,000 rubles, or \$10,000,000, more than would have been necessary had the track of the railroad been properly located. These figures are especially surprising when it is remembered that the total value of the entire coal field can be expressed at 12,000,000 rubles, or \$6,000,000.

The Soochan R.R. is not only expensive to operate

HOSPITAL BUILDING AT SOOCHAN MINES

A wood structure but quite extensive and set on an eminence.

in its present condition, but it is of small capacity as it cannot, even without any interruption of traffic, carry more than 300,000 tons yearly, but even that tonnage probably never will be reached. Increased development of the mines therefore would serve no useful purpose if the Sookhan R.R. is not so rebuilt as to be a continuous railroad having a gage equal to that commonly used in Russia. The technical possibility of this enterprise is proved by prospecting work performed in the years 1920-1921 by the Administration of Mines.

It may be of interest to mention that at the time when the Sookhan enterprise was being started, decision was made to construct a railroad about 27 miles long in a southerly direction to Nakhodka Bay. The cost of this short railroad, which would have had a capacity of 200,000 tons a year, would have been 3,000,000 rubles, or \$1,500,000. This estimate included the construction of a harbor with all equipment for coaling ships mechanically. The railroad thus projected was never constructed, for military reasons.

The lines at present are in bad condition. The political events of Russia were reflected in the Far East and at the Sookhan mines. All the equipment has worn out rapidly, not having been repaired promptly when repairs were needed. Much expenditure will be required to restore the capacity of the mines. It is estimated that the work started some years ago but not finished could be completed in two years at an expenditure of 1,800,000 rubles, or \$900,000. With it the output should rise to 400,000 tons annually, a part of which will be used in the running of the mines themselves and a part will have to be coked because the railroad can haul only 300,000 tons.

In spite of all difficulties, and they are many, Sookhan mines even now can deliver to the foreign markets a few thousand tons every month. It is regrettable that Sookhan coal is not known outside of Russia, as it is difficult for mines to look for the new consumers on the foreign market under present conditions and it is risky to send coal abroad without a definite order. However, once established in the market Sookhan coal will hold its own, for with an assured market will come improved methods of operation and a low production cost that will enable the management to lower the selling price. Labor is cheap in the Far East in comparison with what it is in America and Australia. The markets now receiving Australian coal are no further from Vladivostok than from Australia, and some, like Alaska, are actually nearer. Furthermore, with an improved railroad the figure for freight can be brought below the \$4.95 paid before the war. A railroad more judiciously constructed should haul a million tons annually, and the field could supply it for at least forty years out of the prospected area alone.

South Dakota Operates Its Own Coal Mine in North Dakota*

Finds Mine Prices of Private Concerns Reasonable but That Owing to Multiplicity of Retailers Delivered Prices Are Too High

GOVERNOR McMASTER of South Dakota having staged an attack on the distributors of gasoline, by offering the public state-owned fuel from its own warehouses at 16c. per gallon, or more than 10c. under the prevailing price for gasoline at filling stations, is now getting ready to show the mining world and writers on political economy in particular the part that a government can take in the production and sale of coal during emergency conditions, when capital, labor and dealers cease to function harmoniously and without proper consideration for the reduced purchasing power of the farmer's dollar. This state is actually one of the largest owners of coal lands, surveys indicating more than a billion tons of lignite in the two north-western counties.

Having left it to others to spend millions on experimental work trying to improve the quality and radically change the physical conditions of lignite coal, these hard-headed farmers decided in 1919 that an inferior quality of coal delivered at a low price to them was better than no coal at all. If public funds had to be spent, the most practical way would be to open a mine, operate it at the lowest possible cost and sell directly to the public. It seemed inconsistent that the very state institutions that were owners of these coal lands by direct grant from the federal government were paying excessive prices for Eastern coal hauled an average distance of 1,000 miles. The result was a state mine, located for convenient railway connections just outside the state at Haynes, Adams County, North Dakota, and today the largest producer of lignite in the Northwest. The theory then adopted was that if this grade of coal be delivered to the consumer he will find some way to burn it by appropriate changes in the type of stoves and grates or by improvements in the draft conditions.

VENTURE ON SOUND BUSINESS BASIS

Growth of the undertaking has been slow and hindered by setbacks that on several occasions brought operations to a standstill, but the scheme as a business venture was fundamentally sound and in the absence of political interference and with the energetic and efficient management of E. O. Roush the mine is today in a position where it can and will play an important part in the welfare of its owners, the citizens of South Dakota.

In spite of the immense area of the state and the long haul to the centers of population there are few points where the state mine cannot deliver fuel in car-load lots at a price beyond competition when figured on the basis of calorific value per dollar expended by the consumer.

Started primarily to supply only state institutions, the demand has grown to a point where orders from individuals, public-utility plants, municipal schools and public buildings, central heating stations and laundries exceeds the daily capacity of the mine equipment. The

*Article entitled "South Dakota Prepares for the Coal Shortage," received on the stationery of the South Dakota Coal Mining Commission, Pierre, S. D.

mine receives no public funds for improvements or extensions, these being met by surplus earnings, the original grant by the Legislature being amortized with interest by a charge of 15c. per ton of coal mined. Owing to its location outside the state of South Dakota it is duly and heavily assessed for local, county and state taxes. As a publicly operated enterprise it is therefore unique. Political opponents and misinformed taxpayers have motored up to see for themselves a waste of public funds and remained to place orders for their winter fuel.

Located on the Yellowstone Trail, which follows for a mile the southern boundary of the property, the mine has become one of the show places of the route for tourists coming and going.

The coal, as mined, is a firm black lignite with a brilliant luster and distinct cubical cleavage. Its moisture content is 32 per cent and its heat content 7,500 B.t.u. It holds together well during shipment and also in storage if not exposed in thin piles to sunlight or currents of warm air. Working conditions underground are excellent, the mine is dry, the ventilation good, the roof firm and the 16-ft. horizontal strata of coal free from layers of non-combustible matter. The seam is found 30 ft. from the surface.

A spur track $2\frac{1}{2}$ miles long operated by the mine con-

nects with the main line of the Chicago, Milwaukee & St. Paul Ry. Shipments are made to every county in South Dakota having railroad facilities and to adjacent points in North Dakota and as far east in Minnesota as Minneapolis.

The mine has a service department under the direction of Dr. Bancroft Gore, of the State School of Mines at Rapid City, where the utilization of lignite is studied intensively and the merits of base-burner heating stoves, magazine-type steam and hot-water heating furnaces are investigated and reported to the public, different types of automatic stokers and hand-operated grates for boiler operation also being tested. Dr. Gore has investigated the burning of state lignite in pulverized form without previous drying, results having been published in June of last year in the *Black Hills Engineer*.

One purpose of the state mine is to build up a steady demand for lignite by those heretofore accustomed to anthracite and in this way not only save residents large sums but stimulate the development of the lignite area by private capital. This mine can never fill all the requirements of the state but it is in a strategic economic position to prevent absolutely at any time unfair prices either by the mine owner or dealer by its advertised price schedule for run-of-mine, screened or slack coal delivered promptly at all points of the state.

In general it has been found that the wholesale prices of privately owned mines, after discounting the high freight rate from the long haul are reasonable, but the high cost and the excessive profits of local dealers have to be reckoned with, and the state mine with no initial intention of interfering in any way with the small dealer now advises the small consumer to form clubs of four or five members and buy directly in carload lots from the mine and have a local drayman weigh each truckload from the car, charging each subscriber his proportionate cost for coal at mine plus freight and truckage.

Again and again it was found that all advantages of low-cost fuel were discounted and entirely lost by the excessive cost of doing business by the small dealer. Usually there were too many of him in each community.

Big Three of the Cabinet

What Washington occasionally calls the important big three of the Cabinet are Hughes, Hoover and Mellon. Hughes and Mellon are in this group apart because of the importance of their particular offices, as well as because of their ability. Hoover is in it in spite of the relatively less importance of his Commerce Department, because of his extraordinary personal ability and because, as a matter of fact, he is so well grounded and so indispensable in many big matters that come up outside the limits of his particular official field.

As to Secretary Hoover, in addition to his own department, he is everything that is embraced in the dignity and efficiency of the phrase, "a competent workman." He contributes able and faithful trustworthiness for such frequently arising emergencies as coal strikes, unemployment, conservation and a dozen other matters calling for hard work, concentration of mind and immensely varied knowledge. It was one of the comparatively few easing comforts that Mr. Harding had in his difficult Presidency to know that at any hour, day or night, Mr. Hoover was at the end of the telephone wire, subject to call for any emergency. It was a reliance of which Mr. Harding made frequent use. Mark Sullivan, in *N. Y. Tribune*, Aug. 6, 1923.

SCENE IN THE LIGNITE MINES AT HAYNES, S. D.

Coal when mined is firm, black and cubical but it has 32 per cent of moisture and only half the heat of the best grades of coal. However, many believe that lignite found almost on the doorstep is preferable to coal hauled thousands of miles, even though it may contain only half the heating power of the more remote fuel.

New Equipment

Electric Hoist for Heavy Work

A NEW electric mine hoist development recently made by the Thomas Elevator Co., of Chicago, embodies oversize drums, low pedestals, semi-automatic control, through-bolt bearing construction, and extra large brakes. It is designed especially for pulling cars up inclines, sinking shafts, or any similar class of work which requires unusual strength and a large cable capacity. This particular hoist is similar in many respects to the standard Thomas single friction drum mine hoist but is designed for much heavier duty.

The new hoist is fitted with Thomas band frictions, which eliminate thrust bearings and their heating and welding tendencies. These band frictions are located in the opposite end of the drum from the brake. Both the friction and the brake are composition lined and of sufficient area for heavy service on long hauls. Machine cut gears are used exclusively throughout. Drum shafts are turned from forgings, pedestal bearings are of through-bolt design, and semi-automatic variable speed control is included as standard equipment.

NEW BAND FRICTION ELECTRIC MINE HOIST
A heavily constructed hoist for slope and shaft duty.

All motors are regularly furnished with a Thomas automatic irreversible safety brake. Control levers are banked in quadrant.

Steam-Jet Ash Conveyor

RECENT developments in the labor situation have brought home more forcefully the advantages of labor-saving equipment around the power house. Unskilled labor is becoming more pressing in its demands and more choice in the type of work it performs. Handling ashes is dirty, dusty, back-breaking work. Men stay at it only until they can get something less disagreeable. As a result the power plant crew is constantly shifting and changing.

The installation of labor-saving ash-handling equipment not only relieves the plant of the turmoil of changing labor but makes possible the transfer of men working in the boiler plant to other work.

In an effort to cut the power-plant payroll, the American Steam-Jet Ash Conveyor was manufactured by the Conveyors Corporation of America, 326 West Madison

USING ASH CONVEYOR

Here the fireman is shown feeding the ashes into the conveyor system as he cleans the fire.

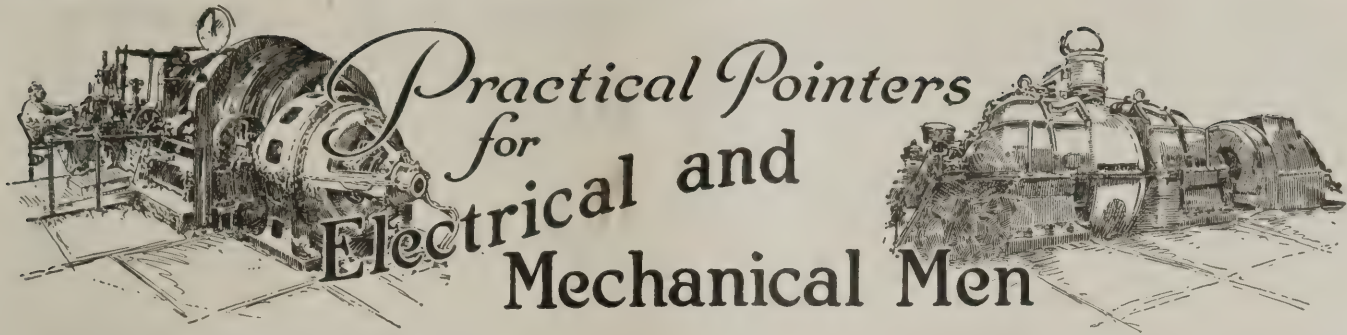

St., Chicago, for handling ash in power plants. At one mine this conveyor was installed several years ago with a saving of two men and a team. The daily savings amounted to \$12.38.

One of the advantages of the steam-jet conveyor is the effect on the morale of the other plant employees. The wheel-barrow gang no longer hampers the boiler-room workmen as they stoke their fires. The floors are kept clean; there is no dust-laden atmosphere.

STEAM UNIT OF ASH CONVEYOR

A jet of high pressure steam is introduced through this fitting into the conveyor line.

Reasons for Interchanging the Fields of Locomotive Motors While Braking

REFERRING to some interesting discussions which have recently appeared in *Coal Age* on the subject of electric braking for mine locomotives, I believe the following ideas will show some of the points brought out in investigations which have been made along this line.

The equalizer is the first thing which suggests itself to anyone studying electric braking for locomotives, because of its simplicity. However, there are several serious objections to its use. The series direct-current motor has inherent characteristics which tend toward keeping the load on two or more motors running in parallel and driving the same load balanced, even though the speed of the two motors is not exactly the same. This is particularly essential in the case of locomotives and street cars as the diameters of the driving wheels change due to wear and one wheel may be considerably greater in diameter than another on the same locomotive or car.

A locomotive could very readily be selected and the fields of the two motors connected by means of an equalizer and a small amount of resistance so that the current in their armatures balance. If conditions on the locomotive remain exactly the same it might run indefinitely without any serious unbalancing, but the wheels of the locomotive wear and in a short time one set of wheels might easily become greater in diameter than the other, with the result that the motor connected to the wheels with the greater diameter would run a little slower than the other set of wheels, and since the fields of the two motors are balanced by the equalizers between them, the motor running slower would generate a lower counter electro-motive force and take more current than the faster motor, the amount of unbalancing depending upon the difference between the diameters of the two pairs of wheels. This unbalancing will occur whether the machines are running as motors or generators.

One of the reasons for selecting a series motor for traction work is its ability to take its share of the load when two or more motors are operated in parallel and connected mechanically to the same load. Shunt motors, which maintain a practically constant speed over a wide range of load, will not divide their loads equally when operated under these conditions and a very slight change in the speed of one motor will change to a large extent the amount of current it draws from the line. Using an equalizer between the fields of series motors gives them characteristics similar to the shunt motor.

Reference has been made to the use of equalizers to maintain a balance between generators in power plants. Generators operating under these conditions are pro-

vided with strong shunt fields. The series fields are only a small proportion of the total field. The balance between the machines is first obtained by adjusting the shunt-field rheostats. The function of the equalizer between the series fields is to keep the current equalized between the generators under varying loads after they have been balanced by adjusting the shunt fields.

Numerous tests have been made of electric braking using several different connections. Interchanging of the fields has been found to be the most reliable connection for insuring an equal division of the load.

General Electric Co.

Paralleling a New Transformer

A NEW transformer often has to run in parallel with existing units, and in order to make the right connections considerable care is necessary. A short-circuit may accidentally result from getting some of the windings of the transformers to be paralleled on the line in series instead of in opposition.

There are two simple methods by which the connections can be checked, always assuming, of course, that the transformers to be paralleled are similarly connected internally. The first is to note the direction of rotation of an induction motor fed from the low-pressure bus bars of one transformer; then substitute the new transformer for the first one, and the motor should run in the same direction, the transformers may then be connected together.

The second method and the one which is perhaps preferable is to connect up the high-tension side of the new transformer ready for running from the high-tension bus bars. On the secondary side one line wire should be permanently connected to the low-tension circuit breaker which will be employed for

PARALLELING A TRANSFORMER WITH ANOTHER

The test lamps give an indication which tells when the secondary terminals are properly connected to the lines.

controlling the low-tension side of the new transformer. This switch should be in the "off" position until everything is in readiness. Having connected, say, line *A* to one terminal of the low-tension switch as shown in the figure, the two remaining line wires should be connected temporarily to the other two transformer terminals through a number of 200- or 220-volt lamps in series. On a 500-volt circuit two 250-volt lamps in series would be suitable, as indicated on the illustration. Any number of lamps will suffice so long as the full-line voltage of the transformers is high enough to make them glow. It is unnecessary that the lamps fully light, as a decided glow will be sufficient for conducting the test.

When everything is in readiness, as indicated in the figure, the high-tension line and oil switches of the new transformer are closed; these are not shown in the figure. Then the low-tension line switch is closed and afterward the circuit breaker, which should be set to open on a very low current. This connects the secondary of the new transformer through the lamps to the busbars which are assumed to be fed from an existing transformer with which it is desired to parallel the new transformer. If the lamps light up, the lines *B* and *C* are crossed and should be interchanged. If the transformers are of normal design the lamps will then be dark, in which case the new transformer may be isolated and the connections between the lines and transformer made in the usual method direct from the circuit breaker to the transformer. In the event of the connection appearing to be right the first time, it is advisable to change the leads temporarily in order to get the lamps to light as a check on the condition of the test lamps and lamp-holders. A possible broken connection in each series of lamps—an unlikely but possible coincidence—might lead to a serious result if not checked in this manner.

Making Signaling Bells Safe Against Ignition of Gas

IT IS a well-known fact that when the circuit of an ordinary electric bell is interrupted the self-induction of the magnet coils gives rise at the contacts to a spark which is sufficiently hot to ignite a gaseous mixture, and from time to time this source of ignition has been suspected of being the cause of mine explosions.

In the case of trembler bells the ignition of gas is more likely to take place at the make-and-break contact of the bell itself than on the signal wires or at the switch. With single-stroke bells, however, the break flash may occur on the signal wires or at the switch only. A single-stroke bell usually needs a larger current, and of the two it is less safe in its operation from the viewpoint of gas ignition.

There are two methods available for overcoming the undesirable effects of self-induction in the bell coils. One employs a copper sleeve which surrounds each of the coils but to obtain most efficient results the sleeves must be properly proportioned, and this involves the use of certain mathematic calculations. The other method of attaining the same end, but with more certainty, is by employing what is known as a short-circuited winding.

The object of these notes is to indicate briefly how the break-flash of existing electric bells may be rendered harmless by rewinding and at the same time

FIGS. 1 AND 2—SINGLE-STROKE AND TREMBLER BELLS WITH SECONDARY AUXILIARY WINDING

Both types of bells may be wound with auxiliary windings, which have a dampening effect upon the arc, occurring wherever the circuit is broken during operation.

applying a short-circuited winding, which needs no calculations and therefore requires little or no technical skill in its application. To rewind an electric bell to apply this secondary winding requires more space on the magnets themselves. Many bells have magnets which are not fully wound and the additional space can be utilized without increasing the diameter of the bobbin ends in order to take the extra amount of wire.

In many instances old bells will be found to have windings of comparatively low resistance. In winding such bells a wire of smaller section may often be employed. This provides the necessary space for the additional winding, and by filling the bobbins entirely the resistance of the working winding can be made higher than the original one. If the bobbins on a bell to be converted are already full of wire and the construction does not lend itself to increasing the depth of winding by enlarging the diameter of the bobbin ends, then new bobbins must be made. These can easily be cast or they may be turned from the solid.

The wires for winding should be double-silk covered, so that the insulation between the operating and the short-circuited winding will be reliable. In winding, reels of wire are employed. These should be suitably mounted so as to turn freely as the winding proceeds. The bobbin to be wound also should be mounted free to turn and provided with a temporary handle. Winding proceeds in the usual way, except that the wire is fed double, so that for every turn of working winding there is one short-circuited turn.

When the bobbins are filled an insulation test should be made on each coil between the two windings. If the test is satisfactory, one winding on each bobbin—it does not matter which—will be short-circuited—that is, its two ends joined together and soldered, afterward being joined to one terminal of the working winding. This prevents any strain being placed inadvertently on the insulation between the windings and in no way affects the functioning of the short-circuited element. The illustration shows how the windings are arranged and connected on a single-stroke and a trembler bell. The advantages of this method of neutralizing the break-flash of signal bells are:

(1) The short-circuited winding always bears a fixed relation to the working winding and is independent of the number of turns, seeing that a short-circuited turn is introduced with every working turn of wire.

(2) The application is simple and can be carried out by an unskilled person, no calculations being required.

(3) Bells with these short-circuited windings can be worked with almost absolute safety.

Normal vs. Reverse Faults in the Mining of Coal

Illustrating Two Types of Faults—Conditions Affecting Their Formation—Simple Rules for Finding the Coal Beyond a Fault

IF NOT too late, kindly allow me to refer to a matter that was discussed some time ago, in *Coal Age*, in reference to finding the coal beyond a fault. Following that discussion, I remember that an inquiry appeared, in these columns, where a correspondent presented a faulted proposition, encountered in the working of a coal seam, and stated that he was puzzled to locate the continuation of the seam.

A little later (*Coal Age*, July 5, p. 18) a correspondent drew attention to the fact that the fault plane may have any direction with relation to the plane of the seam, the strike lines of the two planes not necessarily being parallel, as has generally been assumed in treating the subject.

To my mind, this last contribution has not simplified the matter for the practical miner who suddenly runs up against a fault that has cut out the coal. The solving of the problem, as it occurs in coal measures, does not require a technical education. As far as the practical miner is concerned, it is simply a matter of observation and the following of a simple rule.

Referring to the accompanying figure, there are two general types of faults of dislocation. The two faults

Normal faults
Reverse faults
CHARACTERISTIC FAULTING OF COAL SEAMS

shown on the left of the figure are those commonly met and known as normal faults. On the right of the figure, are shown two reverse faults, one in which the seam is continuous having been doubled on itself, while in the other the continuity of the seam has been broken by the slip in the strata.

In the case of a normal fault, the slip has taken place in such a way that the two portions of the seam have been pulled apart horizontally and there is no overlapping as in the case of a reverse fault, where the

pressure has been exerted in a manner to produce buckling in the strata.

In the latter case, the strata, including the seam of coal, may simply be folded on itself, in the form of a letter S. At other times, the action is so sharp as to rupture the strata and destroy the continuity of the seam. In any case where rupture has occurred and the seam is not continuous, there is always left, however, a telltale drag or bending of the strata in the line of fracture, which shows the direction in which the movement has taken place.

While there is no way of telling how great the displacement has been, without drilling through the strata or prospecting the place, there are two simple rules that if followed will always lead to the continuation of the seam. A study of the figure will show that when the fault is normal one must follow the wide angle; but, in the case of a reverse fault, the rule is to follow the smaller angle that the seam makes with the plane of the fault.

Entering Abandoned Mines

Fatal explosion of gas when men entered an abandoned shaft—Need of law forbidding persons entering such places without the written consent of the mine inspector.

WHEN reading the account in *Coal Age*, Aug. 23, p. 285, where six men entered a 200-ft. shaft known as the Marcoll mine, near Clarington, Ohio, Aug. 2, 1923, I was deeply impressed with what seemed to be the careless statement reported as having been made by an engineer who visited the mine two days later.

In the last paragraph of the article, it is stated that the engineer regarded the explosion as a "deplorably unfortunate occurrence, with no blame to be attached to any one." It quoted the engineer as saying further, "It is easy now to say that the shaft should have been ventilated and safety lamps used; but who would ever have perceived that necessity before the explosion happened?" I want to ask: "Why Not? Are not mining men supposed to be on the alert when undertaking to enter abandoned places where dangers lurk?"

DISREGARD OF KNOWN DANGERS

In this instance the party that entered the fatal shaft consisted of the general manager of the mine, his brother who had charge of the Rosemary mine nearby, an engineer of the Allen & Garcia Co., of Chicago, Ill., and three other men of Wheeling, W. Va. All of these men were intelligent men who might be supposed to understand the dangers they were about to face.

From the meager report given in the article to which I have referred, nothing is said in regard to whether the mine had generated gas previous to its

abandonment or whether the airshaft nearby was generating gas. Prior to connection being made between the two shafts, the mine was being developed and coal hoisted at the airshaft.

It was with the intention of making the abandoned shaft the main hoistway that the party entered that shaft to investigate its condition. The result was that the general manager and a salesman for the Gee Electric Co., Wheeling, W. Va., have since died from their burns and two others of the party are in a serious condition.

The flame of the explosion is said to have shot to a height of ten or fifteen feet above the top of the shaft. One can only conjecture as to where the gas came from. The shaft had only just been drained of the water that had accumulated and risen to a considerable height during the two years since work was abandoned therein.

WHAT HAPPENED WHEN THE MEN DESCENDED

The day of the explosion, the water had been lowered to within 2 ft. of the bottom, and it is probable that the entrance of the six men who descended the shaft started a circulation that brought the gas from its lodgment to where it was ignited on their open lights.

Aside from the danger of meeting explosive gas, there was the possibility of encountering blackdamp. To climb down the stairs of this 200-ft. shaft, with open lights and without having previously made any attempt to ventilate the shaft and its 60 ft. of entry which had been driven, was an exceedingly reckless act on the part of mining men.

What little natural ventilation was produced by the movement of the men and the heat of their lamps and bodies, in descending the shaft, could not have supplied fresh air sufficient to dilute even a few cubic feet of the gas accumulated below, and it is possible that the mixture reached a highly explosive point.

Does not this incident, however, teach the lesson of the need of a law forbidding any one to enter an abandoned mine or shaft without notifying the district mine inspector and obtaining his written consent, which would involve the inspector's making an examination of the place before giving such permission.

Detroit, Mich.

GASTON F. LIBIEZ.

[This correspondent has drawn attention to an important consideration that should be incorporated in the mining laws of every coal-producing state. The law should make it a crime for any one to enter an abandoned mine or shaft, until the mine inspector of the district has been notified and has examined the place and given his written consent for those in charge to enter. Too often it has happened that lives have been lost through a reckless disregard of well known principles and regulations regarding safety.

In this connection, it may be stated that the Mining Laws of Ohio (Sec. 939) require that "the owner, lessee or agent of a mine shall give notice to the chief inspector of mines . . . when the working of a mine is commenced after an abandonment or discontinuance thereof for a period of more than three months."

If this was not done in the present instance it was a violation of the law. On the other hand, if notice had been given to the chief inspector of mines, advising him of the dewatering of this abandoned shaft with a view to its development, it would seem that the responsibility rested with the inspector. In any case, however, the shaft should not have been entered without first being ventilated and examined with safety lamps to ascertain if gas was present.—EDITOR.]

Careless Act of Fireboss Causes Disaster

Fatal explosion the result of one careless act—Responsibility does not rest on fireboss alone—Mine officials blamed for lack of supervision.

IT IS with deepest regret that we read, in *Coal Age*, Aug. 23, p. 296, of the terrible disaster which, judging from the evidence given before the coroner's jury at the inquest held a few days after the explosion, resulted from the seeming attempt of a fireboss to relight his safety lamp.

The sad occurrence happened at 8 o'clock, Tuesday morning, Aug. 14, in No. 1 mine of the Kemmerer Coal Co., Kemmerer, Wyo. At the time of the explosion there appears to have been 134 men in the mine, only 35 of whom escaped; and 99 lives were sacrificed to the heedless act of one whose duty it was to safeguard both the mine and the workers therein.

FIXING RESPONSIBILITY FOR THE ACCIDENT

Without more definite information than we have at present, it is impossible to pass accurate judgment on the unfortunate fireboss, who forfeited his life, and the higher mine officials, charged with the responsibilities of operating the mine in the safest manner possible.

On the fireboss rested the duty of performing his work intelligently and conscientiously, while on the shoulders of the management rested the responsibility of providing proper equipment and carefully supervising every operation.

The last report of the state mine inspector, made three months prior to the explosion, described the mine as being in good condition and the ventilation adequate. It was testified at the inquest that the lamp the fireboss had carried was found 12 ft. from the face of No. 7 room, on the thirtieth entry, and close to the body of the man himself. It is stated that the top and bottom of the lamp were found 2 ft. apart, while a match with the head burned off was lying but a few inches away from the bottom of the lamp.

The natural conclusion of these evidences is that the fireboss had taken his lamp apart, struck a match to relight the wick, and the flickering blaze had set off the gas, filling the place with flame from which there was no escape. There was no opportunity to warn the workers in other portions of the mine who, with few exceptions, were either killed by the force of the blast or suffocated by the deadly afterdamp.

WHERE THE FIREBOSS FAILED

We never read of an accident without, in our own minds, fixing the blame on some one who it appears was in fault. In this case, it would seem that the unfortunate fireboss should have known better than to attempt to light his lamp within 12 ft. from the face of the room where he was found, assuming that to be the case from the evidence produced. Such an attempt can only be characterized as heedless and reckless in the extreme.

On the other hand, we are left to wonder if the lamp of the fireboss was equipped with an igniter. The fact that the lamp had been taken apart would indicate that it was not; or that the igniter had failed to work. Again, it would appear that this fireboss was in the habit of carrying matches with him to relight his lamp when extinguished.

These conditions, at the best, reflect on the management in charge of the mine, for their failure to properly

supervise the work in every detail. The question arises, in this connection: Was the fireboss a competent and conscientious person, one worthy to be trusted with the important work of safeguarding the mine and its workers?

Here is food for thought that impresses us with a realization of the grave responsibility that rests heavily on the management of a mine when we think of a hundred lives being suddenly snuffed out by a seemingly unwarranted act of a responsible mine official.

Inquiries Of General Interest

Practical Limitations in the Action of Siphons

Two Cases to Be Considered—Effective Head
Less than Atmospheric Head — Effective
Head Greater Than Atmospheric Head

More than once the question has been put to me, by coal operators and mine officials, asking, "Can a siphon have too much fall?" I have always argued that, the greater the fall in the discharge pipe, the greater would be the flow. In other words, my thought was that for the same size of pipe, the capacity of a siphon for handling the water increased with the depth of its fall. Some recent experiences, however, have shown me that this is a mistaken idea and there are limits beyond which the siphon will not do its most effective work. I shall very much appreciate seeing the matter explained in *Coal Age* and the conditions set forth that are needful to the successful operation of siphons under varying conditions.

MINE ENGINEER.

Lexington, Ky.

In the operation of every siphon there are two chief factors: 1. The lift or suction head, which is the vertical height of the summit or crown of the pipe line above the level of the water in the supply basin. 2. The fall of the discharge pipe measured vertically, which is the discharge head and is always the greater. The difference between the discharge head and the suction head is the effective head, which produces the flow of water from the upper, or supply basin, to the lower basin where it is discharged from the pipe.

In practice, there are two cases to be considered; but, first, it is necessary to remember that the atmospheric pressure, acting equally on the surface of the water in each basin is balanced; and the effective head, or the excess of the fall over the rise in the pipe line, is the force producing the flow when the two branches of the siphon are acting as one.

As previously stated, there are two cases to consider. In the first case, the fall of the discharge pipe or the discharge head, minus the friction head in that branch of the pipe, is less than the water column supported by the pressure of the atmosphere. When that is the case both the suction and the discharge pipes are kept full of water by the atmospheric pressure, and there is no

In my own experience of firebossing for a period of ten years, I cannot recall a single instance when the mine foreman or the superintendent ever examined my lamp to satisfy himself that it was safe and properly used. I have known of firebosses who would clean the gauzes of their lamps with a corncob and do other things equally bad and dangerous. Let our mine officials give closer supervision to every detail of the work and know that their firebosses are competent and men to be trusted.

Ashland, Ky.

MINE OFFICIAL.

tendency of the siphon to empty itself or run dry, as it would if the discharge head less the friction head exceeded the atmospheric pressure. Therefore, in this first case, the pipe will always run full.

In the second case, the fall of the pipe line is so great that the discharge head, less the friction head in that branch of the pipe, exceeds the atmospheric head expressed in water column. At sea level under normal conditions, the atmospheric pressure being 14.7 lb. per sq. in. will support a water column of $14.7 \div 0.434 =$ say 34 ft. In order that the siphon shall run full in this case, the flow from the supply basin to the summit, under atmospheric pressure, must be equal to the flow from the summit to the discharge basin, under the gravity head or fall in that branch of the pipe.

Now, indicating the flow of water in the pipe by G (gal. per min.), the diameter and length of the short

ELEVATION SHOWING PROFILE OF SIPHON LINE

arm of the siphon by d and l , respectively, and the diameter and length of the long arm by d_1 and l_1 ; the effective head in the short arm is the atmospheric head (34 ft., water column, sea level), resisted by the gravity head or rise (h) and the friction head ($l G^2/800 d^5$). In the long arm, the effective head is the gravity head or fall (h_1), resisted by the atmospheric head (34 ft.) and the friction head ($l_1 G^2/800 d$), assuming a uniform diameter in both branches of the siphon.

But the velocity and quantity of flow (G), in each branch of the pipe (uniform diameter), is proportional to the head and inversely proportional to the mass moved or length of the respective pipe. Therefore, for an equal flow in each branch of the siphon, each effective head must be divided by the corresponding length of pipe l, l_1 ; which gives

$$\frac{34 - h}{l} = \frac{h_1 - 34}{l_1}$$

From this equation we have for the limit of fall of the siphon when the diameter of the pipe is the same throughout,

$$h_1 = \frac{l_1 (34 - h)}{l} - 34$$

In this last equation, it appears that the lift or suction head (h) of a siphon cannot exceed the theoretical water column supported by the atmosphere and the fall in the discharge pipe is dependent on the relative length of the two branches of the siphon.

To illustrate, assume a siphon pipe line at sea level, having a rise of 24 ft. in 100 ft. measured on the pitch, and the point of discharge, say 500 ft. beyond the summit. In this case, if the diameter of the pipe is uniform throughout, the fall from the summit to the discharge basin should not exceed $500/100 (34 - 24) = 34 = 16$ ft. If the fall is greater than this, the pipe will have a tendency to empty itself, the flow in the discharge end, under gravity, being greater than that in the suction end, under the pressure of the atmosphere.

In all siphon work, it is of the greatest importance to make all joints airtight and submerge both ends of the pipe, in order to prevent the entrance of air, which would find its way to the crown or summit and obstruct the flow. A good siphon line should always have means for tapping the air that escapes from the water and collects at the summit. This air is more troublesome as the limits of siphoning are approached.

Examination Questions Answered

Miscellaneous Questions

(Answered by Request)

QUESTION—An airway is 5×10 ft., in section, and 2,000 ft. long; the velocity is 400 ft. per min. Find the pressure in two ways.

ANSWER—The rubbing surface in this airway is $2(5 + 10)2,000 = 60,000$ sq.ft.; and the sectional area $5 \times 10 = 50$ sq.ft. Then, assuming a coefficient of friction, $k = 0.00000002$, we have

$$p = \frac{k s v^2}{a} = \frac{0.00000002 \times 60,000 \times 400^2}{50} = 3.84 \text{ lb. per sq.ft.}$$

The pressure can also be calculated from the quantity of air in circulation, which is $5 \times 10 \times 400 = 20,000$ cu.ft. per min. This gives for the pressure producing the circulation,

$$p = \frac{k s q^2}{a^3} = \frac{0.00000002 \times 60,000 \times 20,000^2}{50^3} = 3.84 \text{ lb. per sq.ft.}$$

QUESTION—Name the supplies required by law to be kept at all mines for the care of injured persons.

ANSWER—Besides the ambulance and stretchers required in Art. 7 of the anthracite law, there must be kept at every mine both woolen and waterproof blankets, oil for the treatment of burns, bandages, splints and linens.

QUESTION—Name and define the four electrical units that are in common use.

ANSWER—The four most common electrical units are: The ampere, expressing the strength of the current or the volume of the flow of electricity; the volt, expressing the pressure or difference in potential of the current; the ohm expressing the resistance offered by the conductor, as measured in terms of the ampere and the volt. A current of one ampere flowing under a pressure of one volt represents a resistance of one ohm. The watt is the unit of electrical power, or the power consumed in transmitting a given current against a given resistance, or under a given pressure or voltage.

QUESTION—A fan driven by a steam engine supplies air in a mine through several miles of air-course. A door is suddenly opened allowing the air to go directly from the air shaft to the return. Will the opening of this door cause any change in the operation of the fan? Give the reason for your answer.

ANSWER—The opening of the door at the shaft bottom short-circuits the air current and cuts out the mine resistance against which the fan was previously operating. This decrease of resistance is followed at once by a fall of pressure and a large increase in the quantity of air flowing through the fan, increasing the resistance to its passage between the blades, which means an increase in the power absorbed within the fan itself. As a consequence, there is a less power available for starting the fan which will run slower under these conditions. In other words, when the air is short-circuited, by opening the door at the shaft bottom, and the mine resistance cut out the speed of the fan will be reduced, for the same power applied to the fan shaft.

QUESTION—(a) Give a full description of a safety lamp. (b) What are its essential characteristics? (c) In what condition and under what circumstances may a safety lamp be unsafe?

ANSWER—(a) The safety lamp, as used in coal mining, consists of a brass or steel oil vessel surmounted by a chimney, which may be composed of a glass cylinder surrounding the flame and carefully fitted to its seat on top of the oil vessel. Above the glass cylinder and resting on it are one or more gauzes having more or less a conical shape. Asbestos washers are placed above and below the glass cylinder to form an airtight joint and exclude the outside air at those points. The chimney is held in place by means of upright standards firmly attached to the oil vessel and surmounted by a metal disk or plate to which the handle of the lamp is attached. This in brief is the description of a common safety lamp for general use.

(b) The essential characteristics of a safety lamp are the isolation of the flame of the lamp from the outside atmosphere. The gauze-protected openings below the flame, in most lamps, and the wire-gauze chimney above the glass cylinder provide for the necessary ascensional circulation within the lamp, which is important in order to prevent the smoking of the flame and essential to a maximum illumination. In practice the gas-charged air enters the lamp and the gas burns within the combustion chamber while the flame is prevented from passing out through the chimney by reason of the cooling effect of the wire gauze. The flame of the burning gas is extinguished in proximity to the gauze as long as the latter remains cool. The cooling effect is assisted by the wire mesh only permitting small streamlets of the gaseous products to pass, which are thus more readily cooled below the point of ignition of the gas and the flame extinguished before it can reach the outside of the lamp.

(c) A so-called safety lamp is unsafe when improperly handled by an incompetent person. It is unsafe when improperly assembled or any of its parts omitted, or when the gauze is dirty or injured in any manner, or has become heated so that its cooling effect is destroyed. This happens when the lamp is exposed to a gas-charged atmosphere for too long a period. The lamp is unsafe when exposed to a strong air current or any sudden compression of the air that might blow the flame of the lamp through the gauze.

Milwaukee Auditorium, Where American Mining Congress Sessions Were Held

American Mining Congress in Slim Session at Milwaukee

Devotes Much Time to Coal Industry and Its Problems in Small Convention—Taxation and Labor Relations in Foreground—National Mine-Equipment Exposition Makes Good Appearance

Coal was one of the principal interests at the 26th annual convention of the American Mining Congress at Milwaukee, Wis., Sept. 24 to 29. The sessions gave opportunity for J. C. Brydon, president of the National Coal Association, and other nationally known operator spokesmen to set forth facts about bituminous and anthracite, freely prophesying serious trouble for the bituminous industry next April, when the wage contract expires. Mechanical problems of coal operation, especially with reference to underground loading machines, absorbed a good deal of attention and the machinery show, around which the convention centered, was largely an exposition of coal-mining equipment.

So a good deal of information about coal, from taxation to labor relations, was disseminated, even though the Congress, in its resolutions, mentioned coal but once—favoring a 75c. reduction in ocean freight on coal or any other transportation improvement that will give American coal a better break in export trade. The coal industry asked nothing more in the way of convention action than that.

The convention had a comparatively small attendance—about 1,000 delegates and exhibitors registering, as compared with 2,400 last year—many of the sessions had few participants, and two or three minor ones were cancelled altogether. This and other considerations led the Manufacturers' division of the Congress to recommend that hereafter metal and coal conventions be held separately so that each group could concentrate and so that the convention cities could be in the heart of the particular field involved. This plan no doubt will be adopted. The details have not been worked out yet. It may be that the coal and metal conventions will be on alternate years or both in the same year. It is likely the 1924 convention and machinery show will be in San Francisco for the metal interests.

H. W. Seaman, of Clinton, Iowa, head of the Trojan Mining Co., a gold operation of Deadwood, S. D., was elected to the presidency of the Congress. His forceful personality is expected to be effective for the upbuilding of the Congress. The other officers for the coming year are D. B. Wentz, head of the Wentz Co., of Philadelphia, bituminous and anthracite miners and shippers, first vice-president; E. L. Doheny, of New York, second vice-president; L. S. Cates, of Salt Lake City, Utah, third vice-president. The executive committee is composed of President Seaman, Albert J. Nason, of Chicago, head of an important coal-operating company, and Sidney J. Jennings, of New York, retiring president of the Congress.

It goes without saying that J. F. Callbreath, of Washington, D. C., the energetic and effective secretary for twenty years, was retained. New directors are W. J. Loring of California; Hugh Shirkie, of Indiana; Stanley A. Easton, of Idaho; J. G. Bradley of West Virginia; L. S. Cates, of Utah, and F. S. Morse, of New York.

The main results of the convention, as measured by the official action alone, were several. In the hope of furthering the movement for better labor relations in mining the convention authorized a special committee to work out and put into effect a plan for offering to mining companies a course of training for foremen and bosses aimed to make better informed men of that important class of connecting links between employer and employee. If the mine operator is honest in his effort to cultivate the good will of his men and to give them a square deal all the time, it is thought that the foremen are the best agencies through which to work. If they understand the fair-minded operator's position they are one important defence against insidious attack by labor propagandists.

The Congress also favors some form of immigration restriction that will let in all the desirable aliens and keep out of this country the undesirables, as an aid to meeting man shortage in mining. This resolution was passed in spite of a declaration in an address by E. J. Henning, Assistant Secretary of Labor, that selective immigration cannot be made operative.

The Congress resolved in favor of a general investigation of the gold situation in this country to determine whether the gold reserve is too small and whether the Treasury Department's policy of selling gold into commerce at what is said to be less than the cost of production, should be discontinued. A committee is to be appointed to study the matter.

Other resolutions protested against government interference in business, called for better efficiency and less needless waste in state and local government to reduce taxation, reaffirmed the Congress' position against selling the Muscle Shoals government power plant to Henry Ford, a sale which the Congress would construe as an indication of unsound government policy on Southern water-power development, taxation resolutions mentioned later in this report, and various lesser ones.

The convention centered its attention upon industrial operation, standardization of mining methods and equipment, taxation, oil shale, and mechanical problems of min-

ing. The latter were considered mainly in "open forums" held every afternoon where discussions could be full and free. Some of them were entirely satisfactory in spite of battalions of empty chairs. An industrial co-operation dinner was held Tuesday evening the 25th, a vaudeville entertainment by the exhibitors was given Wednesday evening where graceful legs twinkled, and where jazz band music, song and funny story strove more or less futilely for attention amid a happy but entirely respectable hubbub, and a banquet Friday evening closed the convention.

Although delegates and attendants of the Congress' convention began reaching Milwaukee as early as Friday, the 21st, the convention did not formally open until Monday night, the 24th, as reported in last week's issue of this paper. On a band stand in the side balcony at the Auditorium, overlooking the comparatively quiet machinery and equipment exhibits, Max W. Babb, vice-president of the Allis-Chalmers Manufacturing Co., introduced Mayor Daniel W. Hoan, who welcomed the Congress on behalf of the city, and E. L. Phillips, a former Wisconsin Governor, on behalf of the Milwaukee Association of Commerce. The good feeling of the mining interests and government of Mexico toward the Congress was expressed by Señor Moises Perogordo y Lasso, representing the Mexican Department of Commerce, Industry and Labor, and by Señor F. Roel, Mexican Consul General.

CO-OPERATION MESSAGE FROM PRESIDENT COOLIDGE

Sidney Jennings, president of the Congress, who is head of the United States Smelting & Refining Co., of New York, responded gracefully to the various welcomes and then read a short message from President Coolidge in which the nation's chief remarked upon the importance of mining in this country, urged everybody concerned in mining to co-operate fully to reduce both economic waste and loss of life in the industry and closed by extending his good wishes to the Congress and "my congratulations on the prospect for a long session of improving business conditions." Then Mr. Jennings formally declared the convention and its attendant machinery show open.

Beginning Tuesday each morning of the week was given over to a general session of the convention while the afternoons were devoted to two or more separate divisional meetings, and open forums on practical equipment problems.

At the Tuesday morning general session President Jennings read his annual report, summarized in these columns last week. It was an appeal for less waste in mining, for better labor relations, and a short review of the work that had been done by the several divisions of the Congress during the year. He said that although the Congress had entered the year with a deficit, the receipts totaled \$179,000 and the deficit had been practically wiped out.

A dark picture of the anthracite situation and its future was painted by E. W. Parker, director of the Anthracite Bureau of Information, of Philadelphia. That accomplished publicist said his industry has just suffered a violent attack of "governmentitis," has a hangover of indigestion and will no doubt continue to suffer from it for years. The misrepresentations about anthracite, he deplored. This keeps up even though the average investment in anthracite plants per ton of coal produced is \$8.50, according to R. V. Norris, an independent engineer, and the average profit is but 25c., or only about 3 per cent. Yet anthracite operators are condemned as robbers fattening gluttonously off of a helpless public, and a few special cases, unfortunate for but not representative of the industry, have given basis for the charge.

Mr. Parker had much gentle sarcasm—and some not so gentle—for the U. S. Coal Commission. He cited an instance of the publication of the fact that the average realization on anthracite during the last quarter of 1922—naturally the best quarter of the year for the industry, and the one which levels up earlier low spots—was \$1.05. The public got the impression that this is a constant average. An investigator for the Commission told Mr. Parker he had prepared a long-term average which should have been used for the purpose, but which wasn't.

He spoke with feeling about the Pinchot settlement of the recent strike. Governor Pinchot found after four days'

study that the miners ought to have 10 per cent more pay, though the Coal Commission, after six months of it, had said wages were high enough. Mr. Parker observed that, while the Governor proposed ways of absorbing the increased cost of anthracite, there was no suggestion that the state's anthracite tax be reduced.

The anthracite industry must soon go into a period of decline, he said, because the available supply is decreasing and there are no more deposits to exploit.

Reverting to the Commission's report, Mr. Parker could not refrain from saying he noticed that the Commission didn't appear to have much confidence in the Federal Trade Commission, or it would not have proposed that coal be put into the hands of the Interstate Commerce Commission. He said it was gratifying, however, that no new bureau was suggested, for what this country needs now is fewer bureaus and more sideboards.

The smokeless coal region operators are disappointed in the work of the Commission, George A. Wulff, secretary of the Winding Gulf Operators Association, said. His members last year voted by only a narrow margin to furnish statistics to the Commission, but those statistics and a good many recommendations were supplied fully and freely.

"We had a notion this week," said he, "to request that the information be sent back to us. I believe it surely would have come back in the original packages. The Commission must never have even opened them or it wouldn't have drawn some of the conclusions it did." The smokeless operators do not feel like submitting without a court trial to some of the Commission's proposals for control of coal, he said.

About forty men attended the Tuesday afternoon meeting of the industrial co-operation division, where the important question of labor relations was discussed. The conclusion to be drawn from the meeting was that the most important things that can be done just now to put more harmony into such relations are: First, for the employers to develop in their own breasts an honest desire to see their workmen get an absolutely square deal, and second, to convince foremen and mine bosses of that and train them how to handle the men they boss.

WORKS FOR BETTERMENT OF LABOR RELATIONS

Some active work has been done during the past year by the Congress to further the cause of better relations. W. A. Grieves, of the Jeffrey Manufacturing Co., chairman of the industrial co-operative division of the Congress, read a report showing that in twenty-eight states subcommittees have made surveys, are encouraging such co-operation between men and employers and are telling the public about it. Mr. Grieves said the average mine operator has just a little bit more desire to set up good feeling and mutual understanding between himself and his men than the average factory owner has. But the public does not believe it. Various agencies, stimulated mainly by professional union leaders, have spread the spirit of discontent as far as possible by misrepresenting the operator. But mining is said to have 50 per cent too many men in it still, which indicates that the conditions therein must not be so bad after all or men would not stick.

Mr. Grieves read a questionnaire which has been sent out to employers, and summarized the responses. This indicated, among other things, that out of a group of sixty-two replies, twenty-eight have a definite and complete plan of industrial relations working and only eight are not entirely satisfied with their results. Mr. Grieves urged that the Congress put someone permanently in charge of promoting industrial relations, for it is a big job and well worth the whole time of a good man.

Norman W. Schlichter, a man who has circulated for twenty years through many industries to encourage better relations between employer and employee, declared the American public believes that nine-tenths of industrial management is wrong and that labor is nine-tenths right. This is due, he said, to propaganda put across by publicists, preachers and reformers at the instance of union leaders. This thing is growing, because labor leaders have learned that the insistent voice is the one that is believed.

Resolutions Passed by the American Mining Congress

Favoring appointment of a committee to develop and put into service a training course for foremen and other section executives in coal, metal and other mining industries.

Favoring appointment of a committee to investigate the present gold situation and to recommend such measures as seem best able to protect the gold standard in the United States and throughout the world.

Favoring selective immigration, operative prior to embarkation, or such other procedure if a better plan be proposed, as will tend to increase the proportion of workers among aliens admitted to the United States to the end that mining and other industries may have a better labor supply.

Favoring co-operation in any transportation movement which will benefit the bituminous-coal industry of the United States in its export trade, investigation showing that if rates on overseas shipments of coal were lowered 75c. a ton America could compete with Great Britain.

Favoring uniformity of blue-sky laws, aid for small operator

to help him raise capital, and condemnation of "the intent and purpose of such measures as the Denison blue-sky bill."

Denying that the producers of silver seek an unfair interpretation of the Pittman Act in their protest against the Treasury Department's revoking of silver allotments for subsidiary coinage.

Tendering the support of the Congress to the movement for the organization of a silver export association.

Urging the reduction of state and local taxes, abolition of all double and super taxation and the creation of a tax court of appeals to work independent of the Bureau of Internal Revenue at Washington.

Reaffirming the 1922 position of the Congress in favor of a sound economic policy for the development of water power in the South to prevent power monopoly.

Urging a joint commission to facilitate the co-operation of this country with Mexico in the development of Mexican mining properties.

Employers must be the ones to raise that insistent voice in the future if they would retain control of their own industries and property. The truth about the present industrial order must be put across to the public. By publicity, missionary work and through good, wholesome and honest relations with labor, they must teach their labor the origin of capital, the political rights of labor and the improvement that labor has made under the existing system in this country. This, he said, can best be done through training of foremen and bosses.

Secretary Callbreath of the Congress emphasized the importance of foremen training. By a vote of the meeting a subcommittee was created to consider and report on whether the Congress should prepare and offer such a course. A. B. Jessup, of the anthracite wage scale committee; Mr. Wulff and George R. Stahl, of Denver, Colo., named on that subcommittee, reported that evening to the Congress at the industrial co-operation dinner that a permanent committee be created to work out a plan and put it into effect during the coming year.

The 200 men and women at the industrial co-operation dinner heard a good deal about the unreasonableness of union labor from Lawrence F. Abbott, publisher of *The Outlook*. Mr. Abbott spoke with keenness and good humor about the difficulties of employing union pressmen.

He thinks it probable that the early abuse of power by capital is what turned the union into a fighting organization, but whatever the reason, capital now should do everything it can to remove the causes of the present state of war. Arbitration and employees' elective representation in industry are the best methods. But they cannot succeed in mining unless mine operators get thoroughly sold on the idea of reciprocal relations. There is no other road to permanent industrial peace.

DEFENDS EXISTING SYSTEM OF IMMIGRATION CONTROL

A defence of the present system of immigration control was offered by Edward J. Henning, Assistant Secretary of Labor at Washington. Mr. Henning put a good deal of force into his talk and held his audience well. He deplored the fact that so many big employers want unrestricted immigration, saying that cheap labor of the sort admitted with the Ellis Island bars clear down is merely European refuse and is, in the long run, the most wasteful, most undependable and most expensive labor there is, not to mention its unhealthy effect upon the blood and stamina of the nation.

Selective immigration, so much desired by many other employers, cannot be practiced, he said, because of the national pride of the other countries. He said the only sound answer to the present shortage of labor is limited immigration, a better distribution of the labor already in this country and more manual training for the upcoming generations.

Wednesday morning's general session centered upon problems of the coal industry. Albert J. Nason, head of the Illinois Coal Corporation, presided. The first address was that of John C. Brydon, president of the National Coal Association, which appeared in full in last week's issue of *Coal Age*. Phil H. Penna, secretary of the Indiana Bitu-

minous Operators Association and a warhorse of national importance for a generation in the dealings between mine owners and miners, was scheduled to speak on "The Position of the Operators in the Central Competitive Field." He opened by declaring no man can tell what is the position of the Central Field operators for they do not themselves know from day to day, and that it is seldom possible for them to get a majority vote on anything. However, they come nearer agreeing upon the fact that the control of their own industry has been taken away from them than upon any other one thing. Collective bargaining in what remains of the field—part of Ohio, and all of Indiana and Illinois—while not perfect, has proved the best method that could be devised, he declared, and not only operators and miners but the public has benefited by it.

MINERS' UNION USING UPLIFTERS AND POLITICIANS

The only trouble with it now, he insisted, has nothing whatever to do with the method, but is that the miners' union has been able to make profitable use of the "damnable uplifters and truculent politicians" who have upset calm negotiation between men and operators. There is no such thing any more as real collective bargaining, he said.

In 1916 there was, though. Operators and miners then were able to make their own contracts and a certain large group of coal contracts made during that year showed Indiana lump averaging \$1.30 to the consumer, and screenings 80c. But since then the miners have learned that what they cannot get from the operators they can get from politicians at Washington. The effect of this on the price of coal to the consumer is known to everybody. The non-union policies that West Virginia, Alabama and other fields cling to so tenaciously now will some day prove the salvation of the whole industry, he declared.

In the Central Competitive Field there is no hope for relief soon from union domination, Mr. Penna said.

Mr. Penna knows a cure for all these labor ills in coal. Here it is: "If we all considered the rights of others and were willing to fight for our own rights, the problems would be solved. Unfortunately, in operators' ranks, there are always some who can see only the dollar. They wouldn't fight for their own rights, nor respect the rights of their employees. It is men like that who have forced the union to develop into the dominating thing it is today. But there they are, in the industry, and because of them it is necessary for others to be fighting labor all the time, foolish though that practice is.

"Some day the people of this country will get so tired of this fighting at their expense that a revival of true Americanism will occur—the kind of Americanism that makes a man give a square deal to all others and insist upon a square deal for himself. Then we'll have men in Washington with backbone enough to enforce the Constitution. The authority of the nation will recognize the right of men to organize and to refuse to work when they want to; and it will recognize the equally sacred right of men to remain unorganized and will protect them in that position. All this is merely 100 per cent Americanism."

An appeal that the truth about coal be told the public was made by F. D. Rash, of the St. Bernard Mining Co., of Kentucky. He was scheduled to talk about the relation of

transportation to the coal industry, but dismissed the subject of transportation with a brief word about the unbalanced condition of freight rates and then turned to labor and the interference of the politicians in coal problems. He said the volume of "bunk" handed the people of this country during every coal crisis is stupendous and often comes from such high places as to be severely damaging.

Anthracite came to the fore in the extempore speech of A. B. Jessup, of the recent anthracite wage-scale committee. He opened with a little more sarcasm for the U. S. Coal Commission by saying that public expenditures such as the \$600,000 spent by the Commission without result are good reasons for the depreciation of the value of the dollar.

Mr. Jessup declared government interference in the recent settlement of the anthracite strike gave the miners more than 100 per cent more than they really expected. He said the best they had hoped for was a 5-per cent increase in wages and this only on a long-term contract. But Washington passed the buck to Harrisburg and Governor Pinchot told the miners they were entitled to 10 per cent more pay because of the skill required by their work and the hazards of it.

A luncheon at noon for exhibitors and members of the Manufacturers' division of the Congress and a hilarious exhibitors' entertainment in the basement of the Auditorium that night wound up Wednesday's proceedings.

ATTACKS TREASURY'S WAY OF COMPUTING DEPLETION

Taxation got a good deal of attention during the convention, in several sessions of the taxation division. Paul Armitage, of New York City, one of the noted authorities on mine taxation and chairman of the general tax committee of the Congress, charged that the Treasury Department's only method of computing depletion is in disregard of the express terms of the law, which provides that a reasonable allowance for depletion and depreciation of improvements shall be granted according to the peculiar conditions of each case.

Wade Kurtz, of Joplin, Mo., reiterated the charge made previously that the government ignores established accounting practice, built up before income-tax laws were heard of, to meet the needs of short-life operations. He urged a protest against the rapid crystallization of ill-advised decisions by rules for which no official apparently is responsible. He said if the department would deal with actualities and not with fictions, they would get cases settled more promptly.

That the discoverer of a mine is justly entitled to a value for discovery which may be returned as capital representing the years of toil, hardship and expense in prospecting, exploration and development of the mine, is the view of George E. H. Goodner, of Washington. Mr. Goodner explained the discovery provision of the 1921 revenue act which has given the government as well as taxpayers much difficulty. This is another provision of law which the income tax unit partly ignores and thus defeats the expressed intent of Congress.

In the final tax conference of Friday, Walter A. Staub, of New York, explained many of the changes that have been made in the 1921 revenue act with reference to reorganizations, pointing out a number of conditions under which it would be of advantage for mining corporations to reorganize if they own property carried on the books at less than the present value and which are therefore unable to profit fully by depletion and depreciation allowances. Arnold R. Baar, of Chicago, spoke on taxation of dividends and other corporate distributions with particular reference to distributions from capital, from depreciation and depletion reserves, and from realized or unrealized appreciation in value of capital assets. All the taxation papers have been printed in pamphlet form by the Congress.

At the banquet closing the convention Friday night W. H. Finley, president of the Chicago & Northwestern Ry., made an appeal for a reduction in the legislative restrictions thrown around the railroads of the country, and declared that since wages form 80 per cent of all railroad expenditures, freight rates should not be reduced until wages come down.

Senator Irvine L. Lenroot, in his address on "Government in Business," said there is a powerful effort now being made to sovietize this country that has already led to an economic unbalancing by which one class tries to take all and leave nothing for the remainder of the people. This will eventually prevent prosperity. He appealed to the business interests of this country to take an interest in their government, not merely to satisfy their own immediate desires but with the future of the nation in mind. The best basis he can think of for this is an intelligent co-operation with labor and agriculture.

The technical side of the convention and the very good machinery exposition will be treated in a later issue of *Coal Age*.

Underground Loading Machines a Live Topic at Mining Congress

Failure to Provide Cars Fast Enough Handicap to Success—Modified Mining System Suggested—Concentration of Workings Cuts Operating Expense

Underground loading machines—the liveliest mechanical subject of the convention of the American Mining Congress—came in for discussion at the Thursday afternoon standardization conference after D. J. Carroll, engineer for the Chicago, Wilmington & Franklin Coal Co., had read a short report of the Congress' committee on mining and loading equipment. He said the committee made a futile effort to collect some complete data on the loaders now in service, and got reports on only 29 machines. In the discussion that followed it developed that there are nearly 200 loaders of various kinds now in service in the country, which moved Colonel W. R. Roberts, chairman of the standardization division, to say that the country has not waked up yet to the swift spread of these machines.

In his report Mr. Carroll said 24 of the 29 machines covered in his committee's scattered survey are Joys, 4 are Myers-Whaleys and one is a Goodman whose service has been discontinued. The two qualifications machines must meet, he said, are that they must not break down coal more than hand loading and they must stand the gaff of wear and tear. He stated it as the committee's opinion that the price of loaders must be lower. Machines now range from \$5,600 to \$9,000, which makes the average about \$7,500. A wage scale for machine operators is going to be hard to get. The present temporary arrangements in union fields cannot be maintained much longer. But cutting machines were recognized by the union after a long fight and loaders will win also.

N. D. Levin, chief engineer of the Jeffrey Manufacturing Co.'s mining department, said the biggest obstacle in the loading machine's way is the failure of operators to devise a scheme for getting cars to them fast enough. He doubts if it ever can be done on a room and pillar system. He thinks the mining system must be changed so that a loader can stay in one place and work continuously for a whole shift.

Mr. Carroll, who was about the only man to talk for the operators in the conference of about 50 machinery men, said the mine cannot afford to change its system until the machine has proved itself worthy of it, which it has not yet done. The best machine performance he had ever heard of was 150 tons a day. In Orient No. 2 mine of his own company, where there are 13 loaders—the largest single installation in the world—the best of them have loaded only 45 tons a day.

William Whaley, president of the Myers-Whaley Co., of Knoxville, Tenn., said one reason for such small production per machine was the fact that all of the machines in Orient No. 2 are on narrow entry work. In a lignite mine in Colorado, he said, one of his company's loaders averages 100 tons a day—a bulk greater than that of 100 tons of bituminous coal—and one in Tennessee, operating under perfect conditions, regularly loads 150 tons working only about 60 per cent of the time. This indicates that the loader, if given a chance, can get out a tremendous tonnage. In wide work a loader ought to handle 200 tons a day some

day soon, he said. Anything less than 100 tons a day is uneconomical. Training of crews is one way he advocated of raising the capacity of a machine.

Mr. Levin took the floor a few minutes to suggest that machines could be used to advantage in a modified room and pillar system if rooms were widened out to 200 ft. or more, supporting the roof with jacks when necessary. This would enable the loader to stay a whole shift in one place. Tonnage ought to be raised to 300 a day by that method.

The question of breakage by machines was raised. Mr. Levin said a loader his company had once maintained an average of 70 per cent of coal above 1½-in. size. Mr. Joy said his machines, working in the Pittsburgh seam, get as high as 70 per cent lump now.

The Joy machine is calculated for room and pillar work now, but the head of the concern guessed that eventually some other system will be adopted to increase not only the output of loaders but of cutting machines too. Cutters ought some day to cut as much as 600 tons a day, he thinks.

He explained the low tonnage performance of the Joys in the Orient mine—about 45 tons average—by the fact that they are able to run only about 20 per cent of the time. This is the lowest output of any of the 150 or 160 Joys in the country and they require more repairs than any others of the 52 working in the Middle West. The union labor handling the machines has absolutely no consideration for them, he said.

Defending the high cost of loaders, he declared operators have told him they save enough in miners' houses alone, where they reduce working forces by the use of loaders, to pay for the loaders. Loaders, he said, concentrate the working area of a mine to half the expanse operated ordinarily without them, thus effecting great economies of trackage, wiring, haulage time and power consumption. They also reduce the amount of timber used for props because a face is advanced so fast that roofs do not have so much time to weaken.

Governor Smith Begins State Coal Inquiry

Beginning an inquiry into the fuel situation in New York State Governor Smith on Sept. 30 asked Edwin J. O'Malley, Commissioner of Markets of New York City, and the men who acted as County Fuel Administrators for the State Fuel Administration last winter to supply information as to the anthracite supply, the prices being charged and for evidence of profiteering.

In his letter to Commissioner O'Malley the Governor said: "I am endeavoring to gauge the coal situation as it affects the State of New York and I shall appreciate your assistance in securing and forwarding to me at the earliest possible moment specific information on conditions in the City of New York."

George J. Eltz will represent the Coal Merchants Association of New York City in the efforts being made by the Department of Public Markets of the city to insure a supply of anthracite domestic coals and stability of prices, according to an announcement issued Sept. 28 by Mrs. Louis Reed Welzmler, Deputy Commissioner of Markets. Mrs. Reed Welzmler has been conducting an investigation of the coal situation, fearing a serious shortage of domestic coals, and late in the week announced that arrangements had been made whereby householders could obtain a supply of coal and that efforts would be made to urge the operators to allocate a larger proportion of the output to New York City. There also was made public at the investigation a schedule of mine prices of several operators for domestic coals. They follow:

	Egg	Stove	Nut	Pea
D. L. & W.	\$8.75	\$8.75	\$8.75	\$6.25
Lehigh & Wilkes-Barre	8.75	8.75	8.75	6.25
Lehigh Valley	8.75	8.90	8.90	6.35
W. & P. (Erie)	8.95	8.95	8.95	6.15
Delaware & Hudson	9.00	9.00	9.00	6.15
P. & R.	9.15	9.15	9.15	6.60
L. C. & N.	9.25	9.25	9.25	6.50
D. & E. (O. & W.)	9.25	9.25	9.25	6.65
Weston Dodson	9.75	9.75	9.75	7.50
Hanna (Sus.)	9.85	9.85	9.85	6.75
Thorne Neale	10.25	10.25	10.25	7.40
Markle	10.45	10.45	10.45	7.50
Buckwheat, 1st Quality, \$3.50	Buckwheat, 2d Quality, \$2.50	Buckwheat, 3d Quality, \$1.50		

Lewis Condemns Coal Commission As "Most Inefficient of All"

Declares It a "Lamentable Failure"—Says
Its Recommendations "Fail to Ecompass One
Great Object for Which It Was Created"

The U. S. Coal Commission has failed lamentably to help the coal industry and its recommendations "fail to accomplish the one great object for which it was created," according to a press dispatch of a statement by John L. Lewis, International president of the United Mine Workers, issued at his home in Springfield, Ill., Sept. 28. The death of the Commission, which expired Sept. 22, leaves the industry suffering from the same ailments and ills as was the case preceding its creation, the statement declares, adding that it will "go down in history as being perhaps the most inefficient of all federal commissions."

President Lewis' statement follows:

"The taxpayers of the nation should be deeply gratified to know that the life of the U. S. Coal Commission legally expired Sept. 22. The Commission has been in existence for a year and has succeeded in expending more than \$600,000 of the people's money. The work of the Commission in so far as the coal industry is concerned is a lamentable failure and has not even justified the existence of the Commission or the funds expended. Its report is a maze of well-worn generalities which could have been written by any well-informed mine superintendent within a sixty-day period.

"The Commission's recommendations fail to encompass the one great object for which it was created, namely, the stabilization of the coal industry as affecting both the opportunity for employment on the part of the miner, reasonable profits for the operator and a fair price of coal to the consumer.

"The death of the Commission leaves the industry suffering from the same ailments and ills as was the case preceding its creation by congressional enactment. It will go down in history as being, perhaps, the most inefficient of all federal commissions from which our country has suffered. It has, however, furnished positions of public distinction to a number of excellent gentlemen who know less about the coal industry than when they started investigating a year ago.

"The Commission surrounded itself with a large corps of needy college professors and so-called experts of the intellectual variety, who wrote reams of staff reports which have been from time to time given publicity. It is generally conceded that one can prove anything he chooses by reference to these staff reports.

"The fact that many of these reports contradict each other seems to rest very lightly on the shoulders of the Commission. The fact that these reports contain mis-statements due to a woeful lack of knowledge on specific subjects is also of small concern to the Commission. The final report of the Commission should be duly filed and the dust of the ages allowed to collect thereon."

MEETINGS OF THE DIRECTORS and of committees of the National Coal Association, and of secretaries of member associations have been definitely arranged to be held at the Hotel Biltmore, New York, as follows: Policy Committee, 9:30 a.m., Tuesday, Oct. 9; Government Relations Committee, 12 noon, Tuesday, Oct. 9; Membership Committee, 2:30 p.m. Tuesday, Oct. 9; conference of secretaries, 3:30 p.m. Tuesday, Oct. 9; Directors, 9:30 a.m., Wednesday, Oct. 10; Publicity Committee, 12 noon, Wednesday, Oct. 10.

A MINING RECORD TO SHOOT AT.—Peter Stark, who has just completed seventy-five years' work at Thankerton colliery, Holytown, Lanarkshire, claims to be the oldest working miner in Great Britain. He has been employed in the colliery since he was nine years old and although is eighty-four years old, is still quite hale and hearty, and continues at his work. Mr. Stark can recall the time when women were employed in the mines.

Dr. Honnold Resigns Secretaryship of Illinois Operators' Association

Dr. F. C. Honnold, moving spirit of the Illinois Coal Operators' Association, offered his resignation as secretary-treasurer of the organization at its annual meeting in Chicago Tuesday. He has been willing to resign at previous annual meetings but the association has always prevailed upon him to continue the effective work in statistics and publicity which he has carried on to the great good of the organization. This time he told his associates, before the meeting, that his decision was final; so the association had no choice but to acquiesce. Rice Miller retains the presidency; Vice-President L. H. Smith has succeeded Dr. Honnold as treasurer and C. E. McLaughlin is the new secretary.

Dr. Honnold will remain a member. He is now the head of the Honnold Coal Bureau, a private enterprise collecting, compiling and distributing to operator clients data on production and distribution of coal in southern Illinois, a work which once as handled as a part of the association's services.

The association also was expected to go through the formality of approving the creation of a central policy committee to handle for the three Illinois associations all questions of labor, operators' relations and general policy both within the state and between Illinois and other states. The plan already is approved by the other two associations and by the executive committee of this association. The members are to be these: For the Illinois Operators' Association, President Rice Miller, L. H. Smith, E. C. Searls, W. J. Spencer and James Needham; for the Fifth and Ninth Districts Operators' Association, President C. S. Krause and Herman Perry; for the Central Illinois Operators' Association, President H. C. Adams.

Court Upholds Sale of Lehigh Coal Stock

A final decree in the sale of the stock of the Lehigh & Wilkes-Barre Coal Co. has been filed by the U. S. District Court at Philadelphia. The court dismisses the objections of Isaac T. and Mary T. W. Starr, minority stockholders of the Central Railroad of New Jersey, to the sale of the stock of the Lehigh & Wilkes-Barre Coal Co. to the Jackson E. Reynolds Syndicate of New York.

The decree, signed by Circuit Court Judges Buffington and Wooley and District Judge Thompson, is based on the recent decision of the court that it would not set aside the sale because the evidence had showed it was made in good faith and in conformity with the U. S. Supreme Court decree for the dissolution of the Reading and its associated companies.

Sixty days from Oct. 1 are allowed for the filing of an appeal from the decree.

Crowell Urges Release of Coal Commission Report on Retail Trade

Samuel B. Crowell, president of the National Retail Coal Merchants Association, in a letter to former Chairman Hammond of the U. S. Coal Commission Oct. 1, urged immediate release of the Commission's report on the retail coal trade, believing "that the public interest demands that your findings concerning the retail coal trade and any recommendations you may have seen fit to make, should be given publicity."

"It has been stated," continues Mr. Crowell's letter, "that the question of retail coal prices is a problem of the 'state' rather than the federal government, and that the Governor of each anthracite-consuming state is appropriately interested to determine whether fair prices on coal prevail within his jurisdiction and is properly desirous of correcting any improper conditions that may exist. As representing the retail coal dealers I therefore urge immediate release of this report, believing that its value will be enhanced by prompt circulation."

"I take this opportunity to state that our association has

welcomed the investigation of your body and is confident that your report will show that the retail coal business is a highly competitive business, conducted under difficult conditions and that the retail coal dealer is rendering a valuable service to his community, efficiently and with full regard for the public interest."

Hudson Coal Co. Workers Place Grievances In Hands of District Union Officials

Urged by Enoch Williams, secretary-treasurer of District 1, United Mine Workers, general grievance committee-men of the Hudson Coal Co. voted on Sept. 29 to place their grievances in the hands of the district union officials for settlement. A general strike in the mines of the Hudson company, affecting 20,000 men, threatened for a while, the workmen alleging that discrimination was shown in the hiring of laborers, and protesting against the inauguration of the "special test," and the refusal of the colliery officials to bring rate sheets up to compliance with the new agreement.

Utilities Consume 3,027,384 Tons of Coal in July; Slight Gain in Power Produced

Electric public-utility plants consumed 3,027,384 net tons of coal during July, according to a report just issued by the U. S. Geological Survey. This compares with 2,953,358 tons consumed during June, according to corrected returns.

Fuel oil consumed by public-utility plants in July totaled 1,161,644 barrels, compared with 1,035,715 barrels in June. The average daily production of electricity by public-utility power plants during July was 146,300,000 kw.-hr., a slight decrease over the rate for June.

The average daily production of electricity for the first seven months of 1923 and the proportion produced by water power were as follows: January, 153,300,000 kw.-hr., 34 per cent; February, 154,400,000 kw.-hr., 33.9 per cent; March, 152,500,000 kw.-hr., 36.3 per cent; April, 149,100,000 kw.-hr., 39.9 per cent, and May, 150,100,000 kw.-hr., 41.3 per cent; June, 151,100,000 kw.-hr., 38.9 per cent.

W. Va.-Ky. Mine, Mechanical and Electrical Engineers Meet at Huntington Oct. 19

The third annual convention of the West Virginia-Kentucky Association of Mine, Mechanical and Electrical Engineers will be held Oct. 19 and 20, at Huntington, W. Va. At the first session, on Friday, J. H. Edwards will speak on "Mechanical and Electrical Equipment Records." There will be a further consideration of "All-Rubber Insulated vs. Ordinary Braid Covered Cables for Portable Extensions, Locomotive and Mining Machine Cables, etc.," and then an open discussion on "Purchased Power vs. Individual Plants."

L. G. Mason, of the Westinghouse Electric & Manufacturing Co., East Pittsburgh, Pa., will speak at the afternoon session on "Construction and Care of Transformers," illustrating his address with slides. "What Can Be Done to Improve the Efficiency of Mine Pumping" will be another subject discussed at the session, and F. M. Reigher will speak on "What Service Are We Getting from Manufacturers in Supplying Repair Parts?"

The morning session on the last day of the convention will be taken up by a business meeting and addresses by M. A. Maxwell on "Hoisting Equipment" and J. J. Fluck on "Application of Fan Drives for Ventilation." An inspection of industrial plants will be made in the afternoon by the delegates.

AMONG THE CASES scheduled for early argument before the U. S. Supreme Court is the case of the Corona Coal Co. against the United States. This case involves the question of the proper basis of settlement for coal requisitioned by the Railroad Administration. It was dismissed by the Court of Claims for want of jurisdiction and an appeal was then taken by the coal company.

Operators Averse to Government Experiments with Their Industry as Suggested in Commission Report

Consumers Disappointed at Getting No Relief from High Prices or Guarantee of Steady Supply—Labor and Producers Object to Publicity of Accounts and Regulation—Supporters Realize Public Regards Report as a Dud

By PAUL WOOTON
Washington Correspondent of *Coal Age*

Opposition in surprising volume has arisen to the recommendations of the U. S. Coal Commission. The objections to the findings of the Commission fall largely into two distinct classes. The public seems to be disappointed because it sees in the report no immediate relief from high prices and no guarantee as to constancy of supply. Labor and the operators object to publicity of accounts and regulation.

The reaction of the public is thought to be due to a considerable extent to the fact it feels that it has been preyed upon by the coal industry—operators, mine workers, wholesalers and retailers. It has not taken time to attempt to fix the degree to which each branch of the industry is culpable. Apparently the majority of the people were in a frame of mind where they wanted to see someone punished. As a result the non-punitive character of the report in no way appeases the thirst for revenge.

The operators do not object so much to the step as they do to its direction. They are not willing to admit the interstate status of coal-mining operations. They do not agree with Governor Marshall in his contention that the essentiality of the railroad car—the property of an interstate carrier—to mining operations is such as to place the whole enterprise under federal jurisdiction. Many operators, if not most of them, interpret their status to be the same as a manufacturer or a merchant and do not admit that the mere fact that they do not warehouse their product before shipping it in interstate commerce affects their legal position.

It is quite certain, say representative operators, that business generally would not submit to licensing by the Interstate Commerce Commission until they had exhausted every legal measure to prevent it. The Interstate Commerce Commission could survey the field and come to the conclusion that there are too many automobile factories and decide to withhold trackage from a new plant. The same procedure could be applied to every industry if it is proposed to exchange the benefits of consolidations for those of general competition. Without passing on the advisability of such a policy, the operators are certain that they do not wish to be picked out for the experiment.

OPERATORS DECRY UNFAIR REGULATION

The thought also is expressed among operators that any regulation would be unfair which does not follow the coal through to the ultimate consumer. The operator contends that he receives a smaller portion of the sum finally realized for the coal than any other branch of the industry. If operators alone are regulated, the chance of reducing the price would be comparatively small. Seventy per cent of the cost of the coal is represented by labor, which offers, they contend, a more fertile field for regulation. The effect of the Commission's report would be, they contend, to subject the operator to more regulation than any other branch of the industry. Moreover they believe that the service demanded by the public is responsible for a substantial portion of the price of coal, one of the elements of cost to which the Commission paid comparatively little attention. It also was pointed out that there are snow birds among the retailers just as there are in the producing branch of the industry. This latter effective contributor to the ultimate consumer's cost would be without regulation.

There also is a generally held opinion that coal can be moved only to its so-called natural market. There can be

no zoning against quality. Unquestionably, it was said, the cost of clothing could be greatly reduced were all men to agree to wear the same kind of cloth. Different needs and different tastes make this impracticable, but not more than any effort to prevent the movement of coal out of its own zone.

The operators admit that there are too many mines, too many mine workers, too many wholesalers, and too many retailers. They also call attention to the fact that there are too many grocers, too many undertakers and that there were too many lawyers when Governor Marshall was admitted to practice in Columbia City, Ind. They agree that great economies could be effected were it possible to reduce all trades and professions to some scientific basis which would save the public the costs of unnecessary overhead. The practical difficulties in the way, however, are regarded as such as to hinder progress along those lines.

PLAN WOULD OVERBURDEN COMMERCE COMMISSION

To vest the authority suggested in the Interstate Commerce Commission, in an opinion expressed in operator circles, would throw upon that agency more work than it could be expected to do. A comparable situation would be to abolish all appellate courts and allow all cases to come to the Supreme Court direct.

Those who think well of the report realize that the public regards it as a dud. They know it would be more popular had it appeared to be a live shell exploding with many casualties. Nevertheless they think it was wise for the Commission to prescribe a gradual cure rather than to make startling promises and attempt to perform a miracle. Consideration had to be given legal obstacles, for instance. Even had the Commission been so inclined, it might have recommended that it be made unlawful for the mine workers to strike. Such a recommendation might have gratified a certain element, but it would have run head on into the very sturdy stone wall which the Constitution of the United States has erected. Various curbs for the United Mine Workers of America might have been suggested but how could they have been put in force in the face of the decision of the Supreme Court of the United States in the Kansas Industrial Court decision, in which it is held that a man cannot be compelled to stay at his work and that wages may not be fixed compulsorily?

Refuse cars to wagon mines was another suggestion, but there again serious legal difficulties were in evidence. There also was the suggestion of giving 100 per cent priority to contracts. This failed to take into account how to supply the needs of the consumer who has failed to get delivery on his contract and who is estopped from purchasing spot coal. The legal obstacles even in requiring publicity of accounts are serious, as already has been demonstrated. The friends of the report believe that any commission of intelligent, honest men would have reached substantially the same conclusions were they to have before them the same evidence and were they to make the same careful analysis of it as was done by the late Commission.

The President is prepared to endorse the recommendations of the Coal Commission. It is stated at the White House that Mr. Coolidge expects to ask Congress to consider the legislation suggested in the report. The President also regards it as desirable that the public learn of the value of substitutes for anthracite. A greater use of other fuels, he believes, offers escape from high anthracite prices.

Production and the Market

Weekly Review

Activity in the coal market is centered in the anthracite situation. Demand for bituminous coal is dull and prices continue to go downward. Steam-coal buyers are practically out of the market in some sections, except when they can obtain coal at bargain prices, and industrial users in some instances have adopted a hand-to-mouth policy. The railroads have practically stopped adding to their reserve stocks, except on old contracts. A slight car shortage is reported in southern West Virginia and eastern Kentucky.

With most of the anthracite mines operating, coal is coming forward in good volume and demand for the domestic sizes is strong. Although the mines did not begin operations until Sept. 19, shipments during the balance of the week are estimated by the Geological Survey to have been 877,000 net tons. According to indications from early returns, during the week ended Sept. 29 they will amount to between 1,800,000 and 1,900,000 net tons.

OUTPUT AND MOVEMENT OF SOFT COAL STILL GOOD

Production of soft coal continues above 11,000,000 net tons weekly, and during the last six weeks has averaged nearly 1,900,000 net tons daily. Movement continues good. There is not much activity in the steel industry and conditions are now being reached when new orders must be received or production must be reduced. On the other hand there are indications that textile plants are facing an upturn but reserve stocks of coal are so large that it will be some time before its effect could be felt in the coal market.

Operators and consumers are closely watching the outcome of the conference of railroad executives on the demands of the train and service brotherhoods for increased pay.

Coal Age Index of spot prices of bituminous coal at the mines declined to 196 on Oct. 1, compared with 200 the previous week. The corresponding average price was \$2.37, a decline of 5c. There were declines in

Pocahontas, southern Illinois, Pittsburgh, Springfield, Kanawha and Standard coals, and increases in eastern and western Kentucky and Clearfield coals.

Weather conditions affected the Chicago market last week, but prices did not soften a great deal notwithstanding the dullness. Both the steam coals and screenings are draggy. Steam coals are the slowest moving in the Ohio markets and there is little hope for imme-

LAKE COAL DUMPED
(Net Tons)

	Week Ended	Season to
	Sept. 24	Sept. 24
Cargo	822,981	21,227,341
Fuel	55,077	1,142,520
Totals	878,058	22,369,861

mediate improvement. Pittsburgh reports no increase in demand and offerings have been increased, resulting in lower prices. Operators are delivering a good tonnage on regular contracts, although some consumers wish smaller shipments. Consumers appear to be without interest. New England's steam-coal market is further depressed, and there are few signs of inquiry during October.

Coke and bituminous screened coals are practically out of the market as substitutes for anthracite. Prices have dropped and there is little inquiry. Welsh anthracite continues to arrive in small quantities.

Estimates of Production (Net Tons)

BITUMINOUS

	1922	1923
Sept. 8	8,791,000	10,485,000
Sept. 15 (a)	9,737,000	11,378,000
Sept. 22 (b)	9,747,000	11,431,000
Daily average	1,625,000	1,905,000

ANTHRACITE

	1922	1923
Sept. 8	51,000	3,000
Sept. 15	1,127,000	2,000
Sept. 22	1,897,000	877,000

COKE

	1922	1923
Sept. 15	124,000	317,000
Sept. 22	139,000	327,000
Calendar year	4,623,000	14,174,000

(a) Subject to revision. (b) Revised from last report

Two contracts of 20,000 tons of coal each for shipment to France by Nov. 15 were reported to have been closed last week. This was regarded by some as indicative of an upturn in foreign demand. Generally, the export market is quiet and inquiries are few. Shipments from Baltimore during the week ended Sept. 22 totaled 11,785 tons, including 576 tons of bunker coal, while during the previous week the total dumpings, including bunkers, amounted to 16,054 tons.

Dumpings at Hampton Roads for all accounts during the week ended Sept. 27 amounted to 256,730 tons, a decrease of 112,423 tons when compared with the previous week.

Dullness Holds in Middlewest

In and around the Chicago market the prevailing dullness of the past two weeks continues. Warm weather has slowed down even the light but steady call for domestic coals, though the prices have not softened a great deal. But screenings have to be given away. Southern Illinois

has sagged to an average of \$1.25, with some unloaded at \$1.10. The top price of scattered sales of this coal is \$1.50. Central Illinois brings about \$1 and Standard district and western Kentucky fines are simply sunk. Much Standard "sells" at 60c. and west Kentucky unwashed screenings does little better. Railroad pressure is forcing the shipment of these coals at any price.

Around Chicago there is little doing in smokeless or anthracite. The new anthracite circulars showing company increases from 75c. to 90c. on the larger sizes have reached this territory. No fresh coal has reached there yet though it is expected daily.

With the close of September conditions are in a chaotic state throughout the southern Illinois field. The order issued by practically every coal carrier in Illinois to the effect that "no bills" would be counted as empties has had a depressing effect and this will directly be the cause of an advance in the price of the sizes that are easiest to move. Lump is moving fairly well, although some mines are long on it, but egg, nut and screenings seem impossible. Some mines have 100 cars of "no bills." Railroad tonnage is light, with mines working from two to four days a week.

Coal Age Index of Spot Prices Bituminous Coal F.O.B. Mines

	1923			1922
	Oct. 1	Sept. 14	Sept. 17	Oct. 2
Index	196	200	200	404
Weighted average price.....	\$2.37	\$2.42	\$2.44	\$4.89

This diagram shows the relative, not the actual, prices on fourteen coals, representative of nearly 90 per cent of the bituminous output of the United States weighted first with respect to the proportions each of slack, prepared and run-of-mine normally shipped, and second, with respect to the tonnage of each normally produced. The average thus obtained was compared with the average for the twelve months ended June, 1914, as 100, after the manner adopted in the report on "Prices of Coal and Coke, 1913, 1918," published by the Geological Survey and the War Industries Board.

The independent mines are doing better than the Association mines, are getting better working time and moving some coal, although the price is much lower.

St. Louis Does Little Business

Conditions in St. Louis proper are disappointing to the coal trade. The public is not buying to the extent that was expected and such coal as is moving is independent high-grade coal. Country domestic business showed a little Standard. Anthracite has no call. Neither has smokeless. Coke shows little activity.

A check-up of dealers shows that several of them are paying less than the circular of \$4.35 for southern Illinois high-grade coal. Country domestic business showed a little improvement for a few days and fell off the last few days of the month. Country steam is not a factor any more. Local wagonload steam picked up, but carload is impossible and nothing is moving to speak of, excepting a little fine sizes to Omaha and Chicago.

Kentucky Prices Sag

Reports from all Kentucky fields show that prepared coal, especially in the larger sizes, is active, while steam coal is general draggy. Steam buyers are showing practically no interest in mine-run in view of the quantity and

quality of screenings available and the prices quoted, while movement of prepared coal to the Lakes and to retailers in various sections is resulting in a plentiful supply of screenings.

Western Kentucky pea and slack is quoted at 70c.@85c. in the Louisville market, with eastern Kentucky non-gas screenings at 85c.@\$1.15; best Harlan gas coal screenings \$1@\$.125; good steam mine-run from both eastern Kentucky and western Kentucky, \$1.75@\$2, gas mine-run, \$1.90@\$2.25.

While a number of operators are trying to talk \$4 and \$4.25 block coal in eastern Kentucky, some are offering as low as \$3.50, for lump sells at \$3@\$3.50 and it isn't easy to sell block for more than lump. The market as a whole is about holding its own except on screenings, which are 10c.@20c. a ton lower for all fields than they were a week ago. Car supply is fairly good, weather conditions favorable, and movement could be much worse.

Nothwest Trade Is Easy

Nobody in the Northwest appears to be worrying just now over any kind of fuel. A wave of warm weather took the life out of even the domestic anthracite business although little of this coal is to be had and dealers are not accepting big orders for it from anybody. The region served by the Head-of-the-Lakes needs only about 400,000 tons more of anthracite and feels dead sure of getting it. Prices have not changed at Duluth on any grade of hard or soft coal.

In Milwaukee, retail anthracite prices took a 50c. jump Oct. 1, notwithstanding the general protest against price and in spite of a state investigation now going on. Rural retail prices went up 70c. on domestic sizes and 20c. on pea. Minneapolis sees nothing cheering in the present situation but looks for a killing frost at any time. This would have the well-known "salutary effect" on a low market in which good southern Illinois lump has been selling for \$3.75, Hocking for \$6@\$6.25 and smokeless for \$6.25@\$6.50.

Receipts at upper lake docks have fallen low. September figures, not yet available, will show that month to have been the least active month of the summer and early fall. Only 35 cargoes of soft coal and none of hard reached Duluth last week. Heavy shipments in July and August have saturated the Northwest. At Milwaukee 630,419 tons of anthracite has already been received. Only 360,070 tons arrived during last year's short season. Soft-coal receipts also are almost as great, already, as they were last year.

Western Trade Is Better

The West feels a little better about coal. Cooler weather has covered the mountain region, where Colorado domestic coals have been moving in good volume and where screenings has not dragged as elsewhere. In Kansas City a better demand for the whole Southwest district is noted, so that prices on the most popular sizes are shading upward, though without a general advance yet. Kansas quotations are: Lump, \$4.50; mine run, \$3.50; screenings, \$2.50@\$2.75. Arkansas semi-anthracite is quoted thus: Lump, \$6.50@\$7; mine-run, \$3.50; screenings, \$1.75@\$2.

Ohio Markets Dull

Weather conditions have placed an important part in the coal situation in Ohio. Smokeless lump and egg and domestic sizes in high-volatile coals in the Cincinnati market are not in heavy demand, but so far have not been hit by the price concessions that have been made to keep other coals moving. So far there are no indications that the stagnation will affect the October quotations. Car supply has been waning and in parts of Kentucky mines have been running on a two-day-a-week basis because of this. Retail quotations range as follows: Pocahontas lump, \$10.50@\$11; run-of-mine, \$7.50@\$8.25; bituminous lump, \$7.50@\$8; run-of-mine, \$6.50@\$7, and slack, \$4.50@\$5.50. Mine quotations for West Virginia 2-in. lump range \$2.50@\$3, and for southeastern Kentucky 2-in. lump, \$2.50@\$2.75.

The Columbus market is quiet in all respects. There has been a let-up in the domestic-coal situation while steam demand is slack because of heavy reserves. Retail stocks are fair and there is not much disposition to increase them at present. Shipments from the Pocahontas and New River fields are being interfered with because of car shortage. The Southern Ohio Coal Exchange reports a production of 183,784 tons from 443 mines during the week ended Sept. 15. Car shortage caused a loss of 9,908 tons and no market a loss of 475,136 tons. Demand for bituminous coal in the Cleveland territory was quiet during the past ten days, some asserting that it has been many months since so few inquiries were received. Industrial plants that filled their bins because of the anthracite situation are now consuming that surplus. It is also suggested that the slack demand may be due to decreased operations, as well as the belief that bituminous coal will be available at present prices for some time to come. Car supply in the eastern Ohio field is adequate for all requirements.

Demand for coal in the Pittsburgh district does not seem to have increased. Offerings have increased, however, as operators run out of the extra orders they took in August, where there was some forward buying by usual hand-to-mouth buyers. There has been a disposition on the part of consumers with contracts to take smaller tonnages during this month, the most conspicuous instances by byproduct coke interests, some of whom are cutting down tonnages by 10 to 20 per cent. Increased offerings have affected prices and prices for slack have reached new low levels, sales having been made at less than at any time since last year's coal strike started.

Operators in central Pennsylvania declare that prices are down to rock bottom and in some instances below the cost of production. Business is dull. Offering at Buffalo are plentiful but demand is slow, with no indications of immediate improvement.

New England Market Depressed

In New England the steam-coal market is still further depressed. There are few signs of inquiry during October, and it almost seems as if the trade could not be in worse spirits than now. Pocahontas and New River are now freely quoted at \$4.90 per gross ton f.o.b. Hampton Roads for No. 1 grades, and several agencies have intimated that \$4.75 would be accepted.

While there are indications now that the textile industry is looking up somewhat, the reserves of coal are large all along the line. In some of the cotton centers water is very low and this probably will be reflected later on in better inquiry for coal. However, it will be hard to see results from this until a month or two hence.

Both all-rail and by water there is virtual stagnation so far as spot deliveries are concerned. Factors who have coal afloat or in transit seeking the market may find hard going and today there are no bright spots anywhere.

A much reduced tonnage is being dumped at the New York and Philadelphia piers. A certain amount of contract coal is being shipped, especially to the railroads but for the industries generally in this territory movement is extremely light.

Seaboard Soft-Coal Market Slow

While the spot market for bituminous coal is quiet at New York, contract coals are moving in fair volume,

although some consumers holding contracts have asked that deliveries be lightened. The cheaper coals are scarce at the New York tidewater, most of the demand being for the better grades because of the low prices prevailing. At Philadelphia there is no activity. Prices remain soft and there are signs that they may go lower. Some distress coal is available. The railroads are storing coal on account of old orders. The market at Baltimore is flat, dealers reporting few orders. Dullness is apparent in West Virginia, with spot buying on a more restricted scale in all sections. Although car supply is ample for the needs of most mines there are instances, particularly on branch lines where mines are being handicapped by irregular supply. Production is being maintained largely by contracts, particularly those with the railroads.

Spot business at Birmingham is extremely light. Competition is keen and the smaller producers with no contracts are making some business at low prices. Operating conditions are being maintained in many instances because of contracts with railroads, utilities and industrial plants.

Soft-coal movement from Lake Erie ports during the week ended Sept. 23 were 878,058 net tons, as compared with 843,370 tons the previous week, an increase of 34,688 tons. Dumpings during the corresponding week of 1922 totaled 1,453,684 tons with cumulative shipments of cargo coal during the present season to Sept. 23 amounting to 21,274,219 tons, as compared with 17,690,177 tons in the corresponding period of 1921. There was no anthracite shipped by the Lakes during the week ended Sept. 23, the total shipments during the season to that date amounting to 2,375,212 net tons, which was approximately 1,000,000 tons less than in the corresponding period of 1921.

Anthracite Domestic Coals in Demand

All the larger companies having announced their new schedule of prices for domestic coals, the larger retail dealers at New York advanced their prices 75c. per ton to \$14.25 for the larger sizes. Demand for the domestic coals continues strong, but local retail dealers are not inclined to pay the high prices quoted by some of the smaller producers. While some quotations as high as \$13 were made late in the week the general market ranged between \$12 and \$12.25. Pea coal was easier, while the steam sizes were hard to move at company circular. Shipments are coming forward in fair volume. At Philadelphia consumers are not urging deliveries as strongly as a few weeks ago and in some instances when deliveries are made the coal is refused, the consumer saying he had gotten coal from another source or is in no hurry for it now. Stove and chestnut sizes are mostly in demand. Steam coal movement is slow. Quotations by one retail concern are: Egg, \$15.75; stove, \$16.25; chestnut, \$16, and pea coal, \$12.25. One New York retail concern received a cargo of Welsh anthracite last week which will be sold to consumers at the same price as domestic anthracite.

Foreign Market And Export News

British Coal Prices Show Slight Decline; Market Outlook Better

There was a decrease of 75,000 tons in the coal production of Great Britain's mines during the week ended Sept. 15, a cable to *Coal Age* reporting the output to have been 5,245,000 tons, as compared with 5,320,000 tons the previous week.

Stormy weather seriously interfered with loading and caused losses in mining. Quotations show decreases.

The Welsh coal market is quiet again. The trouble between Italy and Greece, contrary to the general expectation had an adverse effect on the trade by leading to the practical withdrawal for several days of Greek tonnage, due to the fact that underwriters require heavy war risk premiums in respect of Greek steamers and their cargoes.

The situation in the United States anthracite field did not have any material effect on the Welsh market; a few market-testing inquiries coming through. There is plenty of coal of all kinds, the market is decidedly weak but operators indicate advanced figures for forward positions.

Anthracite is scarce and is bringing high prices. Unbroken large is 52s. 6d. per ton, and machine-broken cobbles and nuts 65s.

The Newcastle market is improving. Merchants holding coal are willing to sell at present prices, which show a considerable advance on those of August, but they hesitate about accepting business for October until they see how the market is going to shape.

Little has come of American inquiries, but the European market is expanding and business is brightening. All the best grades of steam and gas coals are heavily booked through this month.

Hampton Roads Prices Low

Business at Hampton Roads last week was slack, with exports dwindling in volume and general movement at the piers falling off. Shippers attributed the dullness to the disposition of consumers to use up supplies they were stocked with in anticipation of a prolonged strike in the anthracite region.

Domestic business showed improvement, while the coastwise trade held its own, with brighter prospects for the immediate future. The bunker business was normal, and showing promise of getting the benefit of the increase in general shipping.

The tone of the market was weak, prices having dropped to a lower level than at any other time this year.

French Coal Market Satisfactory

The French coal market continues satisfactory. Demand for house and industrial coals is fair, with supply of the former below the requirements. Coal dealers in Paris report that their supply of British anthracite is scarcely sufficient to meet the demand, with comparatively little of Belgian and semi-bituminous coals on hand. Deliveries both of French and Belgian coals are slow. It is not expected that prices for French coals will change during October.

The rolling car crisis continues acute and the mines are lacking facilities for loading their daily output. Coal movement in the ports is slow.

During the first ten days of September the S. C. O. F. received 41,822 tons of coke from the Ruhr. Conferences are being arranged for between representatives of the French Government and the Commission for Reparations

looking to a revision of the mode of fixation of German requisitioned coke. Efforts will be made to readjust the prices to be paid for coke.

The Bankers Trust Co. of New York, has received from its French Information Service statistics showing that the production of the Sarre coal mines has been increased about 25 per cent under French administration. In 1919 these mines produced 8,758,356 metric tons and in 1922 this was increased to 10,943,311 tons, according to these statistics.

News Items From Field and Trade

ALABAMA

Convicts employed in the Banner Mines of the Pratt Consolidated Coal Co. staged a strike or riot Sept. 10 during which mining machines, pumps and other machinery in the workings were considerably damaged by being dynamited. The rioters held full sway in the mines for twenty-four hours, during which time production was completely stopped and the output was under normal for several days account of the damaged equipment. The rioting was instigated by white convicts recently sent to Banner from Aldrich Mines and was based on alleged dissatisfaction with the warden and physician, tasks imposed and other complaints. The mining officials have no jurisdiction over the convicts, being worked by the State Board of Supervisors, and are fed, clothed and worked under the complete control of the convict department.

The County Coal Co., with mines in the Cahaba Valley, near Birmingham, on the Central of Georgia Ry., is reported considering the opening of an additional slope and the construction of a washery. Clem Sussong, of Birmingham, is general manager, and William F. Sussong, Carnegie, Pa., president.

The Black Creek Coal Co. is reported to have sold one of its mines at Nauvoo, to the Monroe-Warrior Coal Co., which also will operate another mine of the Black Creek Co. under lease at the same point.

Truck No. 1 of the Birmingham Mine Rescue Station, is now making a tour of the mines and industrial works in the district, giving instructions in mine-rescue and first-aid work. James M. Cobb, foreman, is in charge of the work.

CONNECTICUT

The Norma Company of America has placed contracts for the erection of the first unit of its new plant at Stamford, on a 17-acre plot facing the main line tracks of the New York, New Haven & Hartford R.R., adjacent to Glenbrook Station. The new plant will be equipped to manufacture Hoffmann precision roller bearings, the American rights to which, as well as to all other Hoffmann products, were recently acquired from the Hoffmann Manufacturing Co., Ltd., of Chelmsford, Essex, England. The plant also will be equipped for the expansion of the manufacture of Norma precision ball bearings.

ILLINOIS

A state charter has been issued to the **Miner's Run Coal Co.**, of McIntyre. Its purpose is prospecting for and mining coal and the manufacture of coke. The incorporators are: Fred B. Smith, Blossburg, treasurer; W. Scott Jenkins, Blossburg, and William F. O'Donnell, Morris Run. Each of the incorporators holds 2,500 shares of stock, the par value of which is \$1.

G. Wenselmann, of the Wenzelmann Manufacturing Co., of Galesburg, is about to open a shaft mine on his farm along the Minneapolis & St. Louis Ry. The main office of the mine will be in Galesburg.

As another aftermath of the Herrin massacre the **Southern Illinois Coal Co.**, owners, at the time, of the Lester strip mine near Herrin, is asking for a change of venue for its damage suit for \$175,000 against the County of Williamson. The company says it cannot get a fair trial in that county. Delos C. Duty, state's attorney for the county, has filed an affidavit in reply, saying: "It is my honest belief that a majority of the coal miners or members of the United Mine Workers of America themselves were not and are not in sympathy with the things that were done in and during the so-called Herrin massacre, and the majority of the citizens of Williamson County are not prejudiced against the Southern Illinois Coal Co. to such an extent that it cannot have a fair and impartial trial."

The Atomizing and Reduction Co., of Herrin, recently suffered a loss by fire estimated at \$60,000. The plant has been in operation for about three years and is one of the largest coking plants in Southern Illinois.

Fire caused damage of over \$5,000 recently at the plant of the **Odin Coal Co.** at

Odin. The machinery and equipment of the mine suffered to a large extent and it will be some time before the mine can again be worked. Several hundred men were thrown out of work.

The St. Ellen mine, at O'Fallon, has resumed operations after being idle for over four months. The mine is one of the oldest in the Belleville district and employs 400 men when working with a full crew.

No. 8 mine of the **Madison Coal Corp.**, near Carterville, will be closed down and abandoned in the next few months. The mine is a pioneer in the coal industry of southern Illinois and was operated back in the 90's by Sam T. Brush, of Carbondale, who died over a year ago. During the operation at that time a strike was called by the newly organized union men and Brush hired negro labor and private mine guards and operated the mine. Since that time the shaft has been known as the "Brush riot mine" at Carterville. The company will dismantle and remove all machinery and equipment of value.

The Jefferson Southwestern R.R., 11 miles long, was opened for traffic Sept. 15 when trains from Mt. Vernon were run to Nason, Jefferson County, a new field north of Franklin County, where the two shafts of the Illinois Coal Corp. are down about 500 ft. The coal is approximately 700 ft. deep under the property.

The mine of the Valley View Coal Co. at Coal Valley has started operations again. The mine had been idle practically the entire summer and is now working a full crew of men.

The Chicago Coal Merchants' Association reports the receipt of more voluntary applications for membership during the past few weeks than at any previous like period in its history, as a result of its recent activities among the retail coal dealers of the city. New members in the association as well as old ones, are receiving new membership certificates of handsome design, engrossed and bearing a gold seal.

The extensions at Mine No. 4 of Donk Brothers Coal & Coke Co. which have been in progress for several months to complete the mine as originally proposed are about completed. The mine has been running three days a week, hoisting 2,000 tons daily through the airshaft. The output will be increased to 3,500 tons as soon as the main shaft is finished and gradually increased as the mine is developed.

J. C. Core, with new offices in the Continental & Commercial Bank Building, Chicago, has been appointed sales agent for the St. Louis Coal & Iron Co., with Chicago and vicinity as his territory.

Fred Trubger, formerly mining engineer with the Southern Gem Coal Corporation, with headquarters in Pinckneyville, is now working as assistant to chief engineer White of the Union Colliery Co., at Dowell.

W. G. Hughes Coal Co., Chicago, has been incorporated with a capital of \$30,000 to deal in coal mines; incorporators, C. I. Abbat, W. G. Hughes and K. R. Leva.

Plans are being considered for erecting a "coal palace" at the state fair. The "palace" would be erected in order to advertise the huge coal resources of Carbon County, which has one of the largest deposits of bituminous coal in the world.

Incorporation papers have been filed at Springfield for the **Chicago Williamson Coal Co.** The capital stock is \$10,000. The company will engage in buying, selling and mining coal and other fuel. W. M. Stephenson, J. S. Bash and William J. Bash are the incorporators.

The Pigeon Creek Coal Co. has removed its general offices from Chicago to Booneville, Ind. W. R. Bootz has been elected secretary-treasurer of the company. He succeeds W. F. O'Shea who resigned recently.

Bertram E. Safford, formerly assistant to Charles R. Campbell, sales manager for the John A. Logan Coal Co., has been appointed manager of the Phoenix Coal Co. with headquarters in the Plymouth building, Chicago. The latter company is owned by Pratt Brothers, of Minneapolis.

The mine of the Pratt Bros. Coal Co., near Herrin, commonly called the Jeffrey Mine, during the month of July hoisted more than 52,000 tons, a record for the shaft. The mine employs approximately 500 men. Other mines in the same district are working from one to three days per week and some not at all.

The O'Gara Coal Co. has prepared a 250-ft. motion picture film for display to the public through the agency of the retailer. The picture follows the mining process through the various steps of under-cutting, loading, mule haulage to the main line, motor haulage to the bottom and hoisting. Preparation is then shown over the screens, the picking tables and loading booms and into the railroad cars.

INDIANA

Bronze medals have been received by the Terre Haute Humane Society for the two men who several weeks ago saved the life of the pony, Rex, which had been confined in a mine cave-in at Bicknell for ten days. Hope of saving the pony was abandoned by the rescue crew because it would be necessary to enlarge the hole through which the men escaped. Corn and oats had been supplied to the pony through the same pipe through which the entombed men received their food while in the mine. The larger medals are to be awarded to William Thurston and John Cottrell, two of the rescued miners, who, on learning that the rescue crew had given up hope of saving the pony, set about to rescue it and succeeded. Smaller medals, given by the American Society for the Prevention of Cruelty to Animals, were received for Ralph Manson, Peter Brown, Edward Reister, Lon Crawford and William Bailey, who assisted in the work.

The Modern Fourth Vein Coal Co. has been incorporated with a capital of \$350,000 to mine and deal in coal at Jasonville. The directors of the company are John Williams, T. G. Williams, C. W. Wenner, W. C. Clifford, F. W. Adams, O. H. Finnical and F. B. Grove.

KENTUCKY

B. Blenkinsopp, State Mine Inspector, in a recent report, stated that 30 per cent of the state mines were down. The semi-annual report, issued Aug. 7, showed that during the first six months of 1923 a total of 18,424,599 tons of coal was produced, as compared with 17,267,132 tons last year in the same period. Harlan County, or District No. 5, led with 3,888,472 tons, with 83 mines in operation, employing 8,131 men. District No. 6, comprising Lecher, Knott and Perry counties, produced 3,204,656 tons in 127 mines. Eight thousand more men are employed this season than last at the same time, there being 56,447 men employed, as against 48,000 last year. The report states that 69 mines have been abandoned or shut down temporarily this year, and the average number of days worked is 54 as compared with 69 for the first six months of 1922.

The Democratic party in Kentucky on Saturday, Sept. 8, nominated William Jason Fields, of Mt. Olivet, Carter County, to run for Governor, to succeed J. Campbell Cantrill, who died after receiving the nomination. The new nominee has been in Congress for 10 years as Representative from the Ninth district of Kentucky. It is understood that he will carry out the late Mr. Cantrill's platform, which was not antagonistic to the coal interests of the state. Charles I. Dawson, Republican nominee, also is favorable to the coal interests. Considerable interest is manifested by coal men in the nominations, as it is well understood that a hard fight will be made before the next Kentucky Legislature, early in 1924, to place a production tax on all coal mined in the state.

The Pacific Coal Co., Louisville, capital \$20,000, has been incorporated by C. D. Glass, Walter S. Lapp and J. E. Miller. Mr. Glass has been well known in the Louisville and western Kentucky districts as a coal man for years.

W. M. Jones, of Huntington, W. Va., H. B. Jones and W. S. Hamilton, Louisville, represent a syndicate that has recently bought the **Kentucky, Rockcastle & Cumberland R.R.**, running from Heidelberg, Ky., about 28 miles through Lee, Jackson and Owsley counties of eastern Kentucky. The road was originally built to reach 27,000 acres of timberland of the Turkey Foot Lumber Co. It will be extended a quarter of a mile to the Kentucky River, where loading docks will be installed so that transfer can be made to barges for movement to Louisville and Cincinnati, and a large rail and water coal movement will be developed.

The Rockport Coal Co. of Rockport, is planning to shut down soon to install additional screens and loading booms, and while down will install concrete foundations for a crushing plant.

The Turner Elkhorn Coal Co., of Lexington, capital \$100,000, has been chartered by Joseph S. Claybrooke, John I. Claybrooke and James R. Claybrooke.

The Dawson Daylight Coal Co., of Louisville, headed by K. U. Meguire, of the Harlan Coal Co., is planning a fine operation near Dawson Springs, which will have a modern five-track tippie rated at 300 tons an hour. Contract has been let for the tippie which has been designed and will be equipped by the Morrow Manufacturing Co., of Wellston, Ohio, and with its five-track arrangement will be able to produce all the sizes now made in Franklin County, Illinois. It will be equipped with a complete washery, picking tables, two loading booms, a crushing outfit, etc.

A gift of \$1,000 to the student loan fund of the University of Kentucky has been made by the West Kentucky Coal Co., of which C. F. Richardson is president.

The Kentucky State Federation of Labor at a meeting in Frankfort last week adopted resolutions in an effort to aid the union miner, these resolutions calling on all union men to demand union-mined coal and use their influence in developing a consumption of union mined coal only.

The See See Coal Co., of Pineville, capital \$75,000, has been incorporated by R. I. Cawthorne, Lottie E. Cawthorne and E. R. Martin.

With a capital of \$100,000, the North Star Coal Co., Madisonville, has been incorporated by L. C. Oliver, E. A. Oliver and L. P. Sisk.

The Westchester Coal Co., Island, capital \$125,000, has been incorporated by I. G. Reynier, Abraham Shapiro, and Lerbert L. Spitzer.

MARYLAND

Because of the unsettled labor conditions in the Gorge's Creek region, Abell Wolman, chief engineer of the State Health Department, has withdrawn his engineering force temporarily from the study of the sanitation problems. The Health Department's mission in this region for the last nine months has been to create sentiment for the support of a district water and sewerage system which would serve the entire area. The representatives of Mr. Wolman's department had held several meetings in the district and had gained considerable support before the labor situation became acute.

MINNESOTA

A series of recommendations has been made by a committee in Minneapolis of the American Federated Engineering Societies, relating to the coal problem and how to solve it. The committee sees in coal storage and summer movement, a big relief to the present difficulties of car shortage and congested demand. The committee sees the need of financing aid which could be done through a financing agency, warehousing committee or the municipality itself.

MISSOURI

Ernest R. Sweeney, member Gray-Bryan-Sweeney Coal Co. of Kansas City, is still missing. He disappeared Aug. 30. Hope for his return has virtually been abandoned by friends and relatives, although no effort has been made to close his estate. Ben R. Sweeney, a son of the missing man, has posted a \$500 reward for authentic information as to Sweeney's whereabouts or the recovery of the body.

Drillers testing for oil south of Chilli-cothe on Sept. 21 passed through a fourth stratum of coal, making a total of 22 ft. passed through in the last 170 ft. of drilling. The various depths are: at 360 ft. a 6-ft. vein; at 378 ft. a 3-ft. vein, both of fine grade bituminous; at 443 ft. a 7-ft. vein of semi-anthracite and at 524 ft. a 6-ft. vein of semi-anthracite. Geological surveys indicate the coal area in this field extends over 4,000 acres two miles in length. Recently a fine grade of rock asphalt was found in that section.

A state charter has been issued to the Jenkins Fuel Co., Plainsville, with a capital stock of \$8,000. The purpose of the company is to mine, wash and prepare anthracite. The incorporators are John E. Monahan, treasurer; Michael J. Piernock and Stephen G. Piernock, all of Plainsville.

The Big River Coal Co., St. Louis, has been incorporated under the laws of Missouri for \$6,000. The incorporators are A. B. Jefferis, L. M. Jefferis and J. R. Van

Slyke. The company will produce, prepare, buy and sell coal.

The Pennsylvania Smokeless Coal Mining Co., Ebensburg, has been incorporated at Harrisburg. This company has a capital stock of \$150,000 and its purpose is to mine, sell and ship coal. The incorporators are E. M. Burns, William M. Smith and Philip N. Shettig, all of Ebensburg, and Walter D. Brown, Ebensburg, is treasurer.

NEBRASKA

Governor C. W. Bryan of Nebraska, who announced on Sept. 13 that he had gone into the coal business not only for his own but any other state, declared that with the help of the people they can save \$15,000,000 in Nebraska alone, which the "coal combine" has been heretofore taking out of the state. He further announced that he would do all possible to break "the national combine." The Governor declared that while it was the duty of the federal administration to take a hand in lowering coal prices, it was not doing so, and that the State of Nebraska would take the matter in hand, so far as that state is concerned, ultimately extending any aid to other states if requested. The Governor is buying coal at the mine at \$3 a ton, and he had announced previously that it will be sold at this price, which includes 25c. margin for freight rates and handling.

NEW YORK

Through a certificate filed in the office of the Secretary of State at Albany by Wellman, Smyth and Scofield, New York City, the name of the O'Brien-Cuttle Coal Corporation of Manhattan Borough has been changed to the O'Brien Coal Corporation.

The following important changes in the branch offices of the Maher Collieries Co., of Cleveland, have been given out: F. B. Shondell, salesman at Buffalo, has gone to Toledo to open an office for the company; O. E. Southard remains manager of the Buffalo office; David Price, traveling agent, is establishing an office for the company in Cincinnati; Ross C. Wheatly, formerly soliciting agent of the Toronto, Hamilton & Buffalo Ry., will open an office for the Maher company in Hamilton. The company produces upward of 150 cars of bituminous coal a day.

G. N. Wilson, president of the Lehigh Valley Coal Sales Co., New York City, returned Sept. 21 from a month's vacation in Europe.

The Coal Hill Mining Co. of Pennsylvania, has filed a duplicate certificate of incorporation in the office of the Secretary of State and will enter New York State with its principal office at Binghamton. The corporation will deal in coal and coke.

Mortimer E. Cooley, president of the Executive Board of the American Engineering Council of the Federated American Engineering Societies, has announced that the coal problem will be among the subjects discussed at a meeting of engineers to be held at Rochester, Oct. 12 and 13. Of chief interest will be a report of the Federation's committee on coal storage, which has been conducting a study in co-operation with 107 local committees all over the country.

OHIO

A new issue of \$1,275,000 first mortgage 6 1/2 per cent gold bonds of the Maher Collieries Co. is being made. The bonds are dated Aug. 1, 1923, and mature in equal annual instalments of \$85,000 on Aug. 1, 1924, to 1938, inclusive. The 1924 and 1925 maturities are offered on a basis to yield about 6 1/2 per cent, and 1926 to 1938, inclusive, on about a 7 per cent basis. The properties of the Maher Collieries Co. are situated in Belmont County, and consist of about 7,000 acres of coal lands. The property has six mines. The proceeds of the sale of the bonds will be used to retire current indebtedness, for additional working capital for the development of the property and that of the subsidiary, the Marcoll Coal Co.

The Supreme Coal & Coke Co., of Cleveland, has been chartered with an authorized capital of \$10,000 to mine and sell coal and to deal in coke. Incorporators are Donald Kennedy, Ellen F. Kennedy, Thomas M. Kennedy, Jr., B. J. Cummings and T. M. Kennedy.

A fire in the large storage pile of the Philadelphia & Cleveland Coal Co. at Groveport, is causing some concern among officials of that company. The fire developed several weeks ago and is not yet under control. The pile consists of about 100,000 tons of screenings which is near the power plant of the Columbus Railway, Power & Light Co. The company has stopped the purchase of slack temporarily as a result of the fire.

PENNSYLVANIA

The Philadelphia & Reading Coal & Iron Co. is planning the erection of a new anthracite washery near Shamokin.

The Pennsylvania Coal Co. has purchased between 250 and 300 vacant lots in the Green Ridge section of Scranton. Underlying the surface are vast deposits of anthracite, which the company is understood to have plans for mining after the top veins have been exposed by stripping operations.

Work has been resumed at the Audenreid Mines of the Lehigh & Wilkes-Barre Coal Co., where the men had been on strike for more than a week, due to a dispute over the split plan proposed by the company. The order to return to work was issued Sept. 28 after a meeting of the local union. The return is at the direction of the board of conciliation, which ruled that in all cases where there have been suspensions owing to disputes over contract terms the men should return and have their cases adjusted by that body. About 1,800 men were affected.

The Jordan Valley Coal Co. started active operation with fully equipped heavy steam machinery Sunday, Sept. 2. A basket picnic was held on the property between Arlington and Granite Falls.

Members of the Scranton School Board have voted to purchase from the Se-Rob Coal Co. the coal under No. 19 school for \$7,333.75. Recently the company offered to sell its right to the coal to the school district for \$9,872.85. As a result of conferences with the owners this figure was reduced \$2,530.10.

It is said that negotiations are under way for the purchase of the Manown and Gallatin mines, located on the Pittsburgh & Lake Erie R.R. in Allegheny County, following an inspection of the property by J. H. Laughlin, an agent for the Independent Coal & Coke Co., of Pittsburgh. Both mines operate tipples on the Monongahela River.

The first wage scale in central Pennsylvania for men running underground loading machines became effective recently. Machine operators are getting \$7.60 a day and helpers \$7.50. This scale was worked out primarily for two Myers-Whaley machines now doing entry loading for Peale, Peacock & Kerr in the Ellsworth-Dunham Coal Co. mine at Arcadia.

Michael Delopvich, a miner, was paroled by Judge Fuller at Wilkes-Barre after being sentenced to serve one year in jail on an assault and battery charge. He told the judge that he was a good miner and was anxious to go to work as he had been idle for a long time. The judge released him on the condition that in case another strike was called that he report to court prepared to go to jail and serve sentence until work was resumed. The miner was glad to make the promise and walked out of the court house in a happy frame of mind.

Another effort, it is announced, will be started soon to extinguish the burning coal mines at Summit Hill and save the veins not already destroyed by the fire which has raged there for more than 65 years. The Drake Drilling Co. plans to sink 10-in. holes into the burning mines through which culm will be flushed. This will at least cut off air channels through which the fire might reach the Nesquehoning workings, as the flames have recently broken out anew between the Summit Hill No. 6 colliery and the Nesquehoning.

TENNESSEE

An application for an amendment to the charter of incorporation of the Kelley's Ferry Coal Co., increasing the capitalization from \$20,000 to \$25,000, has been filed in the County Court clerk's office at Chattanooga. The incorporators are A. W. Kelley, W. J. Nixon, F. L. Martin, G. W. Nixon and W. H. Pryor.

It has been announced that Pittsburgh capitalists have purchased 10,000 acres of virgin coal lands from the Wedensia Coal Co., west of Rockwood, and that options have been acquired on about 50,000 acres of coal properties owned by the East Tennessee Iron & Coal Co., and located in Campbell County. These options have several months to run before date of expiration. In the meantime abstracts of titles are being made, and other investigations are under way. Developments indicate that the options will be closed, and that not less than \$2,000,000 will be expended on the Campbell County tract alone.

It is also understood that about \$1,000,000

is involved in the purchase and proposed development of the coal lands near Rockwood. The plans for this are understood to be formulating, and work of construction on some of the new industries may begin at an early date.

TEXAS

W. C. Dodd, of Malakoff, has acquired the Crockett lignite mine, near Como, and will develop it.

VIRGINIA

D. M. Thornton, president of the Norfolk-Portsmouth Freight Traffic Commission, has resigned, and his successor has not been named.

Ellis Searles, of Washington, editor of the *United Mine Workers' Journal*, addressing the Norfolk Monday Club, declared the miner wants better wages, better living conditions, and to become a better American citizen. He declared government interference prolongs the settlement of differences between miner and operator, with consequent maladjustment of the coal situation.

WASHINGTON

Halbom & Stridell, of Kelso, are developing a coal mine on the Bingham place, southwest of Castle Rock, where a vein of excellent coal has been uncovered.

WEST VIRGINIA

The report of the State Department of Mines covering the fiscal year ending June 30, 1922, which has just come from the press, shows that the **total coal production in West Virginia for the period covered was 70,888,208 gross tons**, a decrease of 9,873,203 gross tons, or 12.23 per cent, as compared with production during the previous year. The total value of coal produced in the fiscal year ending June 30, 1922, was \$180,764,917.65. The value of all coke sold was \$1,026,414.16. Only 175,156 net tons of coke was manufactured in West Virginia during the period ending June 30, that representing a decrease of 661,572 net tons, or 79.06 per cent.

Coal concerns recently dissolved and the charters of which have been surrendered are as follows: **W. E. Griffiths Coal Co.**, **Sullivan Coal & Coke Co.**, **Pigeon Creek Mining Co.**, **Hess Coal & Coke Co.**, **Beckley Fire Creek Coal Co.**, **Maryland Coal Mining Co.**, **Big Vein Pocahontas Co.**, dissolved by decree of bankruptcy filed with Secretary of State.

W. J. Quinn has withdrawn from the Merrimac Fuel Company, of which he was vice-president, and will form other connections at Huntington.

An action has been instituted in the Circuit Court of Kanawha County by the **Holden Collieries Co. against the Boone County Coal Corporation** for the recovery of \$6,745.61 which the plaintiff claims is the difference between the contract rate for power the defendant agreed to furnish and the rate allowed by the Public Service Commission.

Pending repairs and improvements **No. 1 mine of the Rosedale Coal Co.**, in the Monongalia County field, has been shut down and during such suspension contracts for output will be handled from the No. 2 plant of the company, which has just resumed operations after having been shut down for repairs. It is desired to make changes in the power system and to move the motor generator plant to a new location.

Water from the bed of Decker's Creek broke through a heading and **flooded the Bretz mine of the Bethlehem Mines Corporation** at Bretz, near Masontown, late in September, causing damage estimated at \$100,000.

The **New River Company**, one of the heaviest producers in the New River field, in which New England capitalists are largely interested, have begun the publication of the *New River Company Employees' Magazine*, devoted to the interest of employees. This magazine is published at Macdonald, general headquarters of the company in West Virginia, the first issue appearing late in September. The company has adopted the policy of inserting "suggestion" sheets in each copy so that employees may be in a position to make safety-first suggestions.

That three miners were killed Sept. 24 in an explosion at the Bentwood Mine of the Wheeling Steel & Iron Co., at Wheeling,

became known when the bodies of **Joseph Birrello**, **Michael Corda** and **J. J. Carskaden**, the latter a fireboss, were found buried beneath tons of coal and stone.

The report of the State Tax Commissioner covering the operation of the gross sales tax in West Virginia for the fiscal year ending June 30, 1923, shows that of a total of \$2,938,932.90 collected in the fiscal year the coal industry paid \$1,219,724.11, or 41.50 per cent of the total collected. In the year ending June 30, 1922, the first year the gross sales tax was in effect, the coal industry paid a total of \$681,196.32, or 34.94 per cent.

Having recently purchased the holdings and plant of the Rivesville Coal Co., in the Marion County field, the **Edward Hines interests, of Chicago**, are now engaged in perfecting plans to install up-to-date machinery that will make it possible to increase the capacity of the plant from 600 to 2,000 tons per day. Increased trackage and siding room will be provided, the Baltimore & Ohio having agreed to install additional crossovers. The Hines interests control practically 1,000 acres of Sewickley coal in the vicinity of the Rivesville plant, much of which they bought at the time the purchase of the mining plant of the Rivesville Coal Co. was consummated.

The **J. D. Boone Coal Co.** recently began operation near Kanawha Falls in the New River field, but the principal office of the company will be at Fayetteville, in Fayette County, where offices are being fitted up for **James D. Boone**, superintendent of the company and other officers.

A mine fire at fan plant No. 35 of the Consolidation Coal Co., on the West Fork River near Watson, threatened to do a good deal of damage late in September, but was extinguished within a period of 24 hours through the prompt and efficient work of fire-fighting forces under the direction of **C. H. Tarleton**, manager of the West Virginia Division of the company, and **Frank Haas**, consulting engineer.

WISCONSIN

Governor John J. Blaine of Wisconsin has directed the division of markets of the state to make a searching inquiry into coal prices and profits, and methods of coal marketing. The inquiry will be particularly directed towards a marked difference in anthracite prices in favor of the Duluth market as against Lake Michigan ports, more particularly Milwaukee, which is a large coal-receiving port with excellent harbor and superior coal handling facilities. It is held that Milwaukee is being charged on the basis of the all-rail haul, when the much cheaper lake-and-rail rate should apply.

The **Smith Wrecking & Salvaging Co.**, of Milwaukee, is engaged in recovering about 3,000 tons of anthracite from the wreck of the steamer **Frank O'Conner**, which burned and sunk off Cana Island, Lake Michigan, several years ago. The coal lies in 60 ft. of water.

WASHINGTON, D. C.

The railroad relations committee of the **National Coal Association** for the coming year is as follows: **W. L. Andrews**, vice-president, Consolidated Coal Co., Baltimore; **D. H. Barger**, president, Smokeless Coal & Coke Co., Shawsville, Va.; **C. D. Boyd**, traffic manager, Hazard, Harlan and Southern Appalachian Coal Operators' Association, Louisville; **J. S. Brennan**, secretary, Somerset County Operators' Association, Somerset, Pa.; **A. W. Calloway**, president, Davis Coal & Coke Co., Philadelphia; **George H. Francis**, secretary, Keystone Coal & Coke Company, Greensburg, Pa.; **C. S. Garland**, superintendent of transportation, Hillman Coal & Coke Co., Pittsburgh; **C. J. Goodyear**, acting commissioner, Pittsburgh Coal Producers' Association, Pittsburgh; **S. C. Higgins**, secretary, New River Coal Operators' Association, Mt. Hope, W. Va.; **D. F. Hurd**, secretary, Pittsburgh Vein Operators' Association of Ohio, Cleveland; **S. Pemberton Hutchinson**, president, Westmoreland Coal Co., Philadelphia; **C. H. Jenkins** (chairman), vice-president, Hutchinson Coal Co., Fairmont, W. Va.; **John S. Jones**, president, Sunday Creek Coal Co., Columbus, Ohio; **E. C. Mahan**, president, Southern Coal & Coke Co., Knoxville, Tenn.; **W. J. Manley**, traffic manager, Logan Coal Operators' Association, Logan, W. Va.; **F. M. Manson**, traffic manager, W. J. Rainey, Inc., New York; **J. B. Pauley**, vice-president, J. K. Dering Coal Co., Chicago; **C. F. Richardson**, president, West Kentucky Coal Co., Sturgis, Ky.; **F. A. Sweet**, president, Stand-

ard Coal Co., Salt Lake City, Utah; **Jonas Waffle**, secretary, Indiana Coal Traffic Bureau, Terre Haute; **C. E. Warner**, traffic manager, Southwestern Interstate Coal Operators' Association, Kansas City, Mo.; **A. R. Yarborough**, traffic manager, Kanawha Coal Operators' Association, Charleston, W. Va.; **S. L. Yerkes**, vice-president, Grider Coal Sales Agency, Birmingham, Ala.

CANADA

The coal production of **British Columbia** during August totaled 222,296 tons, an increase over July output of 9,489 tons, an over June of 36,136 tons. May production was 59,984 tons lower than that of August. Mines on Vancouver Island produced 135,947 tons in August, a little over 61 per cent and 3,316 tons more than July. The Nicola Princeton mines produced 21,591 tons, an increase of 4,870 tons and nearly 10 per cent of the total production. The Crow's Nest Pass district produced 64,758 tons, an increase of 1,303 tons and approximately 29 per cent of the total for the Province.

Engineers and construction men of the **Dominion Coal Co.** are bending every effort to hasten to completion the huge steel bankhead which is in course of erection on the tableland known as O'Neill's Point jutting out seaward near Bridgeport. The shaft of the new mine, known officially as Dominion No. 1B, was completed some weeks ago. The company also is sinking another shaft at Lingan.

The strike of about 1,000 coal miners at Drumheller, Alta, which began Aug. 30, is over. The men returned to work Sept. 18 in accordance with the order of the district officials of the union, who declared the strike unauthorized. The trouble arose over the attempted introduction by the miners of the O. K. list system, under which all men taken on by the operators must be O. K'd. by the union before going to work. An investigation as to alleged discrimination against men will be held.

An effort by Attorney General Nickle of Ontario to induce the Canadian National Railways to increase the 10,000-ton maximum of coal shipments from Alberta under the \$7 freight rate has proved unavailing. Sir Henry Thornton definitely stated that the 10,000-ton allotment would be the limit and that the \$7 rate would cease at midnight Oct. 31.

R. M. Young, commissioner of the Western Canada Coal Operators' Association, states that information has been received to the effect that promoters were endeavoring to establish coal companies in Ontario for the importation of Alberta coal, stating that by purchasing stock, subscribers could have coal laid down in Ontario at \$11 per ton. It is not necessary, said Mr. Young, for anyone to take shares in a company to obtain Alberta coal, as the operating mines are fully adequate to provide tonnage for any market that may open in Ontario, and he did not know of any place in Alberta where coal could be produced and sold f.o.b. cars at \$2, which is what a laid-down price of \$11 at Ontario points would mean.

D. H. McDougall has resigned his position as vice-president of the British Empire Steel Corporation after having been for 20 years associated with the constituent companies of that organization, his contract with the Nova Scotia Steel & Coal Co., of which he was formerly president, having expired.

In pursuance of the policy of putting coke on the market as a substitute for American anthracite for domestic use the **British Empire Steel Corporation** has appointed **Frank Lucas** head of the department for the sale of coke. Mr. Lucas has had wide experience and is an expert in the work of analyzing coal and coke.

Available statistics show that during the month of August the Sydney Mines collieries produced 84,900 tons of coal, the biggest output in the history of the Scotia pits. The near-approach to this figure was made in November, 1909, when 81,000 tons were hoisted to the surface. The 99,000 mark might have been exceeded had there not been delays in shipping, etc. This is a noteworthy performance in view of the fact that the areas at Sydney Mines are submarine, and are also the oldest mine workings in the Dominion of Canada.

A ruling of the Department of Excise and Customs at Ottawa, just issued, declares that in the matter of lignite and lignite coal dust, which are now admitted into Canada duty free, such coals are now to be defined as having not less than 6 per cent moisture content on the air-dried basis. Lignite coal, it is declared, includes all grades lower than true bituminous.

Obituary

Edmund Cobb Morgan, a noted inventor of coal-mining machinery, died suddenly July 13, 1923, of heart failure at his home on Riverside Drive, in New York city. Mr. Morgan was born in Ashkum, Ill., in 1867. When about 21 years of age he obtained a position with Elmer A. Sperry, assisting in the development of an Electric pick-mining machine. This work inspired him to make an improvement of his own on a pick machine. Mr. Morgan started as a pioneer in the electric mining-machine field and was responsible for the development of the first Morgan-Gardner mining machines. Later he developed an electric mine-haulage system and built a large factory in East Chicago. Later he formed the American-Morgan Co. for the purpose of building coal-mining and loading machines. During the last fourteen years of his life Mr. Morgan's time was devoted almost exclusively to the development of coal-mining machinery, particularly the combined coal-mining and loading machine. He had several applications for patents on coal-mining machines and systems in course of preparation at the time of his death. He is survived by his wife, a daughter, two sisters and a brother.

Frank E. McChesney, one time coal dealer in Troy, died suddenly at his home Sept. 19. Mr. McChesney was born in Brunswick, Rensselaer County, and came to Troy when a young man and became associated with the John Worthington Coal Co. He later purchased this business and conducted it for five years, sold out to Craver, Cowee & Baxter and entered the firm of the Great Eastern Storage & Warehouse Co., being treasurer of the company for a number of years. For the last few years he had been connected with the teaming and trucking business of Samuel E. Jordan, Troy.

T. H. Friel, a pioneer in the development of coal mining in the Birmingham district, died from an attack of heart trouble Sept. 13. Mr. Friel was widely known and at the time of his death was operating a mine in the Blue Creek district. He was 62 years of age and was serving as Mayor of North Birmingham at the time of its absorption by the greater city.

John L. Mitchell, former Cambria County (Pa.) coal operator and at one time owner of the Pennsylvania Coal & Coke Co. operations in Cambria County, died in a Chicago hospital recently. His home was at Royalton, Ill., where he had been connected with extensive coal operations, being one of the leading operators in the Middle West. He was 74 years old.

Washer for Classifying Coal, etc. Lucien Malecot, Grand Croix, France; 1,462,418. July 17, 1923. Filed March 8, 1922; serial No. 542,069.

Coking of Coal. Stewart Roy Illingworth, Brynffedwen, England, assignor to Illingworth Carbonization Co., Manchester, England; 1,426,576. July 24, 1923. Filed Aug. 29, 1921; serial No. 496,743.

Spiral Separator. Frank Pardee, Hazleton, Pa., assignor to the Anthracite Separator Co., Hazleton, Pa.; 1,462,618. July 24, 1923. Filed Oct. 10, 1921; serial No. 506,755.

Mining-Machine Bit. Newton K. Bowman, Bowdli, Ohio; 1,462,681. July 24, 1923. Filed Dec. 15, 1921; serial No. 522,578.

Clamshell Bucket Operating Mechanism. Samuel O. Nafziger, Goshen, Ind.; 1,463,090. July 24, 1923. Filed Oct. 7, 1920; serial No. 415,248.

Association Activities

At a recent meeting of the St. Louis Coal Club two new members were admitted to membership and the following committees appointed for the ensuing year: Finance, Stanley Clark, F. W. Howell, H. G. Trier; sick, C. M. Snow, J. J. Connell, C. V. Beck; legislative, E. J. Wallace, Hubert Hoffner, F. L. Keightley; membership, A. W. Loomis, John Dearness, W. E. Bridges; entertainment, J. A. Jeffries, A. H. Beddoe and Homer McDonald.

Smokeless operators of southern West Virginia held their first meeting since June in Washington a few days ago. There was a large attendance, all the smokeless fields being well represented. In view of possible

changes in rates from Pittsburgh territory, transportation matters were considered of paramount importance. The belief was expressed that if rates should be rearranged from Pittsburgh territory, as requested by Pittsburgh operators, it would have the effect of zoning smokeless coal out of many of the Western markets and steps were taken to combat the move. The association elected a special committee consisting of G. H. Caperton, of Charleston, chairman; O. M. Deyerle, of Bluefield; P. M. Snyder, of Mt. Hope, and Justus Collins, of Charleston, to draft appropriate resolutions in connection with the death of Charles C. Beury, of Charleston, one of the founders of the organization.

Publications Received

Foundry Work. By R. E. Wendt, head instructor in foundry practice, Purdue University. Pp. 206; 5x7½ in.; illus. Price, \$2. In three parts. Part I covers fundamental principles of foundry work, the sizes and types of blast furnaces and the making of pig iron; part II provides instruction for practice in moulding, core-making and other parts of foundry work; part III describes the mixing and melting of metals. Published by the McGraw-Hill Book Co., Inc., 370 Seventh Ave., New York City.

Mechanics of Machinery—Part I. By Robert C. H. Heck, professor of mechanical engineering, Rutgers College. Pp. 508; 6x9 in.; illus. Price \$5. The first part of a two-volume treatise covering the whole field of motions and forces in machines. Published by the McGraw-Hill Book Co., Inc., 370 Seventh Ave., New York City.

Explosives. Census of Manufactures, 1921. Bureau of the Census, Washington, D. C. Pp. 10; 6x9 in.; tables. This report covers those concerns engaged primarily in the manufacture of explosives; it does not include those specializing in cartridges, detonators, fuses, etc.

Twenty-eighth Annual Report of the Mineral Resources of Tennessee. Department of Labor, Division of Mines, Nashville, Tenn. Pp. 135; 6x9 in.; illus.

The Department of Forests and Waters at Harrisburg, Pa., announces that a 28-page bulletin of the Coal Beds of Northern Somerset County, Pa., prepared by James D. Sisler of the State Geological Survey, is now ready for free distribution. The bulletin contains 36 analyses of various beds in different districts. The coal is valued highly for generating steam and for domestic fuel.

Traffic News

Milwaukee coal dock companies are jubilant over the decision of the Interstate Commerce Commission, upholding the system of group railroad rates established by the Wisconsin Railroad Commission. The report, which holds that the rates for intrastate transportation of soft coal from Lake Michigan docks are not prejudicial to Illinois mine operators, which has met the approval of the Commission's examiner, must yet be formally adopted by the entire Commission, but this usually is only a formality. Milwaukee dock men hold that if the plea of the Illinois coal men had prevailed, distribution from Milwaukee coal docks would have been cut down fully 50 per cent. At present Milwaukee distributes from 3,500,000 to 4,000,000 tons of coal a year. Not only does the decision protect Milwaukee's prestige as a coal distributing center but in the opinion of a leading dock man it saves soft-coal consumers about \$100,000 annually by giving them the benefit of competition between Illinois coal fields and lake distributing points.

A decision reached by several coal-carrying roads and made public at Chicago Sept. 24 to treat as empties all unbilled coal cars at mines in the daily allocation of cars may force many coal mines in Illinois, Indiana and western Kentucky to close. A slight car shortage in some of the producing fields and an accumulation of "no bills" at the mines were given as the cause. Most of the operators have sizes under lump in cars at the mines which cannot be moved because of a lack of orders. Heretofore, railroads have permitted producers to hold coal for billing without counting the cars on track against the shippers in furnishing cars for the daily run.

Reduced local coal freight rates on the three railroads entering Charleston became effective on Sept. 17. The reductions range from a high rate of \$1.26 to a minimum of

88c. from the plants in the various regions adjacent to Charleston to the industrial plants in the Charleston industrial district. S. P. Puffer, secretary of the Chamber of Commerce of Charleston, estimates that Charleston industries will be able to effect a saving of \$60,000 a year as a result of the reduction.

In an effort to avoid ordering a surplus number of cars for assignment to mines, mine owners in the Kanawha field have been asked by the Kanawha Operators' Association to order only such equipment as can be loaded out promptly; to give sufficient time to the car-distribution department where any certain class of equipment is required, to enable the car distribution department to assemble such equipment; to load all foreign cars placed at the mine in accordance with car-service rules; to advise the local car distributor on such days as mines order and are supplied more equipment than they are in a position to load so that the excess number of cars may be redistributed to mines in a position to load them on the same date. These instructions are in accordance with the policy of co-operation pledged at a meeting held on Aug. 16 at Huntington between the operators, representatives of the American Railway Association and officials of the Chesapeake & Ohio when it was agreed by representatives of four associations served by the C. & O. that they would co-operate with that line to the fullest extent in seeing that foreign-line equipment was loaded in the direction of the home line or if destined beyond that the home line could participate in the haul. As a means of reducing the number of empty cars left over daily at the mines the C. & O. has arranged to have continuous service in effect in the office of car distributors at Thurmond, Handley, St. Albans, Logan and Ashland.

Questions involved in the traffic case of the Larsen Coal Co. and the Domestic Coal Co. against the Michigan Central Ry. Co. and the Big Four Ry. Co. will be considered at an Interstate Commerce Commission hearing, to be held at Indianapolis, October 25. Examiner Carter will preside.

The North Carolina Corporation Commission is opposed to leasing the Carolina, Clinchfield & Ohio R.R. to the Atlantic Coast and the Louisville & Nashville or the Seaboard Air Line, believing that it should be made part of a "comprehensive system of railroads" serving the state.

A new railroad to be built in Monongalia County, West Virginia, by the Edward Hines interests, of Chicago, will make it possible to develop between 10,000 and 12,000 acres of Sewickley and Pittsburgh coal in the Indian Creek section of the county. The new line is to be about three miles in length and will form a connection with the Arnettsville terminal of the Indian Creek & North-ern R.R.

Provision is to be made by the Chesapeake & Ohio for the better handling of traffic and particularly coal traffic through Ashland, Ky., by the expenditure in all of about \$2,250,000 in that city for various improvements. It is proposed to spend a part of that sum for additional terminals through which it will be possible to route freight trains including heavy coal trains from the Big Sandy Division over the Front Avenue tracks and thus relieve congestion on the main line tracks in the city. The freight station will be enlarged and additional trackage provided in the city. Approximately \$2,500,000 is being expended in the vicinity of Huntington, \$1,500,000 of which is for double-tracking the Big Sandy Division. All expenditures are a part of the road's \$37,000,000 improvement program.

Coming Meetings

American Gas Association, annual meeting Oct. 15-19, Atlantic City, N. J. Secretary-Manager, Oscar H. Fogg, 342 Madison Ave., New York City.

The West Virginia-Kentucky Association of Mine, Mechanical and Electrical Engineers will hold its annual meeting Oct. 19-20 at Huntington, W. Va. Secretary-treasurer, Herbert Smith, Robson-Prichard Bldg., Huntington, W. Va.

American Welding Society. Oct. 24-26, Pittsburgh, Pa. Secretary, M. M. Kelly, 33 West 39th St., New York City.

Harlan County Coal Operators' Association. Nov. 21, Harlan, Ky. Secretary, E. R. Clayton, Harlan, Ky.

Coal Mining Institute of America will hold its annual meeting Dec. 19, 20 and 21 at Pittsburgh, Pa. Secretary, H. D. Mason, Jr., Chamber of Commerce Building, Pittsburgh, Pa.

COAL AGE

The Only National Paper Devoted to Coal Mining and Coal Marketing

C. E. LESHER, Editor

Volume 24

NEW YORK, OCTOBER 11, 1923

Number 15

More Pay—But Less Coal?

NOW that the anthracite miners have gained their uniform eight-hour day—and 10 per cent more pay—it will be interesting indeed to see which way the production per man will tend. In a statement issued immediately after the settlement President Lewis, declared the miners could have won all their demands after a full-length strike and would have done so had it not been that the representatives of the mine workers were “fully conscious of the public interest.” He said further that the miners have “the natural desire that goes with good citizenship, to obviate public embarrassment and discomfort.

If he means what he says he will encourage the men in the anthracite fields to produce and handle all the tonnage of which they are capable in their new eight-hour day every day the whistle blows. That certainly will be in the “public interest” and will help “obviate public embarrassment and discomfort” because it will be a real influence in restraint of the rising cost of anthracite to a public that is already paying heavily for that fuel. Any mine can produce coal cheaper when it is working at capacity, for its full eight hours than it can when its tonnage men at the faces begin slacking off at 2 p.m., leaving little for the rest of the employees—usually more than 50 per cent of the total—to do the remainder of the day except draw a full day's pay.

Somehow one is doubtful that Mr. Lewis intends to give any such encouragement. Instead, the leader of the union appears to be doing his best to make the men feel dissatisfied with their 10-per cent increase. They are encouraged to think the companies owe them more than they are getting. In one breath Mr. Lewis told them he had won for them a notable victory, and in the next that the new wages “are not sufficient to compensate the mine workers for the particular service they render.” There certainly is nothing in history to indicate that unionism teaches men to deliver a full day's work in the anthracite mines. Every increase in pay and improvement of conditions since 1900, when the union got its foothold in anthracite, has failed to stop the steady decline of production per man, so there seems to be no hope now.

Cash Value of a Convention

THE value to the coal industry of a convention such as the American Mining Congress tried to have at Milwaukee two weeks ago, and such as it should have in the future, has an illustration in the Middle West. Loss of coal by overshooting is a common liability. It is especially common in one particular region where too heavy shots have blown coal to dirt for so long that it was accepted as something that was too bad but probably could not be helped. Two months ago an operator in that region was asked to present at the

Mining Congress convention a study of explosives and their proper use. The operator got busy learning all practices in his own territory.

By the time his paper was prepared for the Congress-Milwaukee convention he was so impressed with the losses his own company had been suffering from hard shooting that he was no longer lackadaisical about it. He was so surprised to find that the average shotfirer in his employ was an intelligent and conscientious workman that he wondered why he had never tried to get acquainted with him before. And he found the average shotfirer was so heartily in accord with him in the belief that lump coal could be increased by more careful shooting that he wondered why he had never before enlisted his shotfirers' aid.

The conference on coal shooting which the operator led at the convention raised wideawake interest. This interest was heightened by the fact that he brought some of his own new-found, intelligent shotfirers to the meeting to clinch his points with practical comments.

Aroused, he went home and started a movement in his own mine for more careful shooting. Other operators say they are with him. Leaders among his own employees say they are with him. And so, after all these years of accepting things as they were, something is happening in that region which may add 10 or 15 per cent to the proportion of lump coal the field produces. And it is principally because that operator was called upon to talk at the convention. There are benefits to conventions of that kind. Let us have more of them. And let coal men take part in them.

When a Little Less Is Something More

TO THE operator standardization appears solely as a call to give up certain of his equipment and substitute other of a more general applicability. He realizes that as soon as standardization prevails at his mines—if he has mines with many gages and many types of machinery—he will not have to keep so large a number of spare parts and that, moreover, his motormen and electricians will have less difficulty in understanding the machinery and will therefore be able to maintain and repair it much more readily. There is perpetual labor turnover where a man is turning from one machine to another of a type with which he is unacquainted.

Immersed in his own problem the operator does not appreciate just how the manufacturer views the matter. Here are two makers of some one class of machine. Their designs are different; both are good. If one manufacturer decide that standardization is desirable, he must get the other to assent to it. The maker of one machine must copy that of his rival or the rival must copy his or both must copy from each other to get a new machine that will serve as a standard for both.

In either case whatever concern does the copying

breaks from its own standard and all its clients buying its machines thereafter have difficulty with their stocks. They have thereafter two makes of machine. In fact as far as the change is made in the direction of copying the rival manufacturer's standards the consumer has the equipment that accords with that made by a rival instead of that which accords with that made in the past by the firm from which he has been buying.

During the war it was possible to wipe out such differences between manufacturers but the process did not go far. Any single item, of course, can often be dispensed with if it is not too intimately associated and fitted into other items. It is easy to change the bowl seat on an agricultural tractor but difficult to change a design in a motor if as a result of the change the new part will not fit the old part, making it necessary for manufacturer and consumer to keep large stocks that will accommodate both the old and the new equipment.

Standardization is so important, however, that clamor must be continued in its favor. Only perpetual effort will effect that which is so desirable. Certainly we should arrive at a condition under which it will be possible to have each manufacturer reduce his designs nearer to a standard and make his machinery as far as possible aggregations of a few standards. No one would make a mine car with all its rivets or bolts of a slightly different size, but we sometimes do almost as ill. In a single piece of machinery there often is altogether too much diversity. It is better to have a design which is in places too strong if thereby we can avoid having too many replacement parts.

By keeping this subject alive the American Mining Congress is performing a service to the industry. The manufacturer with too long a line is not a friend of economy. He serves well neither the operator nor himself. A variation that has no justification is to be avoided for the good of all concerned.

Earthquakes and Music

THE condition of a man's stomach has a good deal to do with his state of mind and tone of voice. In Illinois, where union coal miners' stomachs have been full for years, do we hear any sweet union utterances of brotherly love for operators? We do not. Instead, seismographs record the disturbances set up by union demands and condemnations. But how is it in that part of the State of Washington covered by District 10 of the miners' union organization? The tone of the union official voice is melodious and soothing there, for a man eating only one meal a day, so to speak, and that one paid for by a public that grudges the high cost of it, realizes that he cannot get the other two by raucous roaring. So peace reigns in District 10, albeit a worried peace.

Last April the miners of that district, after a long and losing battle for standard union wages, took a 10-per cent reduction with greatest reluctance because there was absolutely nothing else to do but starve. The coal of the region simply could not be sold when the production cost included the country wide union scale. The market for it has been limited indeed, even with wages 10 per cent below the scale, thanks to competition from oil, wood, and coals from Canada and non-union Northwestern fields. Any coal mine in that territory has market difficulty enough even at favorable wages. It is not a question of what operators wish to pay. It is a cold question of economics.

But the union miners of Washington with their one meal a day are not convinced. To them the whole source of their trouble is non-unionism in their own state, in Vancouver Island, in Colorado, Utah and North Dakota. Could they but solidify the miners in those districts and level up by force the scale of wages, their troubles would be over. So their perennial campaign is on once more. There must be something going on lest the union organizers be out of a job. The foundation for the campaign is harmony. Everything possible will be done to convince the whole West that union miners are a sane, reasonable and peace-loving class of men. Those in Washington are doing their level best to prove that unionism is willing to give and take and that it is easy for peaceful relations to exist between miner and operator.

So far as the average rank and file miner is concerned, such a Utopian condition could exist. The operator of non-union Colorado and non-union Utah does not feel that the average of his men is vicious. It is as high an average as that of most other industries where friendly relations are maintained between employer and employee. But unfortunately the average opinion of miners is lost when unionism enters. Only the opinion of a dominating few strangers prevails. That is the main reason why there is so little mutual satisfaction in dealings between the operator and the miner of Illinois or any other solidly unionized state. That is the reason why the seismograph records the crashing official utterances of unionism in well-fed Illinois while today in District 10 of Washington a delicate phonograph recorder makes music of union words.

SOME CHICAGO RAILROAD MEN say the coal industry ought to have a labor board such as the railroads now have. In spite of its drawbacks and lack of power to enforce decisions, the labor board has improved conditions, and it ought to stop a lot of striking and grief in coal, they insist. They forget that such a board might, perchance, make a decision running counter to the wishes of John L. Lewis. Would it be obeyed? Did John L. Lewis obey the President of the United States just before the great strike of 1922? Does the miners' union obey anything or anybody? The answer is, "Pfft!"

STEINMETZ, THE ELECTRICAL WIZARD, believes he is 25 years ahead of his time with his prophecy that full use of electrical machinery will produce a four-hour well-paid working day. He ought to meet some of these union Illinois loaders coming out at noon after a fair morning's turn of cars and with \$10 due. They haven't waited 25 years and they refuse to use electrical loaders.

IT IS REALLY TOO BAD that some of these newspaper editorial writers who hoot at the United States Coal Commission could not have been on the Commission. Immersion for a year in the Sargossa Sea of the coal industry might impart some idea of how hard it is to straighten everything out with a few bold strokes. They should ask the editor-commissioner from Atlanta. He knows.

ONE OF THESE DAYS a man is going to devise a settlement of a strike that will not add to the public's burden of cost; and a grateful nation will probably elect him permanent dictator, or something.—*N. Y. Sun and Globe.*

Lynch Mine, Its Record Production and Operating Data

Every Mine Engineer Will Be Interested to Measure Results with Those of Biggest Producing Coal Mine in World, Remembering, Moreover, the Operating Difficulties of Lynch Field

BY ALPHONSE F. BROSKY

Assistant Editor, *Coal Age*, Pittsburgh, Pa.

BY PREPARING on the tipple and shipping 12,880 tons of coal in a single shift, the United States Coal & Coke Co. at the Lynch operation, Harlan County, Kentucky, achieved a world's record for the tonnage both prepared and loaded in a single day at a single coal preparator. Not even the huge breakers in the anthracite field have ever equalled this record. However, mere grossness of tonnage is of less importance to us than the significance which may be attached to it as a measure of advanced development in mine-plant layout.

If anything of the spectacular could be attributed to this record it would be the ease with which it was made. Without advance notice to the men and with scarcely a flurry, 6,784 tons of coal which was mined fresh that day, 2,587 tons held in the storage bin and 3,509 tons in mine cars were passed in one shift over the screens and picking tables to the railroad cars on three tracks under the tipple.

Another record was posted at Lynch when 167,346 tons of coal was mined during the month of May, 1923. This record supersedes that made at the Zeigler mine of Illinois in the month of March last year. The accomplishments at these operations are not to be compared, for conditions are vastly different. At the Zeigler mine coal is hoisted in skips up a single shaft.

*The headpiece shows in the foreground the dumphouse for No. 31 mine and somewhat further back the machine shop. In the rear is the opening to Mine No. 30, the bathhouse, the bank, the residences of the officials, the store and the hotel. The storage tracks above the tipple will hold more than 200 railroad cars.

Coal is won at the Lynch mines by drift mining, the coal being hauled from two openings on either side of a single tipple. In this regard Lynch had the advantage. But in the matter of grades of haulage roads and conditions favorable to mining, Zeigler had "the edge" as compared with Lynch because at the latter mine the coal is not flat, as in the former, but rises and falls everywhere in the territory thus far developed. It is not, however, my purpose to detract from the glories of either of these two mines. Following a statement of facts and conditions which governed them, comments will be made on the methods employed and on the equipment used at Lynch, which enabled a large production to be made despite difficulties in mining.

MAY PRODUCE TWO MILLION TONS THIS YEAR

Insufficient car supply, which has prevailed in practically all parts of the country, has had its effect on production at Lynch by making impossible greater development than that absolutely necessary to maintain a somewhat constant daily output. Indicative of this condition are the figures of production for the years since the mine was opened in the autumn of 1917. The production for that year was 12,392 tons; in 1918 it was increased to 541,344 tons, followed by 1,242,639 tons for 1919. For 1920 and 1921 the yearly productions were 1,338,707 and 1,541,629 tons respectively. In 1922 the production fell to 1,217,323 tons, due to a railroad strike. But for the first six months of 1923

Constructing Coal Bin

Tippel bin has a capacity of 5,000 tons and is said to be largest structure of its kind in the world. It was the biggest item in the cost of the tippel, but it is paying for itself by providing steadier operation. Note the elevator tower and suspended spouting by which concrete was poured into forms.

the output bounded to 1,004,424 tons, and no doubt it will pass the two-million mark for the entire year.

In less than six years the two mines at Lynch have developed to such an extent that they load over one tippel a production greater than other large mines which have reached the apex of production. At that, the mines at Lynch are still in their infancy. Some day each will produce more coal than has thus far been obtained from a single opening, and their combined tonnages will pass over the one tippel at the rate of 2,000 tons per hour.

The combined daily output from these two mines, which has averaged about 6,000 tons, cannot well be increased until such time as the carriers upon which its transportation depends can be so equipped as to assure a sufficient car supply to warrant that larger production. The town of Lynch has not been enlarged since its first construction, for this very reason. Only as many houses have been provided as are necessary to meet the requirements of the men needed to mine the coal that can be shipped. Likewise, no more men have been employed than can be assured a whole day's work on each working day. This is a rule which must be followed to obtain highest efficiency in mining.

However, the short supply of railroad cars which has acted as a deterrent to large production at Lynch afforded an opportunity to test the functioning of the enormous tippel running at 71.5 per cent of capacity. On the two working days preceding Feb. 12 no railroad cars were received. A delay in transportation and not a shortage of railroad stock must have been the cause of this failure, for on the big day 230 railroad cars were delivered. Each had a capacity of 56 net tons and all were loaded that day. A surplus at the end of the day's run was sufficient to fill 12 additional railroad cars.

A train made up of all these cars would be 1.65 miles long. Still more vivid than this mental picture is that of as many Lynch mine cars made into one trip as would be needed to hold the shipment for that day. Such a trip would be about 12 miles long. The principal roads in the two mines are laid with 40- and 60-lb. rails. The total length of roads equipped with rails of that length is 38 miles. Consequently the trip suggested would be one-third the length of these roads.

Incidentally the shipment represented about 0.75 per

cent of the total production of bituminous coal in the country for that day. Calculating the output of Lynch in another way, about 267 mines having the average production of Lynch could meet the present consumption of bituminous coal in this country. Less than one hundred operations having the ultimate capacity of the Lynch mines likewise could meet this market. We know that our coal bodies are not such as to make feasible the working of so many mines of gigantic output; nevertheless we can visualize what savings might be effected by such mass production. It is some assurance to know that the amalgamation of small into fewer large companies would partly bring about this change. Certainly with the stabilization of production, which is so fondly looked for in the future, a movement will be launched in this direction.

As has already been said, of the shipment that day, not all was fresh mined. On the two idle days preceding, development work was prosecuted as usual and in those working places needing attention coal was mined. In every mine there are places in which the

mining must be continued from day to day if the coal reached by them is to be completely recovered with the least effort or with the least exposure of the miners to danger. Especially is that true of pillar sections where a wing pillar or a stump has been left standing.

At Lynch the absence of railroad cars does not halve such work; though several days may pass without a delivery of cars, the most important work continues because facilities are afforded for the storage of the coal in the bin on the tippie and, if need be, some of the coal can be stored in the mine cars. Such a condition prevailed when the whistle blew on the morning of Feb. 12 and the tippie machinery began to move. In the bins were 2,587 tons of coal and on the tracks were 1,426 loaded mine cars, of which number only 1,148 contributed to the day's production. When all the railroad cars were filled, 278 mine cars filled with coal were left undumped.

Fresh-mined coal on that day aggregated 6,784 tons, which was loaded into 2,463 mine cars by 553 coal loaders. The average output per loader was 12.25 tons. It is less than that for the month of May, when the average output per loader per shift was 13.05 tons. It is natural to expect a change from time to time in the rate of loading coal where conditions are different from day to day. One day a working place may be on the level; the day following it might dip or rise. More will be said in a later article about these conditions and the difficulties in mining.

Of the 1,347 men on the payroll that day, 297 were engaged in outside work, and of the latter about 100 men were employed in construction work which will not be going on at all times. Including these men who had no direct part in the mining of coal, the production per man on the payroll is 5 tons; without them it is 5.43 tons.

SOME OF THE SLATE IS DUMPED IN MINE

Altogether there were 1,050 men underground, including 417 company men, 553 coal loaders and 80 machine men. The average output per man underground was 6.45 tons. In the Lynch mines during the month of May for every 4.6 coal loaders one company man was employed in loading slate. For every 4.84 cars of coal dumped on the tippie, one car of slate is hauled to the outside and conveyed to the hillside dump. In addition much slate is gobbled inside the mine. Where so much slate must be handled, the output per man is lowered.

Though the usual number of machine men in 40 crews were working that day, only 239 places were cut. More than twice as many places are cut normally by that number of crews. All the places were cut in a previous shift in the expectation that railroad cars would be received. Some of them were left standing while those loaded out contributed to the coal in storage in the tippie bin and in mine cars.

A more comprehensive study can be made of produc-

SURFACE PLANT AT LYNCH MINES FROM SOUTH SIDE LOOKING WEST

Fortunately, the Lynch Mines have little surface haulage. Just enough is provided to get the coal out of the cars and the empty trip assembled. In the foreground

can be seen one of the two dumphouses which handle the 1,800 mine cars which are brought to them by twenty-five locomotives. The tippie, conveyor sheds, slate conveyors,

junction tower for coal and slate conveyors, power house and machine shop readily can be distinguished. The hills show how the average cover soon becomes 2,500 ft.

tion and the labor involved for the month of May of this year. For convenience, figures are compiled in Tables I and II, which furnish a ready reference. During that month of 27 working days the car supply was comparatively good. Consequently the Lynch mines were able to operate steadily at the average rate of 6,200 tons per working day. The maximum output for the mines to date was reached on May 11, when 7,089 tons of coal was mined. The lowest production per day during the month took place on May 16 when it fell to 4,988 tons.

The most notable fact which is revealed by figures

for these two days is that the operator's profit in mining is seriously affected by a fluctuation in car supply. Thus on the day of biggest production 7,089 tons was mined with 1,476 men at the rate of 4.8 tons per man, while on the day of smallest production 4,988 tons was mined by 1,334 men, at the rate of 3.73 tons per man. The difference in the output for these two days was 2,101 tons. Only 33 company men above those required for May 16 were employed on May 11 to produce this surplus tonnage. The production per company man on May 11 was 9.30 tons and on May 16 it was 6.85 tons, which means that the labor of company men cost about 36 per cent more on the latter day than it did on the former.

For the month of May, 2.1 man-hours was required per net ton of coal mined. If the 100 men on each day's payroll who are engaged in work other than that directly bearing on mining are excluded, 1.95 man-hours would have been expended in mining each net ton of coal. These figures may appear high, but one must consider at the same time the conditions which prevail in the Lynch mines, causing difficulty in mining.

OUTPUT PER MAN AVERAGES 4.7 TONS PER SHIFT

The men on the payroll during the month of May have been classified according to their several duties. In Table II is listed for each class the average output per man per shift. Those figures, which are compiled by including the full quota of company men on the surface, are really too low. Including all men on the surface, the average output per man on the payroll per shift during this month is 4.4 tons; not counting the hundred men whose duties do not concern the mining of coal, it is 4.7 tons.

Each of the 43 men employed in the dumphouses and on the tipple handles an average of 145 tons of coal per shift. The ultimate production of 16,000 tons per shift can be handled by the addition of a few more men on the picking tables and in the dumphouses. From this it may be deduced that the greater the output of the tipple the bigger the production per man employed on it.

TABLE III—TONNAGE AND POWER CONSUMPTION, ACTUAL AND DEDUCED, MAY, 1923

* P = 22,000/T where P = power consumption per ton of coal and T = tonnage per day in period for which P is taken.

Railroad Tracks Under Tipple

Three railroad cars can be loaded on each track—that is, nine in all—at the rate of 500 tons in three minutes, the coal coming from the storage bin. The railroad cars run under the floor of the bin, which is an integral part of the tippie. The unusual posts under the bin, devoid of crossbracing, make travel easy and safe, despite the presence of moving railroad cars.

In Table III is given the power consumption by days for the month of May. The total power consumed in mining and handling the month's production of 167,346 tons is 629,332 kw.-hr., or 3.76 kw.-hr. per ton of coal mined. The total power consumed for mine and town during this period is 779,900 kw.-hr. The ratio between the consumption of power for purposes other than mining and that for mining is as 5 is to 21. From this ratio one perceives how big is the consumption of power in the modern mining community.

A comparison of the consumption of power at Lynch per ton of coal mined with the tonnage for the days in May, as exhibited in Table III, shows that these are algebraically related: that is, the power consumption per ton of coal mined under ordinary operating conditions varies inversely as the tonnage for that day.

Representing the power consumption per ton of coal mined on any day by P and the tonnage for that same day by T then

$$P \text{ varies as } \frac{1}{T} \text{ or } P = k \frac{1}{T} \text{ and } k = PT$$

in which case k is a constant equal to PT . But PT is the total power consumption for any day, so, by averaging the total power consumption for a specific period of days a constant k is obtained, which may be used in calculations for any day in that period.

EMPIRICAL FORMULA GIVES CLOSE RESULTS

The calculated value for constant k for the month of May, excluding Sundays, is 22,000. Then the formula as applied becomes: $P = \frac{22,000}{T}$ in which P is the power consumption for any day in kilowatt-hours and T is the tonnage in net tons.

Using this formula, I have derived for each day in May the power consumption per ton of coal mined. The derived values and also those calculated directly—by dividing the total power consumption for each day by the tonnage for that day—are listed side by side in Table III. A calculation has been made and tabulated showing how little in error is the derived power consumption per ton of coal mined when compared with

the directly calculated value. This error is expressed in a percentage.

The figures show that the relation actually does hold true on average working days. For 20 of the 27 working days the percentage of error of the derived value is less than 5 per cent and in most cases it is less than 3 per cent. For 7 days, however, it is more than 5 per cent. But the calculated values of power consumption per ton of coal mined for these seven days are more or less distorted as compared with the calculated values of power consumption per ton of coal mined on other days on which the tonnage produced approximated the respective tonnages produced for those 7 days.

One may deduce from this peculiarity that operating conditions on those 7 days were such as to cause a consumption of less or more power than would be consumed under average conditions. Nevertheless, the derived and the directly calculated values of power consumption per ton of coal mined are so surprisingly alike for most of the days tested as to hint that the suggested relation has a basis of truth. It is reasonable to expect this relation as the totals of power consumed, see Table III, for all working days are closely alike within limits. The power consumption for May 11 was only about 10 per cent greater than it was for May 16, and yet on the former day the tonnage produced was about 40 per cent greater than the tonnage mined on the latter day.

MAXIMUM PRODUCTION MEANS LOW POWER COSTS

Under existing conditions at Lynch—and those which now exist at any other plant, for that matter—the maintenance of a steady daily output, were it possible, would result in a considerable saving in the cost of power per ton of coal mined. Irregular car supply and a fluctuating demand for coal prevent uniformity in daily tonnage.

If 7,000 tons of coal is mined in the Lynch mines on Monday and only 3,500 tons are mined on Tuesday, the cost of power per ton of coal mined will be twice as great on Tuesday as it would be on Monday. Incidentally, this saving is only one of many which could

THREE OPENINGS TO NO. 31 MINE

One opening is occupied by the 12-ft. fan, which will pass 400,000 cu.ft. of air per minute against a water gage of 3 in. At present it develops only 120,000 cu.ft. of air per minute against a water gage of 1½ in. It is driven by a 100-hp. motor at 120 r.p.m. The small opening is for empty trips, the large for loads.

be made to reduce the cost of coal at the mine should our mines be provided with an opportunity to produce a uniform daily output.

The total capacity of the electric motors at the Lynch mines, for alternating current and direct current, is about 7,000 hp. This figure includes all motors used in mining and handling the coal but does not include those used for town purposes. Correlating horsepower with production, one finds that for an average of 6,200 tons of coal per day there is about 1.15 hp. per ton of average daily output.

For May 11, however, when 7,089 tons of coal was mined, there was only 0.99 hp. per ton of coal mined. With the present capacity of motors a much higher tonnage could be obtained. It is likely that no more than 0.75 hp. per ton of average daily output will be required when the mines are developed to capacity. But as the workings move further into the mountains the figure will be bigger. For the life of the mine a fair figure would be one horsepower per ton of average daily output.

DUMPHOUSES TO HANDLE 18,000 TONS PER SHIFT

Let us turn for a moment to the dumphouses and the tipples which played the important part in the record loading of Feb. 12. Each of the two dumphouses as designed is intended to handle 9,000 tons of coal in a nine-hour shift. The plan calls for two rotary dumps in each dumphouse. That these will be ample to handle 18,000 tons per shift is evidenced by the feat accomplished on Feb. 12. On that day two dumps, one operating in each dumphouse, handled 10,293 tons of coal. Of this quantity, the dump on the side nearest to No. 30 mine, from which most of the production now comes, handled about 6,800 tons of coal. At that rate four dumps will furnish a combined capacity 50 per cent greater at least than the tonnage they were expected to handle.

The most noteworthy and important feature of the equipment in the tipples is the belt conveyors. The success at Lynch of these devices for handling the coal from the mine car to the railroad car and for carrying the mine refuse to the slate dump points the way to their much more extensive use in the future.

Development of their application is only begun and gives promise that they will displace steel-pan conveyors for every purpose except for picking tables. Their life, figured in tons carried and not in years, is sufficiently long to warrant their adoption as an economy. Their ease of repair also commends them for more extensive use.

The normal capacity of the tipples is 2,000 tons of coal per hour. This aggregates 16,000 tons of coal per eight-hour day. The tipples are designed also to handle whatever slate incident to mining must be dumped on the outside. With all the conveyors carrying a capacity load it is estimated that about 18,000 tons of coal and slate combined can be handled in a single shift. The slate conveyors have a capacity greater than 2,000 tons per eight-hour shift, but it is not likely that even that quantity will have to be handled at the tipples in any one period of eight hours.

Of great interest are the mining methods at Lynch by which, considering the youth of the mine, the present unusually large rate of production is derived, and by which in the future the present rate will be nearly trebled. A system which, without jeopardizing plans for future development, will yield 1,242,639 tons of coal in one year, as in 1919, less than two years after ground was broken, holds enhanced possibilities for mammoth yearly production six, eight or ten years hence.

How today's output is attained or how in the future it will be increased threefold is a logical question to ask. It is not so much a question of how the coal is mined as it is what methods are employed to get the coal to the surface. So gigantic a production for one mine—1,000 tons per hour, hauled over one haulage system—has never been achieved in drift or shaft mines. But there is no reason why it cannot be obtained, from a drift mine especially.

Difficulties encountered in shaft mines—such as congestion of trip traffic at the shaft bottom through the impracticability of constructing sufficient storage tracks—have limited the output to a maximum normally of about 6,000 tons per day. Our past methods of hoisting coal to the surface and the size of our mine cars have in many cases restricted production. Had the methods and sizes been revised some of the shaft mines already constructed would have attained a daily output equal to that which some of the new shaft operations are expected to develop. From the latter as much as 10,000 tons of coal per day will be taken, but for that end equipment of greater capacity than that now used has been designed, and with this new machinery will go methods differing in general from those hitherto adopted.

Marked Increase in Germany's Imports Of Coal During Ruhr Blockade

Imports of bituminous coal during the period January to June of this year were 14,720,646 metric tons, according to the German Bureau of Statistics, as compared with 2,102,215 tons in the corresponding period of last year and 5,028,472 tons in the same months of 1913. The tonnage furnished by various countries is shown in the following tabulation:

	1923	1922	1913
Sarre.....	103,624	410,346	
Great Britain.....	7,756,627	1,526,581	4,379,817
Czechoslovakia.....	155,377	78,448	
Poland.....	6,549,641		
Belgium.....			189,173
Holland.....			264,112
All other countries.....	155,377	86,840	195,370
Totals.....	14,720,646	2,102,215	5,028,472

The increase of imports this year compared with last year is due partly to the Ruhr blockade and partly to the loss of the greater part of Upper Silesia. Over 6,200,000 tons was supplied from Upper Silesia, which supply figured last year as domestic production.

Typical Room, Lynch Mines, but Dipping 22 per Cent at Face

Lynch Coal Buried in Places 3,500 Ft. Deep; Methods By Which High Percentage Extraction Is Attained

New Measures Adopted to Hold Heavy Cover and Slate Roof—Every Loader Required to Clean Up His Room Daily—How Mine Is Laid Out—Swags, Hummocks and Loose Slate Afford Many Problems

AT LYNCH, methods of mine layout have been adopted permitting coal to be mined and hauled economically, not for the youthful years only but for the whole life of the mine. Although it has been granted by most mining men that the ideal system of mining, so far as percentage recovery and ease in extraction are concerned, is to drive to the boundary and to remove the coal on the retreat by rooms and pillars or by a system of longwall, that idea has been set aside as impracticable. The chief reason given is that a mine is opened for the immediate present as well as for the future.

However, if that ideal is removed from consideration, equally so is that crude plan whereby two or more independent panels are opened up and these worked in the manner of "catch as catch can." This is no longer tolerable by reason of its wastefulness of our declining coal resources. So far as railroad facilities and the market for coal will permit, uniformity in production should be perpetuated from day to day and from year to year throughout the life of each section. This is the fundamental principle upon which the Lynch system of mining is based.

At the Lynch mines the methods of mining originally adopted have been modified somewhat to cope with conditions which later arose. A general description of the plan of mining adopted in the early stages of operation was given in an article on the "Lynch Plant of the United States Coal & Coke Co.," presented by Howard N. Eavenson to the American Institute of Mining

and Metallurgical Engineers at its Wilkes-Barre meeting, Sept. 12-15, 1921. The article can be found in the issues of *Coal Age* Sept. 22 and 29 and Oct. 6 and 27 of that year, the second section relating specifically to the mine layout. These paragraphs which deal with this subject are repeated here to enable the reader better to note what changes are involved under present methods.

The excerpt reads: "The mines are laid out on a compromise between the advancing robbing system and operation on the retreat. Principal headings are driven so far apart that between them there is room for four rooms end to end. These headings have an empty and a loaded track and two airways and they will be driven up to the boundary without turning a room. They will be flanked by barrier pillars so wide that a full-length room may be driven in the distance across them, but the heading pillars will be left unworked till the boundary is reached, when rooms will be driven into them and the pillars brought back on the retreat. In the drawing these pillars are noted as the barrier section.

"Between two principal headings are, of course, two barrier sections, leaving two other sections each as wide as a room is long. These are used to maintain tonnage till the barrier is reached. Two room headings are driven and each removes what is marked as a room section. The coal from these sections is won entirely on the advance.

"Some of the principal headings will be three miles long. By the system described a uniform output can

FIG. 2

Digging Down a Knoll

Headings used for haulage must be graded to remove the many rolls on the seam. The top must be brushed or the bottom lifted almost everywhere along these headings. In this case 43 in. of bottom is being lifted in No. 6 right off No. 31 main. This is, however, not a particularly bad manifestation of these frequent bumps and sumps which make haulage difficult. Note how the workman is aided in his work by electric lamps.

tons of coal per day. To get this tonnage the section boss must see that all places in his precinct are loaded out.

A 14-ft. room in the 5-ft. seam being worked at this mine will give up seven cars of coal per cut, the total weight of which is about 21 tons. If the thickness of the coal diminishes to 4½ ft. at a point along a room heading, then the room may be made wide enough to yield the full quota.

In the early stages of development in these mines, when the workings were not far under the mountain, a good sandstone roof was encountered which held the weight of the cover above the rooms and headings securely enough to permit of a 36-ft. room. That width was enough to accommodate two or three men, and excellent results were obtained. Later, however, after mining activities were extended into the mountain, the roof changed from sandstone to slate and would not hold up over a wide place unless an excessive quantity of timber was used.

The great weight which the heavy mountain cover brought to bear on the coal was a factor influencing the change to a narrow room. In places the cover has a thickness of 3,500 ft., and the average is scarcely less than 2,500 ft. Thus the narrow room must be used.

There are yet other reasons for the adoption of the narrow room. The cover usually is heavy, greater even than that resting on most of the deep mines of Belgium. It is so heavy that it is advantageous to use it to break the coal in pillar sections. Thereby much difficult and costly machine cutting is eliminated. The narrow room affords a greater concentration of working places than does the big room. By making rooms narrow and pillars wide, the heavy cover will break out the coal, facilitating pick work and making machine cutting in pillars unnecessary. In consequence the more pillar work the better, for the coal is not mined to obtain lumps. More slate must be handled in a given area when the rooms are wide than when they are narrow, for the roof span is longer and the slate is subjected to a greater strain. Moreover, with a wide room more timbers have to be set.

In his article Mr. Eavenson says: "Between two

principal headings are, of course, two barrier sections, leaving two other sections each as wide as a room is long." These latter sections are termed room sections. In speaking of a territory that is mined as a unit, all the coal from which is hauled over one principal heading, I will use the term "mine area." In order that the reader may conceive what constitutes a typical mine area, he is asked to refer to Fig. 1. A four-sided territory inclosed by dot-and-dash lines and marked *ABCD* is pierced by No. 1 flat right off the main heading. It comprises a principal heading flanked by two barrier sections.

MINE AREAS MADE OF DIFFERENT WIDTHS

Though the typical mine area has only two-room sections, three-room sections have been included in several areas for the purpose of dividing the property to better advantage. The results from each are almost equally good, but the smaller mine area has advantages which will be discussed in connection with the haulage system. The area which is designated as *GFEDH* in Fig. 1 has three room sections. It will be noted that a barrier heading was started outby from No. 1 flat right off the main heading and then stopped because of adverse conditions. Consequently that block of coal which should have formed a barrier section to the outside of the barrier heading known as No. 1 flat right became the third room section of the adjoining mine area.

In Fig. 1 a double section is indicated by *FKLE*, consisting of two-room sections on the outby side and three-room sections on the inby side of the barrier or heading known as No. 7 flat left off No. 1 haulage right. This section was laid off in this manner primarily to divide up to better advantage the territory between the main heading and the boundary line on No. 1 haulage right. The territory inby beyond the first mine area of this heading was not large enough to accommodate two mine areas so what should have been the second and third mine areas were combined to form one double area.

The room section of a mine area closest to a barrier section will be termed the first room section and the one beyond it will be called the second room section. As

the two-room sections are completely mined advancing, the rooms in the second room section must be kept in advance of those in the first room section. Rooms are laid out in pairs—that is to say, on one side of the room the pillar is wide and on the other side it is narrow. Those in the second room section are driven alternately on 36- and 64-ft. centers, and those in the first room section are driven on 36- and 90-ft. centers.

STRONGER PILLARS LEFT IN APPROACHING GOAF

The reason for the difference is obvious. Rooms off the second room section of a mine area are stopped (or "butted off," in common mining parlance). Consequently they terminate in a block of solid coal, which aids appreciably in supporting the roof load. Rooms off the first room heading of a mine section are driven through to the goaf of the adjoining room section. The unbroken roof projects as a cantilever over the room pillars of the first room section into the mined-out goaf of the second room section. Therefore, the wide room pillar of the first room section is left wider than the wide room pillar of the second room section.

The 22- and 76-ft. pillars in the first room section and the 22- and 50-ft. pillars in the second room section are equivalent at least numerically to an average width of 42.5 ft. As the width of a room is 14 ft. and the average width of a pillar is 42.5 ft., the ratio of first mining to second mining is as 1 is to 3. This means that 25 per cent of the coal won from rooms is obtained by mining into the solid and 75 per cent is removed by drawing pillars.

Headings in mine areas whether they be for haulage purposes or for ventilation are now driven 12 ft. wide. As first designed the air courses are made wider, but as with the rooms their width was reduced in order that the roof over them might have better support. The air-courses and haulage headings of a room heading are driven on 70-ft. centers, but the four headings which constitute a barrier heading are driven on 60-ft. centers for the reason that they are further supported by the barrier sections on either side.

Rooms are driven so as to make an angle of about 70 deg. with the room heading. In the first room section they are 440 ft. long. Those in the second room section are driven so as to govern their length and to prevent "hogging" beyond that limit into the barrier beyond. Sometimes this butt-off is carried far in advance of the last room driven up to it.

Room pillars are drawn by first driving a pocket 14 ft. wide so as to cut off a wing wide enough to sup-

port the roof safely while further operations are being performed. Consequently the depth of the wing pillar from the pocket to the goaf varies according to the roof load upon it. Usually it is made deeper on a narrow pillar than on a wide pillar. A room pillar is brought back about 40 ft. before the adjacent one on the advance side is started.

When the first room pillar of a room section is brought back and to the heading, 18 rooms are being pillared back and 10 rooms are being driven up. Thus a typical mine area of two-room sections will furnish about 56 working places in rooms and 8 in the headings which are being advanced.

A group of sixty-four working places is supposed to yield 1,000 tons of coal or more each working day. A place 14 ft. wide, undercut $7\frac{1}{2}$ ft. in the 5-ft. seam being worked, will yield, as stated, 21 tons per place. A heading 12 ft. wide yields less than that, but the shortcomings of a working place in a heading so far as its yield per cut is concerned is balanced by the fact that more than 21 tons per working place is obtained when drawing pillars.

USUALLY OBTAIN MORE THAN 1,000 TONS PER DAY

For convenience one may assume that each working place theoretically yields 21 tons. If development in the headings is worked double shift, as is customary, no more than 48 cuts in 40 places would have to be loaded out. This gives elasticity to the average tonnage required from each working place and as a result more than 1,000 tons per day usually is obtained.

At this rate not all places have to be worked to produce the necessary tonnage for the area or if the average tonnage per place drops below this mark the basic tonnage for the mine area can still be maintained by working more than 42 places. Thus with all places in a mine area working, to produce 1,000 tons per day each place need yield only 13.9 tons.

By referring to Table II in the preceding article, the reader will discover that the average tonnage per loader per shift during the month of May, 1923, is 13.05 tons. In spite of the fact that much development work is being done and much rock has to be handled in some mine areas, the absolute average tonnage per man per shift required theoretically to produce 1,000 tons is almost obtained in actual practice.

Division of labor is not carried as far at Lynch as it is in some mines, as for instance in many of the coke region mines. It has been said that company men should be employed to prepare the coal at the face

FIG. 3

Driving a Pocket

Pockets, or cross cuts, are driven near the end of a pillar for removing the coal adjacent to the goaf. Note the excellent cap pieces and on the left the electric-light wire. Rails are laid only temporarily as in a few days the place is closed in.

FIG. 4

Filling Slate Larry

Slate is disposed of by conveying it to a storage bin on a belt conveyor 686 ft. long which rises 209 ft. above the tippie. Two refuse stacking cars carry the slate to the point where it is dumped on the mountainside.

for the loader, so that the latter will have no other duties to perform other than to load out his coal, square up his place and remove whatever slate near the face is in danger of falling. This company believes that a too intricate division of labor is not economical.

For instance, let us suppose that men are employed to drill the shotholes in the various working places in a given section of a mine. If an electric coal drill is used the time required to drill three holes is not more than five minutes. In most cases it is less. But the time required for the driller to move from one working place to another on an average is greater than five minutes.

The interval between actual working periods would be about ten minutes, which means that two-thirds of the driller's time is wasted in getting from place to place. But because of the recital of these facts it should not be supposed that the company discourages the use of the electric coal drills; it merely believes that more of them should be placed in the mines and so distributed as to be at the disposal of more men.

The initial cost of such drills is not high; in fact it is so low that by dispensing with the services of one driller for a period of one year enough could be saved to pay for as many electric coal drills as would be required, at the rate of one for every two working places, in the section otherwise looked after by one driller.

THINK LOADER SHOULD DRILL OWN SHOTHOLES

It is the belief of the management that the coal loader should drill his own shotholes, using either a hand auger or an electric coal drill. He also should lay his own track, a job that will take about fifteen minutes each day. The two operations along with the loading of coal are continuous, and no time is lost in needless travel. With but few exceptions loaders will quit work for the day as soon as they have loaded out one cut, even though they have completed it by noon. They feel that they have done a fair day's work and are satisfied with their day's earnings; consequently they leave the mine. A period of 30 to 45 minutes consumed in drilling shotholes and in laying track added to their time for loading coal is not an imposition upon them as some of it can be done while the loader is waiting for cars and the compensation is such as to remunerate them for this extra work.

Under heavy cover mine workings usually are dry if the strata are not broken. Underground circulation of water normally is downward but in mountains it is not likely to reach far from the surface vertically or far inward horizontally. Openings in the rocks are small because of the great weight of the cover and not con-

tinuous, so they do not form passages for the flow of water. Consequently even if water is present it is not likely to be flowing.

As a rule the workings are quite dry, for little water finds its way into the Lynch mines through the strata or otherwise. Some water gathers in a few confined swamps by filtration through those parts of the cover which are not thick. In such cases it is drained into the seam below, which is now being developed to provide drainage ways. Thence it is drained by gravity to the outside.

The rarity of blowouts of cable in the underground transmission system is indicative of the dry condition of most parts of the mine and the excellent drainage wherever water is encountered. Fiber conduits incased in concrete alongside and below the level of the track of main headings carry 16,000 ft. of alternating-current cables; about 4,000 ft. more is being laid and there is a certainty that the system will be 10 to 12 miles long when its maximum extension is reached. This phrase of the operation will be dealt with in an article later.

Big Looney Creek lies below the seam along that part of its course over the property which lies west of the drift openings; but to the east, in the direction of its headwaters, the stream lies above the body of coal. In that direction for some distance the cover between the stream and the coal is not thick. Fortunately, the acreage of coal which might in mining be affected by the close proximity of the stream is not large. The coal which lies under the stream and between the stream and the main heading of No. 30 mine as far as the heading has been extended cannot be mined extensively at the present time. A break caused by subsidence, were the coal to be mined out, would empty the stream into the mine workings.

However, some headings and rooms have been driven that do allow some of this water to enter. The water thus admitted is impounded by dams within the mines and furnishes a water supply for town purposes. Although pure it is, of course, treated before being used. The workings are driven northeast from the main heading, which runs practically with the creek, as shown in the map accompanying this article. To this end, five left flats have been driven from the main heading and five more are being driven.

Concrete dams are built 260 ft. from the main heading in what were the haulage roads and air courses comprising each left flat. These dams are put down to solid bottom and are extended 2 ft. into the roof and 9 ft. into both ribs. The thickness of the dams is 6 ft. at the bottom tapering to 4 ft. at the top. They

are poured with a rich mix to make them watertight and troweled to a smooth finish on the outside. For the core of the dams the rock aggregate is 3 in. and for the finish it is $\frac{1}{4}$ to $\frac{1}{2}$ in.

WATER IN UNDERGROUND RESERVOIR SERVES TOWN

An estimate of the capacity of this underground reservoir is 35,000,000 gallons. With the added capacity of the rooms and headings now being driven for the purpose, facilities for the storage of water will be sufficient to furnish a generous water supply for the town during the dry seasons when the creek dwindles from the torrent that it is in the spring of the year to the size of a brook.

At Gary, W. Va., where the company operates its other mines, the grade of the stream in its vicinity falls with the dip of the synclinal. Thus the stream bed is partly or entirely emptied of its water, depending upon the season, and flows in the openings in the strata instead of staying on the surface.

As a result ground waters are abundant, and holes drilled for water seldom are dry. At Lynch the reverse is true for the fall of the stream and the dip of the rock formations point in opposite directions. Consequently the supply of water from wells is small.

Underground storage of water is the only possible solution of the problem at the present time. A dam upstream is impracticable in that it would be a menace to the town and plant below.

Many difficulties are met in the Lynch mines. However, these are overcome so well—naturally at an increased expenditure for labor—that production does not suffer on their account. Most of them are caused by rolls in the coal which makes necessary much brushing of roof and taking up of bottom on entries that are used for haulage. Fortunately, from the crests and troughs of the waves in the seam the coal falls or rises again to a base level.

The coal may fall in a dip of 30 per cent for a distance of 100 ft., then extend across a level table for 100 ft. more, only to rise again to the base level. As a rule the rolls are not so pronounced, yet the undulation of the seam is persistent enough to add greatly to the labors of mining. Notwithstanding this, the main haulage roads in the mines are graded almost everywhere to $1\frac{1}{2}$ per cent or less in favor of the loads. The grades in room entries cannot be eased enough to permit of haulage by gathering locomotives. In consequence, mules and ponies must be used. Where the grades are too steep even for animals, hoists are used for hauling coal from the faces to the necks of rooms.

WORKING AROUND SINKS AND RISES IN HEADINGS

Sometimes where room headings dip or rise excessively and have to be filled or excavated accordingly, a so-called "monkey breakthrough" is driven 80 ft. from and parallel with the heading so as to connect in coal the two rooms on either end of the fold. Rooms are worked from the monkey breakthrough, and the pillar between it and the heading is recovered by splitting it and drawing both wings on the retreat.

In some places, as in 30-G section of No. 30 mine, the shortwall mining machines are lowered down a dip by attaching a hoist rope and retarding its passage with the brake on the hoist and with that on the cutting machine also. In loading or unloading a machine from its truck on a rise or dip, frequently an extra machine jack must be fastened from the roof to the bottom in

front or behind the rear axle of the truck, as the case may be. Though the cutting machine will cut as well in these places as on the level there is no way of predicting the characteristic of the bottom under the next cut. In a distance equal to the length of the cutter bar of the machine a dip in the coal may change to a rise, or vice versa.

A study was made by the company in both mines to determine the quantity of slate that would have to be handled in mining a basic production of 120,474 tons of coal. This production was chosen because at the time the study was made it represented the average output per month of 26 days. Actual measurements of the thickness of coal and slate that had to be handled in advancing the faces were made in each room, air-course, pillar and heading. The average thickness of coal derived was 57.57 in. and that of the slate was 8.13 in.

As 1 cu.yd. of coal in the solid weighs 2,160 lb., to produce 120,474 tons of coal, 111,550 cu.yd. of solid coal would have to be mined. The thickness of the slate that would have to be handled in advancing the faces would be one-eighth that of the coal and consequently 15,755 cu.yd. of slate in the solid likewise would have to be handled in advancing the faces. This slate would fill 11,820 mine cars, figuring that 1 cu.yd. of slate in the solid is the equivalent of 2 cu.yd. of loose slate and that the volumetric capacity of the Lynch mine car is $2\frac{3}{4}$ cu.yd.

But after the faces were advanced, 18 per cent of the original quantity of slate additional would have to be handled and this would be sufficient to fill 2,066 mine cars. The total quantity of slate that would have to be handled would fill 13,886 mine cars. Slate from all mines which would have to be hauled to the tippie would fill 8,598 mine cars.

WEIGHT OF SLATE LOADED HALF THAT OF COAL

As the capacity of the mine car is 3 tons, the basic production of 120,474 tons would require the handling of 40,158 mine cars of coal. This means that for every 4.84 mine cars of coal one car of slate would have to be transported to the tippie and dumped. The specific gravity of the coal is 1.28, that of the slate is 2.80, consequently by weight little more than twice as much coal as slate is handled over the tippie. In the face of this big difficulty in mining, the average outputs per loader, per underground man and per man on the payroll are indeed high. These figures were given in the previous article.

Most of the slate that would have to be transported to the outside would come from haulage entries. In No. 30 mine that chargeable to haulage extension would be 2,355 cars and in No. 31 mine it would be 3,645 cars. To the former would be allocated a basic production of 79,374 tons of coal and to the latter 41,000 tons. In extending the haulage roads in No. 31 mine three times as much slate would be transported to the surface per ton of coal mined during the extension as for No. 30 mine. Incidentally twice as much coal would be mined during that period in No. 30 mine as in No. 31 mine. It may be noted that the rate of drilling by compressed air in slate and sandstone for grading haulage roads is 1 ft. in six minutes.

IF FRANCE WILL ONLY WAIT a little while the German offers will be offers to accept an indemnity.—*New York Tribune*.

Underground Transmission with Substations Designed To Keep Voltage Drop Low in Lynch Mines

A Mine Power Plant—How the Load Varies Throughout the Day—Supplying the Town With Lights and Power—Underground Distribution System in the Mines.

A MODERN power plant and an efficient system of electrification and power distribution are prerequisites of mining on a scale as large as that at the Lynch mine, a giant in the group of bituminous mines which are classed as big producers. The need for a modern power plant is redoubled in this case because the mine is isolated and out of range of central-station custom power, which otherwise might be depended upon to provide standby energy should the generating equipment be crippled at the mine. Under any circumstances it is always highly desirable that an efficient system of electrification be planned before a mine is opened up. The system should be flexible so as to permit additions and changes required in each stage of the development of the mine.

In many mines the electrification plan provides for the use of direct current only, which is not desirable from the standpoint of efficiency; nor is it favorable for extensions as the mining faces move further from the source of power.

Underground transforming and converting substations, supplemented by ample copper to feed the lines from which the power is drawn, will remedy the power troubles that vex the mine superintendent who relies solely upon direct current for his electrical energy. An adequate number of substations properly located with respect to the loads help to maintain excellent voltage in direct-current lines, thus making the system at the Lynch mine comparable to modern methods employed in a metropolitan central-station distribution system or

an electric-railway layout in a large, heavy-traffic city.

All particulars of the power plant at Lynch will not be recounted here for the reason that a general description has already appeared in these pages—see *Coal Age*, pages 453 and 454 in the issue of Sept. 22, 1921. In this article those details will be emphasized which deal with a few problems of installation, operation and maintenance of the power plant and the transmission system.

At the Lynch mines, steam at a pressure of 200 lb. and 100 deg. superheat is furnished by three 750-hp. Stirling water-tube boilers to two turbo-generators each rated at 1,875-kva. capacity, 6,600 volts, 3 phase, 60 cycles, and to the auxiliary steam equipment. The usual practice is to run two boilers at a time, holding one as a spare. The idle period of the latter affords an opportunity to make necessary repairs on it. In the course of a year all three boilers will have given about the same service, which is sufficient to necessitate a relining of each of the boiler furnaces once every ten months.

Peak loads on the plant now vary from 60 to 75 per cent of the normal rating of the two generators. It will not be long, however, until these peaks will approach the normal capacity of the generating equipment, at which time a third unit, for which space has been provided, will be installed. Though two of the boilers are sufficient to care for all the steam equipment at present, the three boilers now installed would not suffice for the addition of a third turbo-generator so also

Most Modern Boiler Room

Three Stirling water-tube boilers of 750-hp. capacity are fired by under-feed stokers. There is space for a fourth unit. Only two boilers are fired at one time. When the load on these boilers becomes too heavy to be carried by natural draft, a fuel economizer starts the forced draft; in fact, whatever equipment was deemed necessary to carry the plant load efficiently has been installed. Note the steam flowmeter on the right.

another boiler will be added. The necessity for excess boiler capacity at isolated plants which cannot be assisted from an outside source is obvious.

The boilers are carried at an average of 150 per cent rating for a period of 24 hours when a vacuum of 26.5 in. in the condensers can be maintained. Very seldom do they run at or below normal rating. During the day, from 6:30 a.m. until 4 p.m., they are fired to generate steam to the extent of 200 per cent of rating, while for the remaining hours of the day the load drops to 110 per cent of rating. During the latter period, when the load is light, one turbo-generator is idle. Whenever natural draft is insufficient to keep the boiler pressure at 200 lb., forced draft is started to maintain the plant efficiency as high as possible. Feed water comes from the water main of the town and requires no special treatment for boiler purposes.

Some difficulty has been encountered during the hot season of the year in maintaining a vacuum of 26.5 in.

The air washer consists of a centrifugal pump which forces water through spray jets to wash down the dust in the washing chamber. The air is forced against baffle plates which take out the moisture.

An interesting study was furnished by the chart of the kilowatt recorder taken at the plant on Aug. 11 for a period of twenty-four hours, tying in outside operations with those of underground and interpreting them accordingly. At midnight when the chart was started, the load varied but little from an average of 1,000 kw. until 2:30 a.m.; then it dropped off suddenly to a load slightly in excess of 800 kw., which was maintained until 5:30 a.m. The droop in the curve at 2:30 a.m. is natural. Coal cutters finish their cutting about this time, several locomotives used for hauling supplies, etc., are no longer running continuously and the machine shop, which is operated in two shifts, is closed at this hour. Street lighting, fans, pumps and other mine equipment constitute the load at this time.

**Power House
Switchboard**

The switchboard depicted above is located on the same level as the turbo-generators and is provided with complete control and metering equipment for each circuit.

**1,875-kva. Turbo-
Generator**

For the day load when the mines are working the two generators are operated; during the night and on Sundays one is sufficient to carry the load.

An Inside Substation

Each substation as shown above is housed in a concrete room near the load center. This arrangement makes possible proper voltage on all the feeder and trolley lines.

on the condensers. The water supply for condensing comes from the Big Looney Creek, which becomes low during the dry season. A spray pond which it was thought would adequately care for the needs of the power plant during low-water periods does not cool the water sufficiently for efficient condensing. Consequently a cooling tower is now being completed that will eliminate this trouble.

The air used for cooling the electric end of the turbo-generators is passed through an air washer. This is a particularly necessary precaution where the power plant is so close to the tippie. With a tippie of the size found at Lynch some coal dust is suspended in the air and finds its way into the generating equipment unless it is first removed. If the air were not washed, the capacity and efficiency of the generator would be reduced by a reduction in area of the air ducts and thus cause a rise in the temperature of the windings. Coal dust in the generator might be ignited by the slightest spark. With a generator revolving at 3,600 r.p.m. the rotor would coast for about twenty minutes after shutting off steam, with the result that in case of a fire in the generator it would be ruined before the fire could be extinguished.

From 5:30 to 6:30 a.m. the load hovered around 900 kw. Consequently one would surmise that the domestic load from the 998 houses inhabited by a population of 7,100 to be 100 kw. during this morning hour in which households prepare for the day. At 6:30 a.m. the load jumped to about 1,600 kw., which approximately was the integrated load for the day shift. The peak for the day was about 2,100 kw. At 4 p.m. the tippie stopped, though the operation of the mines continued and the load fell to 1,100 kw. The drop of 500 kw. from the average, however, cannot be attributed to the tippie alone. The mine locomotives begin to clean up their trips at about 3:30 p.m. and there is a gradual reduction of the load from this source until 5 p.m. It can be reasonably said that the tippie load is about 250 kw., including, of course, that power which is consumed in the two dumphouses. As the night shift came on and the machine runners began to cut their places the load rose to 1,300 kw., but gradually fell back again to about 1,100 kw. at midnight.

There are two individual 6,600-volt outgoing circuits from the power house for town use. One circuit supplies current for the houses only. The other circuit supplies

EXCITERS FOR TURBO-GENERATORS

current for business houses, the hospital, the office, schools, etc. The domestic and the business circuit are metered separately.

Outgoing lines from the power house pass through horn-gap switches on the hillside to transmission lines going to the upper and lower ends of the town. This precaution insures service to either end of the town in the event of trouble on the opposite end. Landslides, cold weather and lightning in mountainous districts are ever likely to cause trouble. Branch lines from the main transmission lines are stepped down to 110-220 volts. Branch lines and transformers are of a capacity and so distributed as to take care of individual sections of the town.

Three distribution circuits are used for the transmission of power from the power plant to the mines. All high-voltage transmission lines except those for town use are placed in underground conduits made of concrete. Each of the two mines has an individual circuit and so also has the electrically driven machinery on the surface. The last-mentioned circuit feeds the tippie, dumphouse, mine fans and shops, and on each tap from this circuit a separate meter is provided. The consumption of power in each mine also is metered separately. This arrangement distributes the cost of power in proportion to the amount used by each of the several phases of operation.

The circuit which feeds outside mine equipment is stepped down to 440 volts through five 200-kva. transformers located in the power plant. A bank of three of these transformers is connected in closed delta to feed the tippie, dumphouses and shops while the remaining two transformers are in open delta for the fans. The bus bars of each of these two banks of transformers may be interconnected through an oil switch so that in case of a breakdown to either set of transformers the fans may be operated. In that event, however, the tippie load would have to be decreased so as not to overload the working set of transformers—this arrangement has not yet been necessary. Con-

tinuous running of the fans is more important than tippie operation. The load on the tippie could be decreased by running one side and then the other alternately. A further reduction in the consumption of power in the tippie during such an emergency can be obtained by cutting out the grizzly screens and in the dumphouses by passing mine cars of slate through the dumps without dumping. This slate could be dumped at night.

From the busbars and oil switches the current is carried by a three-conductor braided rubber-covered cable of 000 wire to the floor and thence outside in metal conduits; there the wires enter 4-in. fiber conduit pipes of the drive-joint type which are embedded below the surface in concrete so that at least 3 in. of material protects the conduit pipe in any direction. In this manner the high-tension cables are extended to the substations in the mines, following the shortest paths possible, which are along the main haulage roads where they are placed below the level of the roadbed and near the rib on the trolley-wire side of the haulage entry. Wherever the mine track passes over the conduits, as, for instance, at a turnout, it is supported by extra heavy steel ties to prevent fracturing of the concrete.

At intervals of 500 ft., manholes fitted with covers provide facilities for laying the cable and furnish access for making repairs. The distance between manholes is made 500 ft. because the cable usually comes in 500-ft. lengths. Cables of this size in 1,000-ft. lengths are too heavy and bulky for handling underground. The reel upon which such a length is wound is so big as to be cumbersome and consequently could not be taken into the mines very easily. Moreover, it would be next to impossible to pull this cable through the conduit from manhole to manhole at intervals of 1,000 ft. Either the pull line might break or the insula-

OIL FILTER FOR LUBRICANT USED ON TURBO-GENERATORS

For efficient operation of the generators lubricating oil must be kept clean. Oil filters are indispensable in the power plant at the mine just as much as they are indispensable in the large central station.

tion might be injured. Even in pulling a 500-ft. length through a conduit the pull line broke on two occasions.

The pull line generally used is a $\frac{1}{2}$ -in. stranded wire rope of steel. As the conduits are laid, an auxiliary pull line of No. 12 galvanized iron wire is first put through from one manhole to the next. This preparatory precaution is taken because it was soon found that much trouble is met in pushing a small wire through the conduit for distances greater than 200 ft.

By resorting to the method described neither cable nor conduit is in any way injured. This is important, for if the conduit were injured a leak would develop, as a result of which water probably would flow into the conduit and cause the cable to break down.

As a precaution all joints of the fiber conduit pipes are dipped in tar before being driven together. Also great care is taken in laying the pipes and in placing the protective covering of concrete to insure a straight level or uniformly graded line between manholes and thus eliminate damage due to water which would follow at those points where water might collect in the conduit. Wherever there is a suspicion that a given section of the conduit is punctured, a piece of brattice cloth saturated with hot tar is wrapped around the concrete at the point where the leak is believed to exist. Leaks in manholes are stopped off with concrete and painted with tar on the inside. In rare instances a manhole is inundated and then a portable pump is utilized to remove the water. Manholes on the outside between the power plant and the mine openings are provided with drain pipes which lead to the creek.

Naturally in every manhole the cable is spliced. The commonly used splice was tried but did not give satisfactory service. The method of the telephone companies, whereby individual wires are dipped in paraffin to waterproof the insulation along the entire length of the wire and at splices, suggested the use of paraffin for splices in high-tension cable. The outside cover at the end of one piece of the cable is slit so as to envelop the conductors exposed in splicing and also several inches of the insulation on the mating piece of cable. Each conductor is taped in the customary manner, first with rubber tape and then with friction tape. The separating strands of hemp are carefully adjusted in place at the splice. The slit in the outside cover at the end of one piece of cable enveloping the splice forms a

AIR WHICH COOLS GENERATORS WASHED WITH WATER

Equally as important as the filtering of the lubricant is the washing of the air which cools the generators. The air washer is located directly below the gallery on which the turbo-generators are set.

cup into which is poured a copious amount of boiling paraffin. The envelope is then closed and encircled with friction tape, after which the outside is coated with paraffin.

Not a single splice of this kind has failed though the cables have been extended a lineal length of 15,000 ft. and many of these are known to have been submerged in water for periods of many hours without leaking.

The high-tension cable is laid under the floor of the substations and led to the busbars in metal conduits. From busbars and oil switches the alternating current is stepped down through banks of three transformers, each transformer having a capacity of 75 kva., to 103 and 206 volts. Synchronous converters, each with a capacity of 200 kw., are used to generate direct current at 275 volts.

Each mine has two substations, averaging $1\frac{1}{2}$ miles apart. In each mine the innermost substation is equipped with only one converter whereas the outermost substation has two. In the substation equipped with two

MANHOLE FOR ACCESS TO HIGH-TENSION CONDUIT

The manholes must be made waterproof as well as the conduit which stretches between them. A splice of the cable can be seen. The cover consists of $\frac{3}{4}$ -in. steel plate.

converters—generally termed No. 1—connection is made from the A.C. busbars through current transformers to three oil switches, two for the two converters in this substation and one for the single converter in No. 2 substation. In case of trouble in No. 1 substation the oil switches which control the current to converters in No. 1 substation are tripped open and No. 2 substation is unaffected. Of course the two substations are connected in parallel on the direct-current end to equalize the load between the two substations.

No. 2 substation in No. 30 mine is temporary. A new substation to take the place of the temporary substation is being built 5,000 ft. in by from the latter. This will make an interval of two miles between the two permanent substations in this mine. Housed by the same walls as those that form the substation will be a mine foreman's office and an underground restaurant. The latter is an innovation in mines and will be equipped with an electric range on which hot lunches will be prepared.

Feeders of 1,000,000-circ.mil. cross-section are carried from the substations along the main haulage roads of the mine. From them run 500,000 circ.mil. feeders along the main haulage road in each mine section. All feed cables are carried on the same hangers that hold the trolley wire. This arrangement is advantageous

AUTOMATIC RECLOSING CIRCUIT BREAKER IN NO. 31 MINE

This breaker is located at No. 1 flat right off No. 31 main taking care of an electrical section in which are included three adjoining flats to the right of the main heading. The breaker is set for 700 amp., that in the substation is set at 1,200 amp. A short in this section will not affect any other section; and when the short is removed the breaker will close automatically.

for several reasons: A feeder is not likely to be cut in two by a derailed locomotive or by a wreck of mine cars as would be the case were it hung from the rib; it is safer being up with the trolley wire and it simplifies the task of suspending it as one hanger serves for both feeder and trolley wire.

Strain insulators are placed on the feeders at intervals of 500 ft. Jumpers from feeders to trolley wire are spaced on 200-ft. centers to insure a minimum voltage drop when locomotives in a given section are taking a full load. Localized heating of the trolley wire, with subsequent elongation which causes it to drop, is prevented.

MINIMUM OF LINE LOSSES ASSURED

In these mines high-tension alternating-current distribution in underground conduits at 6,600 volts to all underground substations insures a minimum of line losses. Because large feeders are along all main haulageways it is rare to have a voltage drop of more than 15 volts at any face in any section at the present stage of development in both mines. It is the intention of the company never to have a drop of more than 75 volts; even when the workings are moved far under the mountains, more substations and feeders will be added to maintain a high direct-current voltage at all places.

Damp Carbide from Acetylene Lamp Ignites Coal Dust Warmed by Sun

BY ROYCE L. GRIMES

Electrical Engineer, Cleveland, Ohio

EVERYONE engaged in the mining industry knows that carbide generates great heat when it is dampened, but few indeed have suspected that it could attain such a temperature as to ignite dust from the average grade of soft coal.

Recently I passed by one of the tipples of a mining company located in Jefferson County, Ohio, and noticed that smoke was escaping from a pile of dust that had accumulated under the screens. It was during the noon hour, and the place was deserted except for the foreman of the tipple, the weighmaster and myself, so we proceeded to extinguish the flames. Upon examination of the dust as it was shoveled into the open we discovered small fragments of carbide, and upon further inquiry we were informed that an employee from the inside of the mine had passed this platform and emptied the contents of his lamp only about five minutes prior to my discovery of the fire. This we conceived to be a possible clue to the source of the fire, and I gathered a quantity of dust that was unburned and delivered it to the laboratory.

The analysis was as follows: Volatile matter, 36.81 per cent; carbon, 52.03; ash, 11.16; the sulphur percentage was 2.10 and the heat of complete combustion 14,500 B.t.u.

A quantity was placed in a suitable test tube and a fragment of damp carbide added. The tube then was sealed, but no apparent action took place other than the formation of gas from the carbide. A second quantity was prepared in a similar manner except that it was preheated to about 122 deg. F., which is about the temperature to which the dust upon the tipple was exposed for the rays of a summer sun at midday were beating upon it. To this warm coal a fragment of damp carbide was added. This test resulted in ignition within 4.5 seconds.

The tests that followed were many and varied but we learned through a series of experiments that from 4.5 seconds to approximately 40 minutes might be required to ignite this dust, the time depending upon temperature, quantity of dust and carbide, the atmosphere and other conditions. I hope to gather more data pertaining to this matter. Until more is discovered, however, it is well to keep in mind the possibility that loss of life, destruction of property and loss of employment may result from the careless disposal of used or partly used carbide.

Railroad Coal Consumption Up in July

Class 1 railroads of the United States consumed 8,315,000 net tons of coal during July, 1923, as charged to account 394, compared with 8,296,000 tons in the preceding month and 6,597,000 in July, 1922, according to a report by the Bureau of Statistics of the Interstate Commerce Commission covering 176 steam roads. During the first seven months of 1923 these roads consumed 65,226,000 tons as compared with 51,736,000 tons in the corresponding period of 1922. The delivered cost per ton in June last was \$3.37; in July, 1922, it was \$4.32.

Consumption of fuel oil during July was 160,270,000 gallons, compared with 151,732,000 gallons in June and 120,809,000 gallons in July, 1922. The totals for the first seven months of 1923 and 1922 were 1,056,972,000 and 833,926,000 gallons respectively.

New Equipment

Two-Piece Chain That Does Not Buckle Or Come Apart in Service

A NEW two-piece chain suitable for elevators, conveyors, concrete mixers, stokers, ash conveyors, portable loaders and power transmission in general, suitable for operation on any standard sprocket from 1 in. pitch up, developed and placed on the market by the Anthracite Chain Co., Hazleton, Pa., is now being applied extensively at the coal mines.

This type of chain has no loose pins, the center links and pins being made up of one forging. This arrange-

FIG. 1—CHAIN ASSEMBLED

Reducing the number of parts and still maintaining the serviceability and strength of the chain is a very important consideration in chain design. This chain seems to have all the desirable features and none of the objectionable features which are always troublesome.

ment reinforces the bearing surface of the pins and side links and also increases the diameter of the pins.

The development of this chain has been the result of a need for a stronger and more efficient chain with fewer parts than most of the earlier chains that were developed for service around the mine. The parts are made from high carbon steel drop forged and the chain is now made in pitches from 3 in. light to 9 in. heavy. This embraces eight different sizes.

Fig. 1 shows the chain assembled. It will be noted that the pins fit the side links in a way that forms a semi-ball and socket joint. This prevents side play, eliminating any possibility of climbing the sprocket. The ends of the center links that come in contact with the sprocket teeth are extra heavy to retain the pitch of the chain.

Fig. 2 illustrates how the chain is assembled. When in service only one-half of the pitch is required for slack

FIG. 2—HOW CHAIN IS ASSEMBLED

These links can be taken apart instantly without removing attachments, yet it is impossible for the chain to buckle or come apart in service.

to take the chain apart. Where it is necessary to reverse or back up the line, the stops and the back of the pins come in contact with the extreme ends of the side links and prevent back lash.

The attachments for the flights, carriers or buckets are made of certified malleable iron parts which grip the center link and are interchangeable with standard flights. The attachment bolt passes through the half circle in the center link thus preventing any slippage.

This chain has already been examined and approved by the Industrial Board of the Pennsylvania Department of Labor and Industry.

Single-Stage Double-Suction Centrifugal Pump Maintains High Efficiency

AFTER a careful survey of the latest technical data available, embodying a study of the practice of all manufacturers of centrifugal pumps both in this country and abroad, the Goulds Manufacturing Co., of Seneca Falls, N. Y., has developed a new line of single-stage double-suction centrifugal pumps. The main features of these new pumps are mechanical durability and maintained high efficiency.

The impeller is of the double-suction inclosed type. For bronze fitted pumps removable bronze shaft sleeves are provided to protect the shaft from wear and corrosion. The casing is horizontally split, making it possible for the pump to be opened for inspection without disconnecting either the suction or discharge piping.

NEW TYPE SINGLE-STAGE DOUBLE-SUCTION CENTRIFUGAL PUMP

Heavy construction, low maintenance, long life and maintained high efficiency, features always interesting to the mine manager, are claimed for this equipment.

The bearing housing is cast integral with the casing, which insures permanent alignment. Deep stuffing boxes fitted with split glands with swing bolts are furnished. The bearings are made of removable split ring oiling shells in a split housing. Any end thrust is taken up by a double-acting ball thrust bearing in oil bath.

The construction of the pump as a whole is substantial in every detail, the pump casing in particular being suitable for heavy suction pressures as high as 100 lb. Suitable bases can be made for mounting the pump as a unit in conjunction with an electric motor, steam turbine, gasoline engine or belt drive.

The various sizes available will make this type of pump popular for use in the mines and outside the mines wherever water must be handled in large or small quantities.

Problems of Operating Men

Edited by
James T. Beard

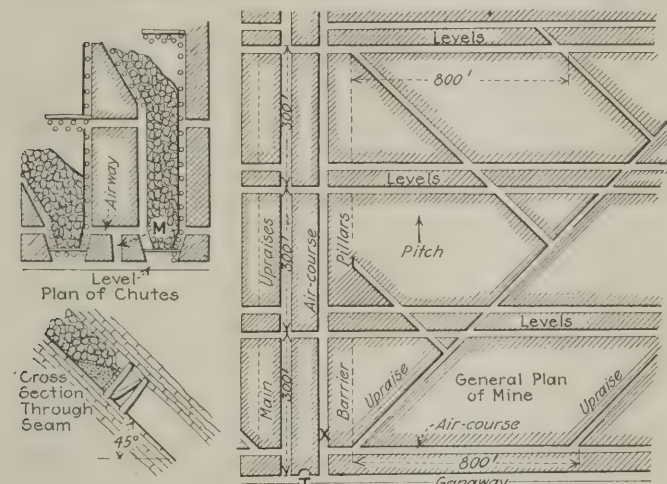

Working Two Coal Seams on Steep Pitches

Seams Reached by Cross-Tunnel—Gangways and Levels to Right and Left of Main Upraises—Slant Roads Pitching 35 Deg. Provide Conveyor System

HAVING had some experience in mining pitching seams, my attention was attracted by the inquiry of L. L. Travis, Ophir, Utah, *Coal Age*, June 7, p. 942, asking for the best method of working two steeply pitching seams, separated by 125 ft. of strata and having an inclination of 45 deg., approximately.

Assuming that the only way of approaching the seam is by driving the proposed tunnel from the hanging-wall side, and that the line of the tunnel is located near the center of the property, I would adopt a plan of development similar to one that I will try to describe.

Where the tunnel cuts the upper seam, marked T in the accompanying figure, I would start and drive

SHOWING GENERAL PLAN AND DETAIL SECTION

a pair of upraises on the full pitch of the seam, extending these openings to the surface. This work should be rushed so as to provide an adequate air-course for the further development of the mine. The two openings should be driven on centers determined by the depth of cover and other conditions relating to the nature of the roof, floor and coal.

Mr. Travis states that he contemplates the probable total extraction of one of the seams before developing the other. Let me suggest that the development of the second seam should commence when the output of the first has reached its peak. The total production from the property would thus be maintained more uniform, and the development of the second seam would probably be more easily financed.

If this suggestion is adopted and an air-course driven to the surface on the second seam, a drift can then

be driven from one of the main upraises on the first seam to the air-course of the second seam, as indicated at X in the general plan on the right of the figure. This would provide means of properly ventilating the first seam, when the barrier pillars of the upper air-course are being extracted.

The correspondent's suggestion of driving levels each way to the property lines, and upraises every 800 ft. is good and, as the editor has remarked, "cannot be improved." Then driving levels every 300 ft. from the main upraises will divide the whole property into blocks or panels 300x800 ft. in area. The upraises, however, must be driven in such a direction so as to give a maximum inclination of 35 deg. and enable the use of retarding conveyors.

ROOM-AND-PILLAR WORK, RETREATING PLAN

When the property has been developed to the crop and boundary lines the final operation of robbing back is commenced, for which a modified form of longwall retreating has been suggested. My fear is, however, that such a plan would prove a costly experiment in this case. Instead, allow me to suggest the room-and-pillar method of extraction, in retreating.

The rooms should be driven on the full pitch of the seam. The width of both rooms and pillars must be determined by the depth of cover and other conditions that characterize the seam. The room chutes should be kept full, until the room has reached its limit of 300 ft. The coal in the chute is then lowered enough to enable the miner to angle into the adjoining pillar as shown on the left of the figure. The angle will be determined by the nature of the roof strata overlying the seam.

As each slice of pillar is extracted and the coal lowered ready for another slice of pillar, a bulkhead (a cross-section, of which is shown in the lower left-hand of the figure) is built to protect the chute below. These bulkheads, cushioned with slack, as indicated in the figure, prove very effective in comparatively low seams, as we may class the two seams, in this instance.

The bottom slice of pillar may be cleaned out by building a loading chute in the manway M, between two adjoining rooms. The method of robbing the entry stumps would be the usual method, familiar to miners, in pitching seams. By this method a good percentage of extraction may be obtained. Manway lumber can be easily recovered, and if good bulkheads are built at the proper time, most of the props can be recovered.

TRANSPORTATION OF COAL

The inclination of 45 deg., in this case, insures the gravitation of the coal down the pitch and the only problem is its transportation along the levels. I would suggest utilizing the energy generated on the pitch to transport the coal along the levels. One of the leading manufacturers of conveyors states, "Retarding con-

veyors operating on inclinations above 26 deg. will generate power"; and, again, we are advised that "an inclination of 35 deg. is the maximum inclination for retarding conveyors."

Retarding conveyors can therefore be installed in the slant upraises, their number depending on the production of the mine. Each conveyor should be made in sections, so that when the level has retreated to the conveyor upraise a section can be taken out and installed in the level below. The coal from the higher level must then be taken to the next conveyor on the outbye side.

CONVEYOR SYSTEM GENERATES POWER

In order to utilize the power generated by the conveyors I would suggest coupling each conveyor to a small dynamo. Since the periods of generating will be intermittent, the current must be transmitted to accumulators, and there, in turn, tapped by feed lines, to transmit the power to where it may be needed.

On the levels, the coal is conveyed from the room chutes, in bottom-dump cars, and dumped into chutes feeding the conveyors.

For transporting the coal along the levels in as simple a manner as possible, hand tramming not being efficient, I would employ an electrically operated endless-rope system, provided the mine is non-gaseous; or compressed air can be used if the mine is gaseous.

CYMRO.

Flooding of Mine Prevented by Changing Course of Creek

Door at foot of slope good for use in emergency—Permanent benefit obtained by changing the course of the creek—Instance cited.

REFERRING to the inquiry of Joseph Magdalena, which appears in *Coal Age*, Aug. 23, p. 291, and describes the trouble he has experienced with the flooding of his mine during the wet season, or at the time of a Spring freshet, kindly permit me to offer a suggestion that may be of service in his case, particularly if the mine underlies a creek bottom, as has been my own experience.

The suggestion he offers of building a strong iron door at the foot of the slope, on finding that the concrete wall and arch with which he lined the slope failed to keep the water out, is undoubtedly a good plan for use in an emergency. There are reasons, however, why something else should be done that will afford greater relief, by not interrupting the mining of coal during times when the door would have to be closed.

For this reason, I would look for some other means of keeping the water from running into the mine. It is possible, as I have already suggested, that this mine underlies a creek bottom; and, in that case, the accumulation of surface water in that area and the possible overflowing of the creek will make it difficult to keep the water from flowing into the mine through cracks and crevices in the overlying strata.

On this assumption, allow me to suggest as a remedy changing the course of the creek, should that be possible, so as to avoid its traversing the section immediately above the mine workings. This was done, in one instance I recall, and there was no further trouble from that source during the working of the mine. When the place was finally abandoned the creek was turned back into its old course.

It may happen that much benefit will be derived by building a levee to divert the course of the water, and lining the creek bottom with a good layer of concrete. It may be necessary to widen the bed of the creek to prevent overflowing the banks during a freshet.

Loogootee, Ind.

JACOB RILEY.

Official Responsibility for Mine Explosions

Improved mining laws not the most urgent factor in reducing the number of mine explosions—Enforcement of existing laws of still greater importance.

THE terribly fatal mine explosion at Kemmerer, Wyo., which occurred Aug. 14, a brief account of which is given in *Coal Age*, Aug. 23, p. 296, again calls attention to the question of doing what we can to reduce the number of these dread disasters. The Kemmerer explosion exacted a toll of 99 lives and would seem to have been preventable by more careful supervision.

I am reminded of an excellent article that appeared in *Coal Age*, some time since (Vol. 23, p. 302), in which my friend, C. W. Atkins, asked the question, "In what respect can our state mining laws be improved?" His letter impressed me, at the time, as being one of the best that have been written on this subject.

While there is no doubt in my mind but that our mining laws can be improved in many respects, I am convinced that that is not the most important factor in reference to reducing the number of explosions in the mines. One point that occurs to me just now is that clause, in Art. 4, Sec. 1, of the Bituminous Mining law of Pennsylvania, which makes the mine foreman, in the words of the law, "subject to the supervision and control of the operator."

OPERATOR MUST CONTROL HIS OWN PROPERTY

Without doubt an operator should rightfully be in control of the mine, which is his property, to the extent of employing a competent foreman whom he can trust to take charge of its operation in respect to safety. On the other hand, however, the man so placed in charge and made responsible for the safe conduct of operations underground must be free to follow his own judgment and experience, since he is the one in closest touch with conditions affecting the safety and lives of the men in his charge.

To divide this grave responsibility in respect to safety, between the foreman in charge underground and the operator or superintendent on the surface, is to my mind one of the mistakes in our present laws. In this and a few other respects, our laws can doubtless be improved; but I wish to draw attention to a still more important factor in the preventing of explosions in our mines.

We all know and realize that what improvements have already been made in our mining laws have proved to be a great benefit in reducing the number of mine accidents, wherever these laws have been enforced by the mine officials in charge. None of us can say, however, how much greater would have been the benefit derived from this source had these laws been enforced more universally and there had been greater co-operation in that respect between all mine officials in charge of operations above and below ground.

As illustrating this point, I recall an instance that occurred when I was working in a mine so gaseous that no open lights were permitted in the drift mouth. However, so lax were the restrictions placed on the under-

ground operations, in that mine, that the miners charged and fired their own shots. To cap the climax, the firebosses employed in the mine had their attention called, by the management, to the fact that they were reporting too much gas.

Actions of this kind or of a similar nature are more often the underlying causes of explosions in mines than may be generally imagined. That is my reason for urging, as a truth to be recognized, that the strict enforcement of existing laws now on our statute books is of greater importance than the framing of new laws if we would reduce to a minimum the liability to gas and dust explosions in the mines.

It may seem unreasonably drastic to suggest that an extreme penalty, similar to the penalties attached to

the taking of life by assault and battery, be exacted of mine officials holding responsible positions when the failure on the part of such an official results in the loss of life to mine workers entrusted to their care. It is my belief, however, that such drastic penalties would have a wonderful effect in changing the attitude of many higher officials, in reference to the safety of their employees.

One word more in closing. It is my belief that mine explosions can be almost wholly eliminated through the honest and hearty co-operation of all mine officials, in seeing that the mine is operated in strict compliance with the requirements of the mining law. If mine officials cannot stamp out this evil, let me ask, Who can?

Inquiries Of General Interest

Reducing Resistance to Flow of Air in Fan Shaft

Obstruction Offered by Sharp Bends in Air-Course Not to Be Disregarded—Estimate of the Percentage of Loss on This Account

WE ARE about completing a new air shaft for the better ventilation of our mine. The fan to be installed is a double-inlet, reversible fan of the turbine type, 7 ft. in diameter and 4 ft. wide. At a speed of, approximately, 320 r.p.m., this fan is guaranteed to produce 200,000 cu.ft. of air per minute, against a total water gage of 4 in. The fan will be operated as an exhaust fan.

The fan shaft, which is 10x12 ft. in section, has been lined with an 18-in. concrete wall, extending from the bottom to the top of the shaft. About 15 ft. below the surface, a quicksand formation was encountered; and it was thought best to strengthen the concrete lining of the shaft, at this point, by the use of seven 40-lb. steel rails. These were placed across the shaft, four rails across the width and three across the length of the shaft, spacing them about equal distances apart.

In regard to these rails, the question has arisen, in the minds of some of our officials, as to whether this arrangement will cause an eddy and obstruct the flow of the air passing up the shaft. On this point, I should be glad to have the opinion of *Coal Age*.

Also, both our engineers and the maker of the fan advise me that a considerable gain in the efficiency of the ventilating system would be secured by rounding the airway or passage at the foot of the shaft, in the manner shown in the accompanying sketch. This would conduct the air current in a continuous curve, instead of causing it to abut sharply against the con-

CURVING SHAFT BOTTOM

crete wall at the bottom of the shaft, as it must do unless this change is made. I want to ask, will the striking of the air current against the concrete wall, in the present arrangement, cause any appreciable eddy or disturbance of the air passing up the shaft?

Blairsville, Pa.

MANAGER.

In answer to the first question asked by this correspondent, regarding the obstruction offered by the rails placed across the shaft about 15 ft. below the surface, as he has described, there is no cause for worry on this account. Estimating on a maximum air current of 200,000 cu.ft. per min., the velocity of the air is not excessive, being only 1,650 ft. per min. Even allowing for the reduction of the area of the shaft by the presence of the rails, the velocity of the air would be increased to 2,000 ft. per min. for an inappreciable distance only. If the rails are equally spaced in the shaft, there will be little or no eddy in the air current at this point.

ESTIMATING LOSS DUE TO SHARP BENDS

In regard to rounding the air passage at the foot of the shaft, however, a very considerable benefit will be derived by so doing, if this is done in a workmanlike manner. In replying to a previous inquiry regarding the resistance offered by sharp bends in an air-course, *Coal Age*, July 19, p. 111, reference was made to the investigation of this subject, by the Engineering Department of the University of Illinois co-operating with the Federal Bureau of Mines. The investigation showed that a sharp turn of 90 deg., or a right-angle deflection in an air-course, caused a theoretical loss in pressure equal to twice the velocity head of the current, whereas the same deflection, through a gradual curve, gave no appreciable loss.

Estimating on this basis and assuming an air current of 200,000 cu.ft. per min., passing in a 10x12-ft. airway or shaft, causing a velocity of, say 27.78 ft. per sec., the velocity head, expressed in inches of water gage, is $0.0144(27.78^2 \div 64.32) = 0.173$ in. Then, if the loss due to a square 90-deg. turn in the air-course is twice this velocity head, it would cause an increase of water gage of $2 \times 0.173 = 0.346$ or, say $\frac{1}{3}$ in.

Finally, estimating on a 4-in. water gage developed in the fan drift, the right-angle turn, at the foot of this upcast shaft, represents a loss of one-twelfth, or $8\frac{1}{3}$ per cent, making the power available for the circulation of air in the mine about $91\frac{2}{3}$ per cent of that indicated by the reading of the gage in the fan drift. This result is seldom appreciated in practical mine ventilation.

Examination Questions Answered

First-Class Foremen's Examination, Birmingham, Ala., July 23, 1923

(Selected Questions)

QUESTION—Which would you prefer in building airtight or fireproof stoppings; stone, brick, concrete, or hollow tile? Explain fully, stating the cheapest.

ANSWER—Each kind of material mentioned is fireproof and can be made airtight if carefully built as a mine stopping. The choice of material may depend, to some extent, on conditions in the mine in regard to the economy of construction. For example, a mine may furnish a large quantity of good rock for building stoppings, which if not so used would have to be stowed away as refuse or sent out of the mine. In that case, it would be economy to build good rock stoppings. In the absence of rock, however, the choice will generally lie between concrete and brick; and the former will most commonly be chosen, because of its general utility for the purpose. Hollow tile, unless of a form specially adapted for use in the mine, will seldom possess the required strength to withstand the roof pressure, particularly where there is any liability to squeeze, although the work of building stoppings with either hollow tile or brick may be more easily performed than when rock or concrete is employed.

QUESTION—Why should an up-to-date blueprint copy of the mine map always be on hand in the mine foreman's office; and what ready information will this furnish?

ANSWER—An up-to-date blueprint copy of the mine map will show, at a glance, the relation of different sections of the mine, and enable the foreman to plan the work intelligently. Constant reference to the map will avoid the habit of many mine foremen, who are prone to assume that their familiarity with the mine enables them to judge correctly of the direction and distance of driving certain rooms and entries. Mistakes made in this way often result in the loss of much coal that can never be recovered. Again, in case of accident in the mine, when rescue teams and helpers come from other mines and districts, an accurate mine map is invaluable in directing the rescue work that follows.

QUESTION—A water gage reads $2\frac{1}{2}$ in., on a door 5×7 ft.; what is the total pressure on the door? Show by example.

ANSWER—A water-gage reading of $2\frac{1}{2}$ in. corresponds to a pressure of $2\frac{1}{2} \times 5.2 = 13$ lb. per sq.ft. The area of the door is $5 \times 7 = 35$ sq.ft., which makes the total pressure, in this case, $13 \times 35 = 455$ lb.

QUESTION—What degree or percentage of pitch forms the most ideal condition for chutes?

ANSWER—The answer to this question will depend largely on the character of the floor of the seam and the nature of the coal, as these factors determine the ease with which the coal will slide down the chute. In general, however, it may be stated that where the inclination of the seam is less than 30 deg., it will be necessary to line the floor of the chute with sheet iron,

to enable the coal to slide freely. Coal that is hard and dry will slide easily over a sheet-iron floor, until the inclination gets as low as 15 deg. When the inclination reaches 30 deg., there is generally no trouble experienced in the sliding of the coal.

QUESTION—Which would you prefer, an airway 6×12 ft. or one 8×9 ft., in section? Give reasons.

ANSWER—Since both of these cross-sections show an area of 72 sq.ft., the one having the shortest perimeter, which is the 8×9 -ft. airway, will have the least amount of rubbing surface, for the same length of air-course. This airway will, therefore, present less resistance to the passage of the air current, other things being equal, and is the section to be preferred, as far as ventilation is concerned. There may be other considerations, however, that would alter this choice.

QUESTION—The velocity of an air current is 578 ft. per min. In an airway 6 ft. 8 in. high and 7 ft. 6 in. wide; what quantity of air is passing per minute? Show the calculation.

ANSWER—The sectional area of this airway is $6\frac{2}{3} \times 7\frac{1}{2} = 50$ sq.ft. Assuming the given velocity is an average for the entire section of the airway, the quantity of air passing is $50 \times 578 = 28,900$ cu.ft. per min.

QUESTION—In a ditch 18 in. wide and 12 in. deep, the velocity of the water is 5 ft. per min. How many gallons of water will pass in one hour? Show example.

ANSWER—The sectional area of this ditch is $12 \times 18 = 216$ sq.in. or 1.5 sq.ft. Then, assuming an average velocity of 5 ft. or 60 in. per min., the quantity of water flowing in this ditch, in one hour, is $(60 \times 60 \times 216) \div 231 = 3,366$ gal.

QUESTION—What percentage of stone dust would you recommend to render coal dust non-explosive?

ANSWER—Experiments by the Federal Bureau of Mines, on the fine dust of Pittsburgh coal have shown that a mixture containing 60 per cent of fine shale dust (free from combustible matter) or 60 per cent of limestone dust, prevented the ignition of the mixed dust, by a blowout shot. On the other hand, it was found that 75 per cent of either of these kinds of dust was required to prevent the propagation of an explosion that was once started. It is evident that very much depends on the inflammability of the coal, the fineness of the coal dust and whether or not the stone dust contains any appreciable combustible matter.

QUESTION—Where should stone-dust barriers be placed in a mine, assuming all entries working?

ANSWER—What is known as the "box barrier," in stone dusting, is a frail box filled with fine stone dust that will be blown into the air when the box containing it is broken by the force of the blast or concussion of the air, preceding the flame of the explosion. These box barriers are placed at the entrance of all splits in the mine and at intervals of 1,000 ft. or more, on all entries where coal dust is found in quantities that may prove dangerous.

CORRECTION

Attention is called to an error that occurred in finding the angle whose cosine is 0.1, in determining the bearing of a slant road having a grade of 10 per cent, in a seam whose inclination is 45 deg., *Coal Age*, Aug. 30, p. 328. The required angle whose tangent is 0.1 is $84^{\circ}15'$, instead of $89^{\circ}25'$, and the required bearing of the slant road N $84^{\circ}15'$ E, the road making an angle of $5^{\circ}45'$ with the strike of the seam.

56,000,000 Tons of Soft Coal in Storage Piles Sept. 1; Exceeded Only Twice in Last Seven Years

Consumers of soft coal continued to add to their storage piles during August and on Sept. 1, 1923, they had on hand approximately 56,000,000 net tons, according to a survey by the Bureau of the Census and the Geological Survey, under authority of the Federal Fuel Distributor. This estimate takes no account of the coal in the cellars of householders, concerning which no statistics are available, nor steamship fuel, nor coal on the Lake docks, which item is classed as coal in transit. The passing of August, 1923, brought to a close a year of practically uninterrupted accumulation of stocks, and the stock-taking as of Sept. 1 revealed many interesting and important facts: Stocks on that date were 4,000,000 tons larger than on Aug. 1, 1923; 7,500,000 tons larger than on Nov. 1, 1921, and nearly 300 per cent larger than on Sept. 1, 1922; the course of stocks has been constantly upward during the past 12 months, except during February; during the 7 years for which records of stocks exist, the present supply has been exceeded only during the periods at the close of the war and just prior to the miners' strike of 1922.

Measured in terms of tons, stocks increased 7.7 per cent in August. Measured in terms of days' supply, the increase was 4.5 per cent. The smaller increase in days' supply is accounted for by the fact that the rate of coal consumption increased in August, thereby shortening the time that the available tonnage would last. At the rate of consumption during August the stocks on Sept. 1 were sufficient to last 46 days on the average, against a 44 days' supply on Aug. 1, at the rate of consumption in July. These averages are based on the assumption that the supply was evenly distributed.

In addition to the quantity estimated as being in the storage piles of actual consumers, the following quantities are known to have been in transit on Sept. 1: On the docks of Lakes Superior and Michigan, 6,400,000 tons; in

FIG. 2—DAYS' SUPPLY HELD BY DIFFERENT CLASSES OF CONSUMERS, SEPT. 1, 1923, AND NOV. 1, 1921

At the rate soft coal was burned in August, 1923, the total stocks on Sept. 1 were sufficient to last 46 days, an increase of 2 days over the supply on Aug. 1. The stocks on Nov. 1, 1921, were sufficient to last 43 days at the low rate of consumption then prevailing. Consumption in August was larger than in July, 1923, and further changes in the rate of consumption will be reflected in the days' supply.

storage at the mines, 440,000 tons; in cars awaiting dumping at lower Lake Erie ports, 625,000 tons.

The information shown graphically in Fig. 1 indicates that never before in the period over which reports on stocks extend, have consumers been so well supplied at this season of the year, except in the fall of 1918. The supply on Sept. 1, 1923, however, was more adequate than that on Armistice Day, because the present rate of consumption is less than during the latter part of 1918.

Estimates based on the reports from consumers and supplemented by information from other sources, indicate a total consumption in August of approximately 43,000,000 tons, or at the rate of about 9,700,000 tons per 7-day week.

Fig. 2, which is based upon the data in the table below, compares the days' supply held by the 7 principal classes of consumers on Sept. 1, 1923, with that on Nov. 1, 1921. In comparing figures of stocks on those dates two facts should be remembered; first, that while the actual tons of coal held by many of the consumers on Nov. 1, 1921, was much less than on Sept. 1, 1923, the days' supply on the earlier date was the larger, owing to the greatly reduced rate of consumption then prevailing, and second, that the two dates do not exactly correspond. A supply that had appeared amply sufficient to fill all needs on Sept. 1 might not be at all adequate two months later in the season. The average stocks on Sept. 1 were sufficient to last 46 days at the rate of consumption in August, against 44 days' supply on Aug. 1, 1923, 43 days on Nov. 1, 1921, and 42 days on Jan. 1, 1919, at the rates of consumption prevailing on those dates. Any appreciable change in the consumption rate in September will be reflected in the days' supply.

These statistics, shown by classes of consumers in Fig. 2

FIG. 1—TOTAL COMMERCIAL STOCKS OF BITUMINOUS COAL, OCT. 1, 1916, TO SEPT. 1, 1923

Figures represent million net tons and include coal in the hands of railroads, industrial consumers, public utilities, and retail dealers. Coal for steamship fuel, on Lake docks, in transit, and in the bins of householders is not included.

DAYS' SUPPLY OF BITUMINOUS COAL IN HANDS OF VARIOUS CLASSES OF CONSUMERS, JAN. 1, 1919, TO SEPT. 1, 1923 (a)											
(Figures represent number of days supply would last at current rate of consumption at time of stock-taking.)											
	Nov. 1, 1918	Jan. 1, 1919	Jan. 1, 1921	Aug. 1, 1921	Nov. 1, 1921	Jan. 1, 1922	Sept. 1, 1922	Jan. 1, 1923	June 1, 1923	July 1, 1923	Sept. 1, 1923(b)
Byproduct coke plants.....	35	32	29	31	38	42	11	19	23	26	30
Steel plants.....	45	42	42	46	46	48	12	27	29	35	33
Other industrials.....	71	65	64	56	67	51	32	40	39	46	56
Coal-gas plants.....	85	81	55	79	87	89	34	60	75	89	110
Electric utilities.....	49	49	44	44	54	51	26	33	45	48	52
Coal dealers, bituminous.....	37	39	30	42	46	33	11	16	27	39	38
Railroads.....	31	32	23	32	31	35	13	16	21	28	44
Total bituminous.....	45	42	39	39	43	41	17	26	30	37	46

(a) The figures in this table are estimates based on incomplete data. (b) The rate of consumption used in calculating the days' supply on Sept. 1, 1923, was the quantity consumed in August. (c) Subject to revision.

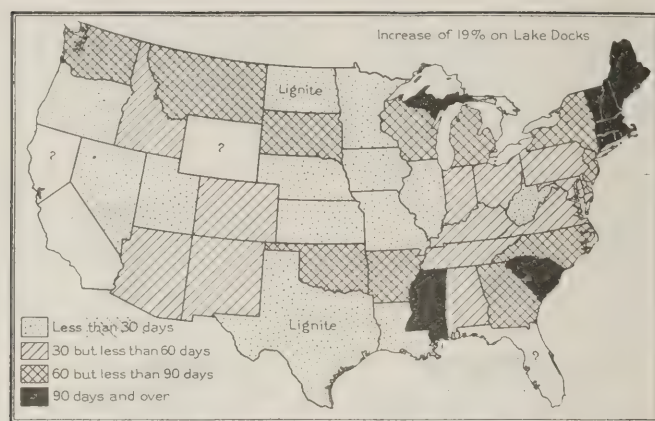

FIG. 3—DAYS' SUPPLY OF SOFT COAL ON HAND AT INDUSTRIAL PLANTS, SEPT. 1, 1923

At the average rate of consumption that prevailed in August, reserve stocks at industrial plants other than steel and byproduct coke would have lasted on the average 56 days. The map shows how the supply varied from state to state. Note the heavy stocks in New England and those in other states east of the Mississippi. Illinois and West Virginia only had less than 30 days' supply. Based on reports from 2,224 plants.

and in the preceding table are based upon reports of tons on hand and consumed received from about 5,000 consumers, so selected as to be fairly representative of all commercial consumers.

Fig. 3 shows graphically the variation in stocks in each state. The map shows the days' supply held at general industrial establishments, excluding steel and byproduct coke plants. This is the largest group of consumers and the one that shows best the geographical distribution of stocks. Changes in activity in this group are quickly reflected in the coal market, and likewise changes in the coal market soon become apparent in the reserve stocks of industrials.

Taking the country as a whole, the stocks held by general industrial plants on Sept. 1 were sufficient to last 56 days on the average, an increase of two days over the supply on Aug. 1. The importance of consumption in determining the adequacy of a known supply is strikingly illustrated by a comparison of stocks on Sept. 1 with those on Nov. 1, 1921. The actual tonnage on Sept. 1, 1923, was about 15 per cent larger than it was two years ago, whereas it would have lasted 11 days less time, owing to the present greatly increased rate of consumption.

The distribution of stocks as shown by the map in Fig. 3 closely resembles that on other dates when the reserves were large and business was active. The entire territory east of the Mississippi appears to be fairly well supplied, with the heaviest stocks in the long-haul sections such as New England, and the Southern Atlantic and Eastern Gulf Coastal States. The three coal-producing states, Illinois, Maryland, and West Virginia, had less than a 30-days' supply. As usual most of the Middle West and the lignite-burning states had less than 30 days' supply. The Northwest and Rocky Mountain States had supplies ranging from 30 to 90 days.

Reports from electric-utility plants indicated an appreciable addition to stocks, but consumption increased to such an extent that the days' supply—52—was the same as that on Aug. 1. On Nov. 1, 1921, such plants had a 54 days' supply, and on Jan. 1, 1922, a 51 days' supply.

Stocks at coal-gas plants continued to increase in August and a new record—104 days' supply—was established. This was 6 days' larger than the supply on Aug. 1, 1923, and exceeded that on Nov. 1, 1921, by 23 days.

Complete returns from byproduct coke and steel plants showed the following reserves on Sept. 1, 1923, at the rate of consumption in August, and on Nov. 1, 1921:

BYPRODUCT PLANTS			STEEL WORKS		
	—Days' Supply— Sept. 1, 1923	Nov. 1, 1921		—Days' Supply— Sept. 1, 1923	Nov. 1, 1921
Low-volatile.....	31	46	Steam coal.....	28	65
High-volatile.....	29	36	Gas coal.....	42	34
Average.....	30	38	Average.....	33	46

As in the case of the general industrials, a simple statement of the number of tons would not properly reflect the adequacy of the supply. Whereas the byproduct coke plants had 77 per cent, and the steel plants 24 per cent more coal on hand on Sept. 1 than on Nov. 1, 1921, the days' supply was 21 per cent and 28 per cent less, respectively.

The railroads added heavily to their supply of fuel coal during August, and on Sept. 1 had on hand close to 16,000,000 tons. This supply, which included the quantity in cars and chutes, as well as that in stockpiles, was sufficient to last 44 days, against a 39-days' supply on Aug. 1, 1921, and 31 days' on Nov. 1, 1921. The present supply is but 19 per cent less than the enormous total of 19,800,000 tons held by the railroads on April 1, 1922.

Retail dealers' deliveries of soft coal increased sharply in August, the average daily rate being more than 20 per cent higher than during July. Receipts were somewhat in excess of deliveries and there was a slight increase in the actual tonnage on hand. Retailers' stocks on Sept. 1 were sufficient to last an average of 38 days, against 45 days' supply on Aug. 1, 1923, 46 days' on Nov. 1, 1921, and 39 days' on Jan. 1, 1919.

All available information indicates that during August there was a comparatively small increase in the quantity of bituminous in transit, which probably did not exceed 2,000,000 tons.

Coal on the Upper Lake Docks.—Practically complete reports show that stocks on the docks of Lakes Superior and Michigan increased from 5,361,000 tons on Aug. 1 to 6,400,000 tons on Sept. 1, 1923. On Nov. 1, 1921, the total was 8,824,279 tons.

Reports from an incomplete list of producers whose store showed that the quantity held by them decreased 672,000 tons on Aug. 1, to 440,000 tons on Sept. 1. Unbilled coal standing in cars at the mines decreased from 560,000 to 470,000 tons, and on Sept. 1 coal awaiting reconsignment at junction points and terminals totaled 37,000 tons, against 65,000 tons a month ago.

Anthracite.—Retail dealers' stocks of anthracite decreased slightly in August, and their total supply on Sept. 1 was perhaps 8 per cent less than on Aug. 1. Reports from the dock operators indicated a total of 506,000 net tons on the Lake Michigan and Lake Superior docks on Sept. 1. Under the stimulus of urgent demand the production of anthracite in August was at a high rate that yielded a total output that has been exceeded but twice during the corresponding months of the past 10 years. It seems quite evident that but little of the household sizes were burned, and that practically the entire quantity of such sizes was added to stocks, either by consumers or retail dealers.

There are no available statistics on householders' stocks,

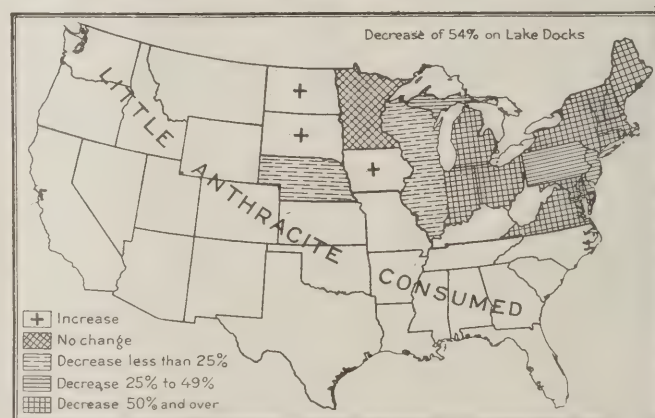

FIG. 4—HOW RETAILERS' STOCKS OF ANTHRACITE ON SEPT. 1, 1923, COMPARED WITH THOSE ON AUG. 1, 1921

Stocks of anthracite in retail yards decreased 7 per cent in August. The supply on Sept. 1 was sufficient to last 21 days at the rate of delivery that prevailed in August. The map shows how stocks on Sept. 1, 1923, compared with those on Aug. 1, 1921. In 12 of the 21 states where anthracite is consumed in quantity the supply on Sept. 1 was at least 50 per cent less than on the earlier date. Only in three states were the stocks larger.

but correlation of production figures and stocks held by retail dealers indicate that householders' bins must be fairly well stocked for this season of the year, even though the carry-over from last winter probably was unusually light. The recollection of their inability to obtain necessary supplies during the winter of 1922, and the apparent certainty of a strike on Sept. 1, 1923, appear to have induced many to obtain their supply earlier than usual. The result has been that current production has passed through the retailers to the consumers, and while retail stocks appear unusually low, the ultimate consumer is in a stronger position thereby.

The deliveries by retail dealers in August were at such a rate that retailers were not able to add to their reserves, and in fact their stocks declined. It has not been possible for the government to make a complete count, but reports from a group of 442 dealers who have reported regularly since 1919 show a total of 777,059 net tons on hand on Sept. 1, 1923, a decrease of about 8 per cent during August. These dealers had 19 per cent less than on Jan. 1, 1919; 47 per cent less than on Nov. 1, 1921; 44 per cent less than on Jan. 1, 1922, and 60 per cent more than on Nov. 1, 1922, when stocks were abnormally low as a result of the miners' strike last year.

Shipments of anthracite off the Upper Lake docks exceeded receipts in August, and the stocks on the docks on Sept. 1 decreased to 506,000 net tons. Stocks on Nov. 1, 1921, were 1,316,000 tons; Jan. 1, 1922, 1,331,507 tons; Sept. 1, 1922, 71,503 tons; Aug. 1, 1923, 608,726 tons.

Stocks of Coke at Byproduct Plants.—The rate of accumulation of coke at byproduct coke plants slowed up considerably in August. The total on hand Sept. 1 was 501,000 net tons, against 430,000 tons on Aug. 1 and 871,000 tons on March 1, 1922.

LATEST MAIL ADVICES from Great Britain are to the effect that no agreement has been reached in regard to the coal-trimming tariff. The matter is the subject of discussion between representatives of the Shipping Federation and the unions. Representatives of the Ministry of Labor also are participating.

Coal-Mine Fatalities High in August
Due to Kemmerer Disaster

Accidents at coal mines in the United States during the month of August killed 295 employees, according to reports from state mining departments to the Bureau of Mines of the Department of the Interior. Included in this number are 99 deaths in a gas explosion at Kemmerer, Wyo., on Aug. 14. The output of coal during August was 57,732,000 tons; thus the fatality rate per million tons was 5.11, compared with 3.55 in July. Without the Kemmerer disaster the rate for August would have been 3.39. The August rate last year was 3.72.

From the beginning of 1923 to the end of August, 1,738 fatal accidents have occurred at coal mines, representing a ratio of 3.99 deaths to each million tons of coal produced. During this period the fatality rate for bituminous-coal mines was 3.73 and that for anthracite 5.38. For the corresponding eight months last year—a period covering a five-months strike in the industry—the fatality rate for all mines was 4.17, the bituminous rate being 3.91 and the anthracite rate 6.79. Thus the accident figures for 1923 to date record an improvement over last year's record for both anthracite and bituminous coal mines.

The explosion at Kemmerer, Wyo., on Aug. 14 raised the number of major disasters during the current year to 6 with a total loss of 249 lives, as compared with 8 similar disasters causing a loss of 87 lives during the corresponding eight-months period last year.

The present year's record to date for all fatalities from all causes shows a reduction in the fatality rates per million tons for haulage accidents, for falls of roof and coal, and for electricity; an increase for explosions of gas and dust; and no change in the rate for explosives.

The fatality rates per million tons, by main causes of accidents, during the first eight months of 1922 and 1923 were as follows:

	1922	1923
Falls of roof and coal.....	2.057	1.800
Haulage	0.773	0.684
Gas and dust explosions.....	0.432	0.686
Explosives	0.173	0.179
Electricity	0.161	0.126

COAL-MINE FATALITIES DURING AUGUST, 1923, BY CAUSES AND STATES

New York Coal Survey Shows Soaring Prices

Edwin J. O'Malley, Commissioner of Public Markets of New York City, issued a reply Oct. 5 to Governor Smith's series of questions relative to the coal situation in New York. In a detailed examination of coal supplies, prices and alleged profiteering in the city, Commissioner O'Malley says consumers have reached the limit of their patience in standing a continued increase in the cost of coal.

The prevailing price of anthracite in June, 1923, according to Mr. O'Malley, was \$13.50, which obtained until the suspension of operations in the mines, Aug. 31. At the present time, however, says the Market Commissioner, the price has been fixed at \$14.25 in Manhattan with 50c. for delivery and 25c. extra for trimming, making a ton of coal delivered to the cellar cost \$15. The dealers have thus shifted the cost of a part of the delivery upon the consumers."

Regarding profiteering the Commissioner says: "This question is difficult to answer. The question as to whether profiteering existed would depend wholly upon how much was paid for the coal. Books of dealers would have to be investigated to get this information.

"This office would view any price exceeding the price set by the old dealers, \$14.25 to \$14.50, as profiteering. The Brooklyn, Queens and Staten Island prices, ranging up to and exceeding \$17.50, are simply unanswerable. The standard dealers themselves realize that these prices are doing no good to the coal dealers. The dealers who are charging these prices claim they are having to pay independent coal operators higher prices. In connection with this, the situation extends to the mines and includes the old controversy of the higher prices charged by the 'wildcats' and the regular independents. The writer is of the opinion that the State of Pennsylvania could and should easily absorb the cost of the strike, that is, the 60c. a ton paid to the miners.

"In view of the fact that very little coal had been coming into the city previous to this investigation, and no deliveries being made, consumers were obliged to order without knowing the quantity or quality of coal they would get or what price they would have to pay. The situation was, to say the least, and still is, pregnant with opportunity on the part of dealers or operators inclined to profiteer."

Tillson's Resignation Greatly Regretted

At the Buffalo meeting of the National Safety Council, held at the Hotel Statler, Oct. 1-5, the Mining Section with much regret accepted the resignation of Benjamin F. Tillson, who for many years has been the chairman of that section. Mr. Tillson was reappointed a director to succeed himself.

In all its history the section has had only two chairmen—the late H. M. Wilson and B. F. Tillson. Mr. Tillson's work has been most fruitful of results. In consequence of it the Bureau of Mines has widened its statistical inquiry into the causes of accidents and their number and duration. The Bureau of Standards is undertaking an inquiry into a means of ascertaining the condition of the entire length of a wire rope without destroying any part of it. The National Safety Council has made an arrangement with C. Lorimer Colburn whereby Mr. Colburn has traveled the country in the joint interest of the Bureau of Mines and the Council, making possible the formation of three conferences, one at Butte, one at Globe and one at Duluth, and finally the American Institute of Mining and Metallurgical Engineers has formed a Committee on Safety to hold with the Mining Section of the National Safety Council a meeting to discuss safety at the annual New York session of the former body.

For the ensuing year R. Dawson Hall, engineering editor, *Coal Age*, was elected chairman; John L. Boardman, safety engineer, Anaconda Copper Mining Co., Butte, Mont., first vice-chairman; J. B. Warriner, Lansford, Va., general manager, Lehigh Coal & Navigation Co., second vice-chairman; George Martinson, Pickands Mather Co., Hibbing, Minn., third vice-chairman, and C. Lorimer Colburn, U. S. Bureau of Mines, Washington, D. C., secretary.

The general officers of the National Safety Council are: L. A. Du Bois, president; Henry A. Reninger, vice-president in charge of industrial safety, including the mining section; Homer E. Niesz, vice-president and treasurer; Marcus A. Dow, vice-president in charge of public safety; C. B. Auel, vice-president in charge of general activities; George T. Fonda, vice-president in charge of local councils; David Van Schaack, vice-president in charge of public relations, and W. H. Cameron, managing director and secretary.

Mr. Colburn, for the Bureau of Mines, is touring the country in behalf of the Joseph A. Holmes Safety Association. Though he is not now giving his full time to the work of the National Safety Council he is permitted to perform for it such services as may be accomplished without interference with his other duties, which, by the way, will shortly provide for visits to coal-mine regions.

Reds Receive Aid and Encouragement from Non-Union Operators, Says Searles

Replying to the recent statement of John C. Brydon, president of the National Coal Association, which ridiculed the recent exposé by the United Mine Workers of Communist activities in the coal fields, Ellis Searles, editor of the *United Mine Workers' Journal*, charged in a statement issued Oct. 7 that "Communists and other destructive Reds have received substantial encouragement and aid from non-union coal operators." At the same time Mr. Searles, in behalf of the union, proposed that a committee of the U. S. Senate make a thorough investigation of the subject and predicted that, if that were done, "there are persons in and out of the coal industry who probably will feel like running for cover."

"It is significant," said Mr. Searles, "that the only attack upon the revelations contained in those articles came from the non-union coal operators, who are managing and directing the National Coal Association. These non-union operators are as anxious as the Communists to wreck and destroy the United Mine Workers of America. Both are working to accomplish the same purpose, and the fact that these non-union operators, headed by John C. Brydon, have thus joined hands with the Communists and rushed to their defense has done much to confirm the well-grounded belief among the union miners that the Communists and other destructive Reds have received substantial encouragement and aid from non-union coal operators in their various activities."

Mr. Searles said that some newspapers in commenting on the union's exposé "criticized the United Mine Workers of America because this organization did not make public during, or before, the trials at Herrin, Ill., the fact that the Herrin massacre was fomented, instigated and engineered by Communists, instead of waiting until months afterward. The fact is, we were not aware of the Communist plot until after the Herrin trials. Therefore, it was impossible for the union to expose the matter at that time. The facts were given to the public as soon as it was possible to do so in definite form. The Herrin massacre occurred in June, 1922. We started our investigation of Communist activities in February, 1923, and the investigation was not completed until the last of August, 1923. We published the exposé in the week of Sept. 10."

THE U. S. SUPREME COURT has been asked to set for early argument the appeal of the Federal Trade Commission in the injunction suit instituted against it by the Claire Furnace Co., the Ella Furnace Co., the Reliance Coke Co., and others. This controversy, which involves the right of the Federal Trade Commission to require the filing of production, cost and sales reports of goods entering into interstate commerce, arose in the Supreme Court of the District of Columbia. The courts of the District of Columbia held that the Commission had no right to compel the production of this information and the government appealed. The government says the effect of the injunction is to hamper the Commission in its investigations.

Flood of Coal Legislation Expected to Feature Forthcoming Session of Congress

All Factions Likely to Introduce Proposals for Curb on the Industry
—Look to President to Ask Prompt Consideration of Commission's Findings—Speculation on Likelihood of Bituminous Strike

BY PAUL WOOTON

Washington Correspondent of *Coal Age*

An avalanche of coal bills may be expected at the forthcoming session of Congress. The number of radical members has increased in each house. Almost every one of them is waiting impatiently for an opportunity to place drastic curbs on an industry so important and basic as is the production, distribution and marketing of coal. Administration members will be prompt to support the Coal Commission by introducing the numerous bills which would be necessary to cover the legislation requisite to carrying into effect the Commission's recommendations. In addition, there will be various legislative proposals from members outside the two groups mentioned who will put forward ideas of their own in view of the fact that coal legislation will be one of the matters likely to receive early attention.

The President is expected to ask Congress in his first message to give prompt attention to the report of the Coal Commission. While it is possible that Mr. Coolidge will suggest the specific legislation which he deems necessary to carry the Commission's ideas into effect, it is thought more likely that he will not undertake detailed recommendations. It is thought most probable that the President's first message will do no more than commend the report to the early and careful consideration of the legislative branch. There is reason to believe, however, that Mr. Coolidge will not be content to allow the matter to drift if he can prevent it. If Congress does not take hold of the problem vigorously, many expect the President to make specific requests for the legislation which he deems necessary to a better functioning of the coal industry.

TROUBLE LOOMS IN BITUMINOUS-COAL INDUSTRY

The new Congress will not have been in session long, however, before the black clouds of trouble in the bituminous industry will be much in evidence. Before the Congress is two months old there will be abundant indications that a great strike is likely. This in itself will hasten the consideration of coal legislation.

The fact that the anthracite mine workers have received an increase in their wage makes it absolutely certain that the bituminous workers will demand an equal if not a greater increase. It already is apparent that the operators in the union fields will be in no frame of mind by the first of the year to concede any wage advance. A deadlock is rather expected to occur early in the negotiations.

The predictions now being made that there will be no bituminous strike are based on the belief that the odds are sufficiently against the union to preclude the men going out if their demands are denied. It probably is true that the accumulation in the United Mine Workers' treasury is small. It is true that the railroad workers are not likely to assist them. It is true that they will not have the help of a simultaneous strike on the part of the anthracite workers. It is true that the non-union fields will be in a position to furnish more coals than ever before—probably enough to meet most of the requirements of the country. Those who are making these predictions, however, are underestimating the power and the determination of the United Mine Workers of America. Even with the odds against them, those best informed believe, they will not hesitate for a minute to call a strike if it should be decided that it is justified.

All admit that there will be great pressure from the public for legislation. It is not greatly concerned with the difficulties of the industry and there will be no particular

pressure to rid coal of needless competition or the thousand and one other internal difficulties from which it is suffering. What the public wants is relief from high prices and an assurance of continuity of coal supplies. The public's conception of price, in many parts of the country, is based on the prices demanded for anthracite. The fact that bituminous coal may be available to them at less than cost frequently is overlooked. The public evidently has reached a point where it wants some guarantee and it will not be surprising to see strong pressure behind bills proposing compulsory inspection of coal shipped in interstate commerce or a bill going even so far as to propose limitation of coal prices.

The suggestion of Representative J. J. Rogers, of Massachusetts, that an embargo be placed against exports of anthracite has not been given full consideration by President Coolidge, it was stated at the White House. It was said, however, that the President is inclined to believe that an embargo would be a matter "of considerable delicacy" which would require careful consideration both as to its advantages and disadvantages and as to the possible reaction in foreign countries which depend upon imports of anthracite from the United States.

I. C. C. Grants Virginian Ry. Rehearing

Thorough discussion of the proposal to withhold trackage from new coal mines, before final action is taken, is insured by a decision of the Interstate Commerce Commission Oct. 6 allowing a rehearing in the case. The rehearing will begin in Washington, Oct. 19, before Charles D. Mahaffie, director of the finance bureau of the Commission. Last June the Commission denied an application of the Virginian Ry. to extend its rail facilities to additional mines on the ground that the railroad company is not in a position to insure a constant car supply to the properties already having trackage connections. The case is regarded as one of the most important which has come before the Commission. The proponents of the principle of such control are actively supporting the Commission's position, which is certain to be assailed vigorously by those who do not want to see this obstacle raised against the opening of more coal mines.

DUE TO THE FACT that the Coal Commission was unable to go deeply into the study of intermittency in the operation of coal mines, the Department of Commerce expects to take up again its study of the subject. The department had made a good start on study of intermittency when the work was interrupted by the coal strike last year. With the information already at its disposal, the department will be able to complete the work in a comparatively short time, it is believed.

AN INDICATION of the regard in which F. R. Wadleigh is held by those concerned with coal is set forth in an analysis by a representative of the American Mining Congress of letters received by Mr. Wadleigh just prior to the termination of his duties as Federal Fuel Distributor. The communications are from representatives of the coal industry, railroads, national associations and state fuel administrators.

Pinchot Requests Coal Commission Data In Move to Reduce Fuel Prices

In a new move to reduce fuel prices to consumers Governor Pinchot of Pennsylvania, according to a press report, has made a formal request for the information gathered by the U. S. Coal Commission in its recent survey of the coal industry, now in possession of the U. S. Geological Survey. It is said, however, that his request will be refused.

According to word reaching the Department of the Interior, Mr. Pinchot believes that with certain data from the Coal Commission he could reduce the cost of fuel. He is anxious to get all data compiled in connection with the questionnaires sent out to the operators by the Coal Commission.

Governor Pinchot still holds to the opinion that the increase granted to the miners should be absorbed by the operators and not by the consumers. In his request to the Coal Commission for the data contained in the questionnaires it was said that he expressed the opinion that the information should be made public and not pigeonholed in the office of the U. S. Geological Survey. With this information in the hands of the public Governor Pinchot believes that his position in the matter would be clarified.

Officials of the Interior Department, however, declare that the operators gave the government the information of their production costs solely for governmental use and not for political-campaign purposes. Officials of the department believe they have no authority to make the information public. A suggestion was made that the Attorney General might be asked for a formal opinion as to the legality of the department retaining the information being sought by Mr. Pinchot.

Wadleigh Urges Industrial Co-operation In Helping Coal Industry

That the Department of Commerce and the Bureau of Mines may have the advantage of the viewpoint of industry in connection with their work on coal, F. R. Wadleigh, recently Federal Fuel Administrator and now coal specialist employed jointly by the Department of Commerce and the Bureau of Mines, has addressed the following letter to a number of leaders in the coal industry:

"Having resumed my former work as chief of the Coal Division, Bureau of Foreign and Domestic Commerce, Department of Commerce, I desire to make the work of the division of the greatest possible use to the coal industry, not only as regards foreign markets but also in the domestic trade. I have already arranged to continue the issue, monthly, of the survey of general conditions in the domestic trade, and of the statement relating to overseas coal markets, as both of these seem to have met with general approval and to be a distinct service to the trade, as well as to consumers.

"In order however, to broaden the activities of the division, I should like to have the views of leaders in the industry as to how the desired results can best be accomplished and will, therefore, appreciate an expression from you, at your early convenience, on the subject. I believe that the Coal Division can be of considerable service to the industry, provided it can obtain the co-operation and assistance of those engaged in it.

"Particularly, I should like to have your opinion on the advisability and value of the appointment of an advisory committee to be made up not only of operators but also of representatives of the wholesalers and of the retail dealers. It seems to me that such a committee, properly constituted, would be of considerable value to the industry and, through the wide ramifications of the Department of Commerce, together with the technical activities of the U. S. Bureau of Mines, with which I am also connected, could be made of great service, in the way of securing and making available a fund of information, both economic and technical, and could also formulate and put in effect plans for closer

relations with the railroads and the general public, as well as between the various branches of the industry itself.

"My unofficial position as connecting link between the American Railway Association, the individual railroads and the Department of Commerce should give the means of keeping the industry in closer contact with the railroads."

Electric Power Service to Mines Spreads Through Kentucky

Kentucky coal mining may be largely affected by power development just announced by the Insull public-utility interests. The plans of these organizations call for larger and better power developments in the state, with hook-up connections which will make it possible to supply current to the various mine districts even if one unit or power plant is shut down through accident.

A \$3,000,000 steam plant will be erected by the Indiana Public Service Co., at Jeffersonville, Ind., on the Ohio River, across from Louisville. This will be hooked up at Louisville to high-tension transmission wires which will run to Lexington, Ky., over to Dix River, where a large hydro-electric plant is to be installed, by the Kentucky Hydro-Electric Co., a subsidiary. From this plant there will be a hook up to southeastern Kentucky, where the Kentucky Utilities Co., another subsidiary, has big power plants at Varilla, Ky., and also at Pocket, Va., producing power at the mouth of the mines, from low cost fuel. A million-dollar power plant is also being started four miles from Pineville, on the Kentucky River.

The Insull interests also plan to carry high tension lines from Louisville south and west to the western Kentucky coal fields, where the Kentucky Utilities Co. operates over 200 miles of transmission lines serving a large number of mines, and a number of towns. The company has several plants in western Kentucky, and controls the power plants of the Duncan Coal Co. of Greenville, and St. Bernard Mining Co. of Earlington, each of 5,000 hp. or better, producing power on screenings direct from the mines to the boiler rooms. These plants are under lease to the utilities company, which in turn sells power to the companies owning the plants, and buys fuel from the owners.

In addition the Louisville Gas & Electric Co., is planning a big hydro-electric plant, at the Falls of the Ohio, at Louisville, which will have a capacity of 400,000 kw.-hr., more current than is now used by all the utilities in Louisville, and will be in service 70 per cent of the year. This plant will have surplus power for sale, some of which can be utilized by the Insull interests if needed.

"Giant Power Board" Organized

Pennsylvania's Giant Power Board recently was organized at Harrisburg, and its purpose will be to make a survey of the power resources of the state. Morris L. Cooke, formerly Director of Public Safety of Philadelphia, was elected director in charge of the survey. The board was provided by an act of 1923 and is a part of the plan of the Governor to develop the electric and water power of the Commonwealth so that cheap energy may be provided for its citizens. Governor Pinchot presided at the opening meeting and called attention to the probable far-reaching effect of giant power on the coal industry.

The Giant Power Survey Board consists of the Governor, the Attorney General, the Secretary of Forests and Waters, the Chairman of the Public Service Commission, the Secretary of Agriculture, the Secretary of Labor and Industry, the State Geologist, a Deputy Attorney General and an engineer. Deputy Attorney General Philip P. Wells and Robert H. Fernald, director of the department of mechanical engineering at the University of Pennsylvania, have been designated by the Governor to these two latter places.

ORAL ARGUMENT before the Interstate Commerce Commission of the case of the Victor-American Fuel Co. vs. the Denver & Salt Lake Railroad Co. will be conducted in Washington on Oct. 15 before the full Commission.

Denying Gouging, Warriner Blames Higher Anthracite Prices on Pinchot and Mines

Denying that anthracite operators have been gouging, Samuel D. Warriner, chairman of the Anthracite Operators' Policy Committee, places the entire blame for the high cost of coal directly at the feet of labor. Addressing 200 at a luncheon of the City Club, of Philadelphia, Oct. 5, Mr. Warriner said that "the last increase, the price of peace in the mine fields, was Governor Pinchot's method of assuring a winter's supply of coal, and he must shoulder the responsibility for it."

He declared that the operators were in accord with the Governor in his plan to settle the strike in order to prevent a coal famine, but the 10-per cent wage increase which the Governor had at that time declared necessary was not justified. The Governor had been warned that it would be paid by the consumer.

The drastic house cleaning that the Governor declared necessary in the industry in a recent address did not apply to the operators, in Mr. Warriner's opinion, but to the United Mine Workers of America.

Governor Pinchot's peace plan, according to Mr. Warriner, showed conclusively that to the Governor the important thing was to get the miners back to work, and that price was secondary.

Speaking specifically, Mr. Warriner said that the high cost of coal was due directly to the high wages of the miners, out of all proportion to other industries; to the reluctance of the men to do a full day's work; to the reduction in the number of hours to eight, without any similar wage reduction; to the increase in the cost of materials, and to the restrictions upon the men placed by the United Mine Workers of America.

"The operators," he declared and backed up his assertion by figures, "cannot absorb the last increase, and it is unfair for the Governor to blame it on the industry, when we have no jurisdiction whatever over transportation costs or distribution methods."

WAGES UP 170 PER CENT; COAL COST, 120 PER CENT

"Since the pre-war period the wages of anthracite miners have risen approximately 170 per cent," he declared, "while the cost of coal has only increased 120 per cent. The cost of living during the same time increased only 50 per cent. The annual wage bill for mining the 70,000,000 tons of anthracite was \$113,000,000 in 1913-14. In 1921, the last full year, it had jumped to \$285,000,000. Now, with the added 10 per cent increase, it will jump to about \$325,000,000. During the same period the cost of materials necessary in mining operations had increased in about the same proportion."

"Now as to the price of coal. In 1913-1914 a ton of nut coal cost \$7.25. Today, under the new schedule, it costs \$16; an increase of 120 per cent. There is no justification for such a price. It is economically unsound and will result in a discontinuance of the use of anthracite, and will have its effect on the prosperity of the operators and on the earnings of the men."

Mr. Warriner said "the men receive on an average \$1,800 a year. Skilled men receive as high as \$5,000 a year, and by reason of the last increase the average wage will be \$1,990."

"The operators want cheap coal, wide distribution and active marketing. That spells prosperity for us all. There is no autocracy in the industry. We have better schools in the mining sections than in most communities. The miners have good homes, garages, automobiles. The savings-bank deposits have trebled in our communities. Our employees gradually are becoming stockholders in our operating companies. There surely is no autocracy."

"Approximately 50 per cent of the coal mined is of the small buckwheat sizes, not used in homes. It must be sold in competition with bituminous. We are, therefore, unable to add the last wage increase to the cost of this coal. Necessarily, we pass it on the domestic sizes. If we can educate the public to use the buckwheat sizes in their

homes it will, naturally, reduce the demand for anthracite, and thus lower prices eventually will come about. We are now working on plans for bringing this to the attention of the public."

The City of Philadelphia, through the Girard Trust, is getting a share of the increased coal costs, according to Mr. Warriner. "The operators who lease the coal lands of the Girard Estate pay a royalty on a sliding scale basis. The higher the price, the greater the royalty. So you see your own city is profiteering."

U. S. Shipping Board Opens Coal Bids In New York and Norfolk

The U. S. Shipping Board opened bids at New York on Oct. 4 for furnishing and delivering alongside vessels New York harbor on Oct. 11, 2,300 gross tons of Pool 9 bituminous coal. The following proposals were received: Imperial Coal Corporation, \$4.87 per ton; Johnstown Coal & Coke Co., \$5.64; Penn Fuel Co., 4.97; Gormley Coal Co., \$5.39; Rhodes Fuel Corporation, \$4.88; Knickerbocker Fuel Corporation, \$5.04; Seiler Coal Co., \$4.88; Campbell, Peacock & Kinzer, \$5.20; W. A. Marshall & Co., \$4.98; Commercial Coal Co., \$5.39; Lee Coal Co., \$4.84; Hartmann Coal Co., \$5.28; Pattison & Bowns, Inc., \$5.40; Dexter & Carpenter, \$5.52, and H. B. W. Haff, \$5.15. The bids ranged on a basis of about \$1.65 to \$2.36 per net ton f.o.b. mine.

Bids opened by the U. S. Shipping Board at Norfolk, Va., for furnishing and delivering f.o.b. piers, Hampton Roads, 1,600 gross tons of Pool 1 and or Pool 2 (Pocahontas and New River) coals on Oct. 16 brought the following quotations: Hasler & Co., \$4; Brown Coal Co., \$4.19; Johns Bros., \$4.25, and Lake & Export Co., \$4.50, or on a basis of \$1.32 to \$1.76 per net tons f.o.b. mine.

Wadleigh Prepares Data on Coal Exchanges

With the idea of calling the attention of the American coal industry to the advantages of maintaining various coal exchanges, F. R. Wadleigh, former Federal Fuel Distributor, acting in his capacity as chief of the Commerce Department's Fuel Division, is compiling information on the subject. In addition to soliciting the views of prominent men engaged in the coal trade here, he is securing authoritative statements from the managers of the coal exchanges in England. During his long residence in England as the representative of a large American coal exporting company, Mr. Wadleigh was much impressed with the benefits which were derived from the maintenance of the coal exchange.

A special report on export methods also is being prepared under Mr. Wadleigh's direction.

A SUPPLEMENTAL FOURTH SECTION ORDER issued Oct. 2 by the Interstate Commerce Commission suspended the effective date of certain tariffs ordered to be put into effect by the Commission in its decision in Docket 12698 in the Ohio-Michigan coal case. In Application No. 1952, filed by the Louisville & Nashville R.R., and No. 1764, filed by the Chesapeake & Ohio Ry., these carriers sought authority to continue to charge for the transportation of coal from mines in the Inner Crescent group to Detroit, Mich., rates which are lower than those contemporaneously in effect on like traffic to Tama, Ohio; Jackson, Mich., and other intermediate points, and the Kanawha & Michigan Ry., in Application No. 554, sought authority to continue to charge for the transportation of coal from the Kanawha district in West Virginia to Jackson, Mich., rates which are lower than those contemporaneously in effect to Pontiac, Mich., and other intermediate points in the Lansing group. These applications were denied by the Commission in its Fourth Section Order No. 8750, and rates corresponding with the Commission's order were to have been put into effect on Sept. 27, 1923. The supplemental order suspends the effective date of these tariffs until Nov. 26, 1923, which allows the railroads to continue the above-mentioned rates in effect until that date.

Production and the Market

Weekly Review

Prices for soft coal continue to slip downward, while production shows a slight drop, due to the resumption of anthracite mining. Production of soft coal reached 11,737,00 net tons in the last week in August whereas during the week ended Sept. 29 it declined to 11,308,000 tons, a drop of 429,000 tons. For the week ended Oct. 6 preliminary reports indicate a further decline. In spite of the reaction, however, the present rate of daily production, though below the record years 1918 and 1920, is well above 1919, 1921 and 1922. There were about 56,000,000 tons of soft coal in storage as of Sept. 1, according to the government stock report, an increase of about 4,000,000 tons over the revised figures for Aug. 1.

PRICE OF BITUMINOUS COAL DECLINES SHARPLY

Soft-coal prices declined six points last week, *Coal Age* Index registering 190 on Oct. 8, while the average price was \$2.30 as compared with \$2.37 the previous week. Declines occurred in Springfield, eastern and western Kentucky, Hocking, Clearfield, Cambria and Somerset and Pocahontas coals, while Mt. Olive advanced.

Production of anthracite is climbing, 2,025,000 net tons having been produced during the week ended Sept. 29, the first full week of mining since the termination of the strike, with indications pointing to about the same output for last week.

Lack of demand has caused a reduction in the running of most soft-coal mines. Coal for screenings has relaxed, causing an accumulation in some districts together with a lowering of prices. Buyers continue on a hand-to-mouth basis, due to heavy reserve stocks and the prospect of lower prices. Car supply has improved in some sections, while lost time because of "no market" has increased, caused in part by the reaction against better demand in anticipation of the anthracite strike.

The sag in the Chicago market continues. A smaller

volume of screenings is coming forward because of the cut in mining, giving operators hope of a stiffening of prices. Domestic demand in most regions is firmer. In New England the market seems duller. There are no increases in inquiries and no indications of improvement. Spot buying has practically stopped and contractors are curtailing shipments. The Ohio market is dull and in some sections as bad as at any time during

	Week Ended Oct. 1	Season to Oct. 1
Cargo	786,782	22,014,123
Fuel	50,008	1,192,258
Totals	836,790	23,206,651

the summer. The Pittsburgh market has declined from last week and consumers are showing no interest.

Lake shipments have declined during the past month, dumpings during the week ended Sept. 30 amounting to 836,790 net tons of cargo and bunker coals.

Export demand is quiet and there are no indications of improvement. Shipments from Baltimore during the first nine months of 1923 amounted to 1,426,767 tons of cargo and bunker coal and 175,723 tons of coke. Dumpings for all accounts at Hampton Roads during the week ended Oct. 4 totaled 324,093 net tons as compared with 256,730 tons in the previous week.

(a) Subject to revision. (b) Revised from last report.

Demand for bituminous screened coals and for coke as substitutes for anthracite has practically stopped, although there is a greater movement of coke than of the former. Inquiry for Welsh anthracite is slow and few new orders are reported as being booked.

Little Market Life at Chicago

The sag in coal continues in the Middle West, as reflected on the Chicago market. Demand for domestic sizes has not materially improved, so that prices on lump and egg Illinois and Indiana coals continue about the same as last week. The egg moves with difficulty. Lack of demand, however, has reduced the running time of most mines so that the volume of screenings has fallen off some. This encourages many sales agencies to hope that screenings will soon stiffen a little. Right now they remain at the bottom.

No interest worth mentioning has yet been shown in any coal reaching this market. Smokeless remains difficult to sell at \$3 for mine-run, and anthracite, now shipping here in some volume, remains a long time in storage yards. Real cold weather is essential and none is in prospect. The gen-

eral impression among the best-informed men in Chicago is that no important rise in the market can reasonably be expected for two or three weeks and that even then it will be a slow one, producing no price peaks during the entire winter—barring some powerful, and now unseen, influence.

In the Illinois fields there is not much activity. Everyone is saying the other fellow should shut down. The southern field is still a good deal clogged by no bills on egg and smaller sizes in spite of dumping screenings at almost any price. The DuQuoin field is running light except for one or two mines. Mt. Olive no-bills on steam sizes are holding up the production of almost everything else. Standard field conditions were fairly good until about Oct. 1, when the general slump slowed down every mine and no-bills piled up.

St. Louis Trade Dull

Mild weather in St. Louis has put an end to domestic deliveries and the dealers have no orders on hand. Their yards are full of coal and some of them are obligated to continue to take coal on contract with no place to put it. The demand has been for the middle-priced coal and the

Coal Age Index of Spot Prices Bituminous Coal F.O.B. Mines

	1923			1922
Index	Oct. 8	Oct. 1	Sept. 24	Oct. 9
Weighted average price	\$2.30	\$2.37	\$2.42	\$4.60

This diagram shows the relative, not the actual, prices on four-teen coals, representative of nearly 90 per cent of the bituminous output of the United States weighted first with respect to the proportions each of slack, prepared and run-of-mine normally, shipped, and second, with respect to the tonnage of each normally produced. The average thus obtained was compared with the average for the twelve months ended June, 1914, as 100, after the manner adopted in the report on "Prices of Coal and Coke, 1913, 1918," published by the Geological Survey and the War Industries Board.

situation in St. Louis is typical of that in all the surrounding territory in a retail way. Coke, anthracite and smokeless go begging. The number of oil burners put in this autumn has seriously affected the retail coal situation. Many householders are putting in gas heating plants.

All Kentucky Sizes Drag

It is admitted in Kentucky coal circles that demand is poor, and that a strike or severe car shortage or something like that would be necessary to start a buying movement or advance the price. All sizes in all fields of the state are reported as draggy. The retailers are contented to hold out and buy only for immediate needs.

The Lake movement continues heavy and this along with such general business as is in the hands of eastern Kentucky mines is resulting in overproduction of screenings, as industrial consumers appear to understand the situation fairly well and are refusing to buy screenings except at give-away prices. The very best grades of eastern Kentucky screenings are quoted at 75c. @ \$1 a ton at mine, while western Kentucky on pea and slack is quoting as low as 50c., and on nut and slack at around 90c. Mine-run also is draggy and runs from \$1.50 for off-grade stuff in eastern Kentucky to \$2.25 for the very finest gas coal, and from \$1.50 to \$2 in western Kentucky. Prepared sizes are being

held fairly firm in price. To reduce them with the screenings market as it now is would result in losses all along the line.

Northwest Idles Along

Coal demand throughout the Northwest was not much improved during the past week. No cold weather has struck in yet. The main interest in fuel in that general region centered on the increase in hard-coal prices, which varied from 65c. to 80c. on the standard domestic sizes and 10c. on pea.

New anthracite is coming into Duluth 75c. higher on egg, 70c. on stove and nut and 10c. on pea. Only two cargoes have been received during the week but sixteen more are reported on the way. Dock prices are: Egg, \$13.25; stove and nut, \$13.50; pea, \$11.10 and buckwheat, \$8.50.

Duluth prices on bituminous lump, run of pile and screenings, are:

Kentucky, \$7.50, \$7 and \$4.50; Youghiogheny, \$6.50, \$5.50 and \$4; Hocking, \$6.25, \$5.25 and \$3.75; splint, \$7, \$6 and \$4.25, and Pocahontas, \$10, \$6.50 and \$6.

All Milwaukee dealers are selling larger sizes of hard coal at advances ranging from 65c. to 80c. Stove is \$16.80; nut, \$16.65 and egg, \$16.40. Pea is up 10c. to \$14.30 and buckwheat is unchanged at \$11.50. These prices went into effect Oct. 4. Trade had been a bit unsteady before the advance because of doubt as to whether stocks on hand would advance too. They did. Demand for hard coal in Milwaukee is only fair and steam coal call has been light indeed. There has been considerable yield in price in competition between Western and Eastern coals.

Milwaukee wholesale prices on lump, pile run and screenings effective Oct. 4 are: Pittsburgh, Hocking and Youghiogheny, \$7.75, \$7 and \$6.25; West Virginia, \$8, \$7.25 and \$6; Pocahontas, \$12.50, \$8.50 and \$7.50, smithing, \$8.75; Kanawha gas mine-run, \$7; Illinois and Indiana, \$7.75, \$7 and \$6.25; coke, large sizes, \$14.90; pea and nut, \$11.90.

Western Trade Picks Up

Domestic demand throughout most regions of the West has been enough during the past week to justify an increase of 50c. in price. This applies to Kansas lump and Utah lump principally. Steam demand continues slow, however, and everywhere there are no bills in profusion. New Kansas prices drop screenings from \$2.50 to \$2.25 in a move to reduce the "no bills." There are no changes in Colorado prices. About 43 per cent of the production of the state was shipped out of the state during September.

Dullness Pervades Ohio Markets

Dullness characterizes the coal market around Columbus and as householders are not buying, retail business is quiet. Steam trade also is dull and the market on the whole is in as bad shape as at any time during the summer. Users are asking for the fancy grades such as smokeless and splints, and Kentucky grades also are being sold to a certain extent. Reserves are sufficient for from forty-five to sixty days. Railroads continue to take a fair tonnage and utilities are good buyers. The Southern Ohio Coal Exchange reports that for the week ended Sept. 22, 442 mines reported a production of 188,452 tons out of a total capacity of 695,630 tons.

Demand is generally dull in the eastern Ohio market, while steam buyers have at least thirty days' supply on hand. Retail yards report that domestic business is not as active as it was several weeks ago, but apartment houses and business buildings are stocking up to meet their obligations to furnish heat early this month.

Reports received at Cincinnati show that the efforts of the Logan County (W. Va.) producers to cut their wage scales has met with failure, but that some operators in Bell and Clay Counties, Kentucky, were more successful, although the cut was not large. A large amount of coal has been rejected during the past week or ten days. Bituminous and smokeless domestic coals are holding firm, while steam grades are weak. West Virginia 2-in. lump was quoted at \$2.25 @ \$2.50 on the Cincinnati market, with southeastern Kentucky 2-in. lump at \$2.25 @ \$2.75.

Further Slump at Pittsburgh

The market at Pittsburgh has slumped further and prices have gone below last July's level. It is difficult to sell coal, consumers showing no interest, the most conspicuous class being the steel mills and the shops that use steel. Steel interests are inclined to decrease their stocks of coal at by-product coking plants rather than increase them. The central Pennsylvania market is dull and there has been a noticeable drop in production, the total output for September having been 67,790 cars, as compared with 80,361 cars in August. Buffalo reports a quiet market. There is no demand and no indications of improvement.

New England Market Slow

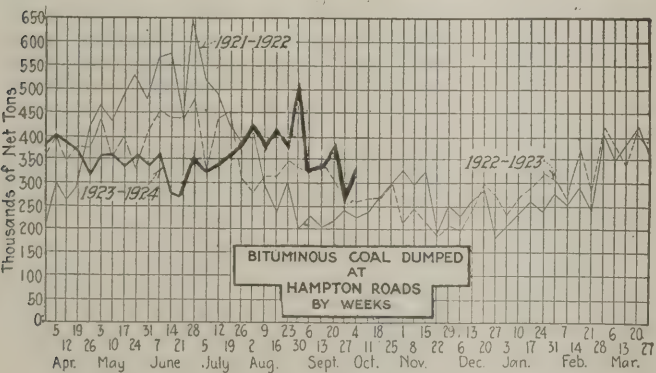

In New England the steam-coal trade might be considered even duller than in July if that were possible. Inquiry is of the most fugitive and elusive kind, and there are no indications of improvement. Not only is spot buying practically stopped but contractors are curtailing their receipts to correspond with reduced consumption. The largest textile mill of the world, for instance, at Manchester, N. H., has announced a shutdown in its cotton department, to continue for an indefinite period, and it is likely that this move will be followed by other manufacturers in the same line. Mill owners now see no prospect of anything like full-time production for a long way ahead.

Neither all-rail nor by water is there any volume of steam coal moving. Efforts to force coal on reluctant buyers have resulted disastrously to the shipper and few contractors have the hardihood now to send coal forward in advance of sale. Prices are depressed as low as the operators feel they can possibly go and pay their charges. In every direction the market is being combed over in the hope of developing enough business to warrant keeping the mines open at least a day or two a week. We are in the midst of the fall season with possible transportation troubles ahead, but consumers show no interest, largely because they have reserves on hand for three to four months.

There are rumors of prices f.o.b. Norfolk and Newport News of No. 1 Navy standard grades at less than \$4.75 per gross ton, but they are not substantiated. Accumulations at the piers are as heavy as can be allowed under the conditions and several of the smokeless agencies are following an extremely close-hauled policy of restricting shipments from the mines to replacements of coal actually dumped at the piers. At this end Pocahontas and New River have sold at less than \$6 per gross ton on cars at Boston and at Providence. These quotations are confined for the most part to wholesale dealers who have storage of their own and are not obliged to move tonnage in order to save car service or vessel demurrage.

Atlantic Seaboard Markets Inactive

There is little activity in the New York soft-coal market. Spot demand is slow and contractors are asking that their deliveries be reduced. It was reported that some operators had voluntarily reduced their contract prices in order to keep the coal moving. Many operators do not look for any considerable improvement before the new year, when consumers are expected to begin to build up reserve stocks before negotiations for a new wage agreement in the bituminous regions begin. There was some interest taken

in the opening of bids by the U. S. Shipping Board on Oct. 4 for 2,300 gross tons of Pool 9 coal, at which the prices submitted ranged on a basis of \$1.65@2.36 per net ton, f.o.b. mines. The Philadelphia market is quiet, the only activity being efforts to keep the stop tonnage on the move. There are numerous inquiries for protection on blocks of tonnage, and while some are willing to give protection to the end of March, the disposition is to sell blocks for about three months ahead.

At Baltimore there is some inquiry from industries which store large tonnages for the winter months. With car supply liberal, the movement of coal is in excess of any urgent demand. The activity in West Virginia is spotty, although production has not been affected materially. Due to the weakness of smokeless coals at tidewater, shipments are being made to Western markets whenever it is possible, owing to better prices prevailing and stronger demand. The market at Birmingham is quiet, with a restricted demand and sharp competition.

Dumpings for Lake movement during the week ended Sept. 30 amounted to 836,790 tons of cargo and fuel coals as compared with 878,058 tons the previous week. Although two months of open navigation still remain, dumpings of cargo coal have declined perceptibly in the past month, but this is not surprising, says the Geological Survey, as on Sept. 30 the cargo coal dumped the present season amounted to 22,061,001 tons, 1 per cent greater than the shipments in 1918, in which year the maximum Lake shipments occurred. During the same week 33,757 tons of anthracite was dumped at Buffalo for lake shipment, bringing the total for the year up to 2,168,576 tons.

Domestic Anthracite Moving Well

Movement of anthracite domestic sizes continues in good volume although dealers along the Atlantic seaboard could use large shipments. Not much of the high-priced coals come to the New York market, retail dealers there depending mostly on company product. Light shipments are complained of also in the Philadelphia market. Stove and chestnut sizes are mostly wanted, while the demand for egg and pea coals is on the increase. Baltimore complains of small shipments. The steam sizes move slowly. Buckwheat is being quoted by independent producers at prices below the company schedule of \$3.50. The strongest of the three coals is barley, but even this is being let go at less than company schedules.

It is hard to sell coke either for heating purposes, for blast furnace use or for foundry use, and prices show a further decline from last week. Standard prices coke is quotable around \$5.50, while heating coke is being quoted in the Connellsville district at around \$3.75. Production of beehive coke during the week ended Sept. 29 is estimated by the Geological Survey to have been 321,000 net tons a decline of 14,000 tons from the previous week.

Foreign Market And Export News

Great Britain's Coal Output Decreases Slightly; Welsh Market Unsettled

Production of coal by Great Britain's mines during the week ended Sept. 22 was 5,005,000 tons, says a cable to *Coal Age*. This compares with 5,245,000 tons the previous week, a decrease of 240,000 tons.

The Welsh market continues unsettled. The tone has been disappointing to the operators, who expected some increased demand from the United States. In addition, the European buyers have adopted a waiting policy and orders for the remainder of the year are anything but heavy. Belgium and Holland continue to buy steadily but not in large quantity, while the business with South America is very quiet.

Owing to the accumulation of stocks operators in many districts are finding great difficulty in getting their railway trucks cleared, and some mine stoppages have resulted. A few mines are favorably placed and have not reduced their prices, but there is such keen competition for business that buyers have been able to force concessions.

Operators are looking forward to the placing of the British Admiralty contracts, which is expected soon.

The Newcastle market is distinctly quieter, though operators are able to clear their outputs, and there is not much accumulation. The European demand is very slack, particularly that from Germany.

French Market Firm; Inquiry Drops

The French coal market is still firm. Due to the new turn in events in the Ruhr, inquiry for industrial coal has slightly declined. However, the market probably will become more active owing to the usual last-minute rush of retailers to take advantage of the summer prices. In spite of the difference in prices between the French collieries' rates and their foreign competitors it is asserted that no adjustment in prices will be made in the near future.

Belgian producers are considering the Paris market with more interest since their government intends to curb the

overexportation of fuels to other countries, especially to Holland and Switzerland.

Union Enters Retail Market at Norfolk

The Brotherhood of Locomotive Engineers, through their representatives at Norfolk, are offering Pocahontas coal at \$7.50 a ton, delivered in the homes. The coal is being sold at \$6 a ton at the car. It is of a somewhat lower grade than the coal being sold by local dealers for \$12 a ton, having been screened finer than the usual commercial product.

Business at Hampton Roads was slack last week in the face of a declining market, prices weakening and movement of coal showed a decline. Dumpings at all piers were below normal, and movement of coal in all directions was without feature.

Coastwise trade was the strongest, though somewhat below normal for this period of the year. Foreign business was holding its own, and showing no indication of an immediate improvement. Bunkers dropped somewhat, due to a temporary slump in general shipping. The tone of the market was dull, and a spirit of comparative inactivity was manifest in the trade.

News Items From Field and Trade

ALABAMA

The sale of the federal government's interests in the Gorgas steam plant, the initial units of which were constructed by the Alabama Power Co. and turned over to the Government under contract for use during the world war, the plant being greatly enlarged and expanded by the War Department, has made public a claim of H. E. McCormick, a prominent coal operator of the Birmingham district, to one-half ownership in the lands on which the plant is located, which promises to bring the legality of the contract under which the government's interest in the property was transferred to the power company for a sum approximating \$3,500,000, into question with a probability that the transaction will be aired in Congress at its next session or taken into the courts for adjudication. The McCormick interests claim that their half interest in the property was never acquired by the power company while the latter claims a perfect title to the property involved. The matter is of much interest in view of the fight of Henry Ford for the Muscle Shoals plant, in which Mr. Ford has persistently declined to eliminate the Gorgas steam plant from his bid for the government properties. The Gorgas plant is located in Walker County on the Black Warrior River and is supplied with coal from the mine of the Winona Coal Co. The lands carry the Pratt and America coal seams and are valuable holdings.

J. E. Creel, operating the Town Creek mine in Walker County, near Empire has sold the operation to Elmer Faucett, of Dora, for a consideration said to approximate \$10,000. Mr. Faucett will continue the mine in operation.

The Legislature of Alabama has passed an act increasing the salary of the chief mine inspector and his five assistants \$1,000 each and carrying an appropriation of \$50,000 per annum for the work of the mining department of the state, which practically doubles the fund formerly available and will enable the department to render more extended and effective service in the coal mining industry. The bill will doubtless receive the approval of the governor.

Announcement is made of an increase in the capital stock of the Rushton Coal Corporation of \$374,000 and a change in the name of the corporation to the Rushton Corporation. J. Frank Rushton is president; R. H. Woodrow, vice-president and general manager; William J. Rushton, secretary, and J. S. White, treasurer, all of Birmingham. The Rushton interests are now operating the Franklin Mining Co., at Powhattan, in the western section of Jefferson County, and the Piedmont Coal Co., in Walker County, near Dora. Although no official announcement has been made of the plans of the corporation the large increase in capital will more than likely be used for extensive development work.

The McLaughlin Coal Co. has purchased the retail coal business of the Empire Fuel Co. in Birmingham.

ILLINOIS

Considerable publicity is given in the St. Louis press to the suggestion of William D. Pratt, an engineer of Kansas City, that the economical method of conveying coal to St. Louis for steam plants is to reduce it to a small size and pump or flush it from a central mining point a few miles from St. Louis to the city, utilizing the Free Bridge to cross the river. A right of way across East St. Louis would be necessary, but this is solved by a new ordinance of the St. Louis board of aldermen passed over the mayor's veto and in opposition to the combined interests of the St. Louis railroad monopoly with its 29c. per ton "arbitrary" on coal, appropriating several thousand dollars for condemnation of a right of way for the north-east approach for the Free Bridge elevated over the city of East St. Louis, as the first step to free St. Louis from the "arbitrary." This approach could be used for coal from the mines in Madison, Macoupin and adjoining counties and the northern section of St. Clair County. Practical engineers discussing it agree that conditions at St. Louis are better for this than elsewhere at this time for this first step in the economic delivery of steam sizes, which are losing

out to oil and electricity on account of high producing costs, coupled with high freight rates and the river "arbitrary."

The leasing of 1,500 acres of coal land within a few miles radius of Elkville has been announced, John Fox being the promoter, acting for a large Eastern company, according to statements published. It is further stated that this company owns and operates 17 large mines in Virginia and that they will soon commence drilling operations on the land near Elkville. The vein at that point averages from 8 to 12 ft. thick and at a depth of about 300 ft.

The Illinois Central R.R. is contemplating the reconstruction of its coal chutes at the mine of the Jackson Coal Co. at Haildayboro, which were destroyed by fire some time back.

The two mines at Buckner and Weaver will again operate according to announcements by owners. The two plants have been idle for several months.

Final surveys and plans have about been completed at the proposed site of the new strip mine to be opened by the Equitable Coal & Coke Co., at Du Quoin. Engineers of the company have been working on the location for some time and it is expected that work will be started on the switch soon. Strip mining in this particular district has gained much popularity, this being the third operation to be opened within five years. The other two are the Harts horn Coal & Mining Co., at Elkville, and the Scott, Smith Coal Co., at Du Quoin.

INDIANA

Joseph T. Kingsley, district manager of the Binkley Coal Co., was appointed receiver for the Active Coal Co. by Superior Judge T. J. Moll, Indianapolis, recently. The proceedings were filed by the Union Fuel Co. on alleged failure to redeem a promissory note. Liabilities were listed at \$7,000. The company will not be sold until contracts now on the books are filed, it was said.

Gray Brothers, who are leasing coal land in Monroe and Lockhart townships, Pike County, the last week recorded fifty options on coal lands covering nearly 2,000 acres. Most of the land is optioned at \$100 to \$125 an acre. The Gray Brothers are rushing work on their railroad, being built from the Big Four R.R., just south of Oakland City. As soon as the road is completed three big strippers will be shipped into southern Monroe townships, where the Gray Brothers own one of the largest stripping coal fields in the Middle West.

A suit against the state, said to be the forerunner of a series of suits to recover more than \$150,000 in tonnage and license fees levied against Indiana coal operators by the State Coal and Food Commission during the 1920 fuel famine, was filed in the Indianapolis Superior Court recently by the Spring Valley Coal Co., of Greene County. The return of \$854 is sought. The commission was created by special act of the General Assembly, while James P. Goodrich was Governor, to expedite coal deliveries and regulate prices. It was composed of Mr. Goodrich, Jesse Eschbach, ex-chief examiner of the State Board of Accounts, and Otto L. Klauss, ex-Auditor of State. Expressing the opinion that the act was for "revenue producing purposes," the complaint avers the measure was in conflict with interstate commerce regulations and violated sections of the state and national constitutions. A hearing likely will be given in December before Judge Clinton H. Givan.

The property of the Domestic Coal Co., located a few miles southwest of Washington, on the Maysville road, was sold recently by the owners, Hugh L. Cox and Sheriff Hugh G. Faith, to William T. Enley and James Duese, both of Edwardsport, and Dr. Ernest Hollingsworth, of Washington. Title to a 238-acre farm east of Washington on the state highway No. 5, passed to Cox and Faith by the terms of the transaction. The land belonged to Enley. The Domestic Coal Co.'s mine has been in operation for three years. The new owners were given immediate possession.

At an approximate investment of \$25,000 the Bloomington Coal Co., Bloomington, has erected a new elevator, conveyor and

overhead pocket system for the handling of coal. The building is 105 ft. long, 24 ft. wide and 50 ft. high. A driveway in the center runs the entire length and is so arranged that loading wagons or trucks can drive in at one end and out at the other.

The Hoosier Coal Mining Co. has been incorporated at Dugger, with a capital of \$30,000 to carry on the business of mining. Roy E. Price, of Indianapolis, and Harry T. West, Irwin Coffey, Everett King, James Reeves and B. P. Tison, of Dugger, are the incorporators.

KANSAS

The Southwestern Interstate Coal Operators' Association and the United Mine Workers of District 14 after long negotiations, which apparently broke off in a disagreement, resumed conference and made a machine mining scale for the Pleasanton field, Linn County, which provides a 10c. differential from the pick scale. William Bogartz, district union president, on Sept. 24, a week after the agreement was made, gave a signed statement to Pittsburg newspapers that he was continuing to publish in the newspapers of that city, the center of the Kansas coal field, a warning to union miners to stay away from Pleasanton. He said only four Pleasanton companies have signed up and many miners living there are unable to get employment. No effort has been reported recently to resume negotiations for a machine scale for all of District 14 since the conference handling that matter adjourned many weeks ago without reaching an agreement.

Charging that fifteen years ago the Mackie Fuel Co. removed coal from under 3.49 acres of land belonging to the Western Coal & Mining Co. in the Cherokee County (Kansas) field, the latter company has brought suit for \$100,260.87 against the former directors of the now extinct firm in Federal District Court at Fort Scott. George K. Mackie, Flora Mackie, Eva Bush and Mrs. J. W. Mackie are named as former directors of the company and as statutory trustees for the stockholders since the dissolution of the corporation. In its petition the complainant says the alleged trespass was not discovered until recently, when men in its mine No. 21 cut through into the old workings of the Mackie mine. The total amount of coal removed is estimated at 11,242 tons, valued at \$14,400. The Western company is demanding \$43,200 for this coal, under the rule that treble value may be collected for coal removed by encroachment. To the \$43,200 is added \$38,000, accumulated interest. The remainder of the \$100,260.87 is demanded on the ground that the Mackie workings created a danger zone for Western mine No. 21, making it impossible for that concern to obtain men to work 16.39 acres of its holdings.

KENTUCKY

New methods of arriving at an equitable assessment of Kentucky coal properties went into effect July 1. Heretofore coal operators have lumped their assessments in many instances, but under the new system an itemized report will be made of all mining equipment and houses, tipples, buildings, etc., owned by the mining companies. This system is expected to bring to light much hitherto unlisted property and it will require the operators to pay the tax on separate items rather than in a lump valuation.

At least three mines near Madisonville, in Western Kentucky are still on strike following the failure, last summer, of the men to sign the two-year contract which the balance of the field made. About \$6,000 a week in strike benefits is now being paid to these strikers by the union.

David R. Ogden, of Louisville, formerly in the coal jobbing and operating business, has arranged to become local representative of the Crown Coal Co., Inc., selling agents for mines at Centertown and also the Rockport Coal Co., at Rockport, the Crown having mines on both the Louisville & Nashville and Illinois Central railroads.

The Bell Dean Coal Co., Louisville, has filed amended articles increasing its capital stock from \$11,000 to \$25,000, the amendment being filed on June 25.

Amended articles have been filed by the Delaware Coal Co., of Davies County, increasing its capital stock from \$60,000 to \$150,000.

The Drakesboro Coal Co., of Drakesboro, in western Kentucky, has been incorporated with a capital of \$40,000, by Claude Nichols, of Mogg, Edgar Nichols, of Central City, and A. J. Mercer, of Martwick.

The Falls City Coal Co., of Louisville, capital and liability limit each placed at \$10,000, has been chartered by Charles

Baumeister, Wilson H. Harcourt and John Herdt.

The E. T. Slider Co., handlers of river coal, sand and gravel, at Louisville and New Albany, have installed three new steel barges in their river service, and have three more coming, the equipment having been built at the Howard Shipyards plant, at Jeffersonville, Ind.

The United Mine Workers of District 23 have been denied an injunction to prevent the Dever Coal Co., of Webster County, from leasing its property to another concern, not a signer of last summer's two-year contact with the miners. Chief Justice Sampson in the Kentucky Court of Appeals said the court had no jurisdiction in such a matter.

The Louisville & Nashville R.R. reports that it has virtually completed work on additional yards at Strawberry, adjoining the South Louisville yards, which will give it capacity for several hundred additional cars at Louisville and improve facilities for switching and handling. Ten acres of land are taken up by the new yards, which cost over a quarter of a million dollars. A half million dollars also is to be expended in reducing grade and curves over Coal Hill, forty miles south of Louisville, on the main line to the western Kentucky coal fields, and to Nashville and the South.

The Inland Waterways Co., Louisville, has just purchased an additional steam towboat from the Ayer & Lord Tie Co., at Paducah, and has announced plans for maintaining regular schedules in handling tows of coal, oil and steel products between Louisville and upper river points, as far as Pittsburgh.

The Liggitt Mining Co., Cincinnati, with mines at Dakota, near Whitesburg, has resumed operations after being down for several months.

Operations have been started to put the New Castle mine of the New Castle Coal Co., at Edwardsville, which has been idle since last March, in condition to resume work soon. The pumps have been started.

The Eagle Coal Mining Co. has been incorporated in Oliver Springs, Minn., with a capital of \$25,000, by J. E. Wood, J. H. Hodges and W. A. Montgomery.

The Enterprise Coal & Mining Co., of Sullivan, has filed a preliminary certificate of dissolution.

MINNESOTA

Governor Preus, of Minnesota, has returned a pointed response to Governor Pinchot's letter urging an investigation of the possibilities of profiteering in the Minnesota coal trade. This was investigated a year ago by Colonel Ivan Bowen, of the State Railroad and Warehouse Commission. His conclusions are that with one or two minor exceptions, there was no profiteering in the Minnesota coal trade. So Governor Preus invites Governor Pinchot to the situation at home, suggesting that it is unfortunate that there should be permitted connivance in Pennsylvania by the operators, railroads and miners of anthracite whereby the price of anthracite is forced up. He declares that "certain classes of people" of Pennsylvania are now taking unfair advantage of the consumers of anthracite throughout the United States and Canada.

A new screening plant has been installed at Two Harbors. It will be used by the Duluth and Iron Range Ry. and will handle 150 tons an hour and cost \$90,000. It is electrically operated.

MISSOURI

In the U. S. District Court at St. Louis recently Judge Paris rendered a decision in favor of the Burton Coal Co., of Chicago, formerly known as the Wickham & Burton Coal Co., for \$19,330.80, against the Boehmer Coal Co., of St. Louis. The plaintiff sued for damages on a contract for 100 cars of coal made on April 19, 1920, and on which 22 cars were shipped. The defendant refused to ship any more, claiming car shortage. The plaintiff showed that the cars were delivered and the market price increased, and the Court sustained that view.

The Centerville Coal Co., of Centerville, Iowa, have taken over the property of the Mosby Coal Co., of Mosby, where, it is understood, the shaft enters a 32-ft. seam of coal, but it has not been worked successfully on account of quick sand.

NEW YORK

Raymond A. Walter and Walter M. Dake, former members of the staff of the U. S. Coal Commission, will establish an office as

consulting engineers in New York. As a representative of Chairman Hammond, Mr. Walter made investigations of mining communities while Dr. Dake was an assistant to C. E. Leshner in engineering studies made under direction of the Commission.

A fuel dictator, with full powers, was urged by the Flatbush Civic Association, members of which held their first full meeting at Public School 119, Avenue K and East Thirty-ninth Street, Brooklyn, Oct. 3. A resolution was passed asking Governor Smith to appoint a coal commission to regulate prices and distribution. Members declared the coal situation in Brooklyn was "disgraceful," and argued that it had been clearly shown fuel administrators heretofore have not had sufficient power to stop profiteering or regulate supplies.

Michael Tuohs, president of the Titan Fuel Corporation, New York City, has returned from a two months' tour of Europe.

F. B. Layton Coal Co., of Boston, will hereafter represent the Steamship Fuel Corporation, of New York, in New England.

OHIO

In order to finance extension plans the Muskingum Coal Co., of Zanesville, has increased its capital to \$300,000. The company has obtained a contract to furnish coal to the new \$10,000,000 power plant being erected at Philo, on the Muskingum River, which runs for about 10 years and which will eventually call for 50 cars daily. New mines will be opened and new leases have been obtained to increase its holdings.

The Gilt Edge Coal Co. has been chartered with an authorized capital of 600 shares, no par value, for the purpose of mining coal and for selling both coal and coke. Incorporators are John H. Smith, B. D. Smith, Charles A. McLaughlin, C. W. Arnold and Roy J. Stern.

Eleven mines of the Sunday Creek Coal Co., the George M. Jones Co., the Ohio Collieries Co. and the Caledonia Coal Co. have resumed operations near Corning after being practically shut down for the last three months. Fifteen hundred men are given employment.

Toledo's City Council has voted to make an investigation of the price of both anthracite and bituminous coal, the spread between wholesale and retail prices and whether there are any speculators in that city. The investigation, to be conducted by a committee of three, is to be concluded and findings reported not later than Dec. 1. The resolution recites that the report of the Hammond fact-finding commission found Toledo wholesalers were paying between \$12 and \$13 for a gross ton of anthracite, and that the retail price is between \$16 and \$17 a net ton. It also sets forth that the rail rates from the anthracite fields are lower to Toledo than to any other city in Ohio, although the retail price there is reported to be higher than in other cities.

The Maple Grove Coal Co., Columbus, will soon open a mine at Adena. Acreage has been obtained and it is proposed to open an electrically operated mine with an initial production of 400 tons daily. Walter Mulby, of Columbus, is at the head of the company, and E. C. Riley is general manager.

The Moore Fuel Co., of Columbus, is in the hands of a receiver. This caused the closing of their branch office which had been maintained for a few months in Cincinnati.

OKLAHOMA

The Wise-Buchanan Coal Co.'s mine immediately south of Henryetta was recently opened. This mine is one of the largest in the Henryetta district and affords employment for 100 miners. Its output is more than 800 tons a day. The mine has not been operated at capacity since it was opened, on account of lack of demand for coal. The company has held most of its miners, however, and expects to operate at capacity as soon as cold weather increases the demand for fuel.

PENNSYLVANIA

The anthracite tax cases reached the state Supreme Court at Pittsburgh on Sept. 26, when arguments were heard upon an appeal from the decision of the Dauphin County Court which had upheld the constitutionality of the Act of Assembly of May, 1921, fixing a tax upon anthracite. The Commonwealth of Pennsylvania is the plaintiff in the case with the Philadelphia & Reading Coal & Iron Co., Alliance Coal Mining Co., Cranberry Creek Coal Co. and the Lehigh Coal & Navigation Co. were

listed as defendants. Arguments of counsel centered upon the following points: Can a tax be assessed in accordance with the act of May, 1921, unless the tonnage and value is accurately ascertainable on the day it is prepared for shipment? Was it lawful to assess the tax after the coal had been delivered to the carrier? Was it lawful to assess the tax when the coal had no market value on the day the statute required the assessment to be made? Does the assessment of the tax violate the uniformity clause of the state Constitution and the commerce clause and the fourteenth amendment of the federal Constitution?

Approximately 750 miners employed at the Delaware Colliery of the Hudson Coal Company at Plains went out on strike Oct. 1 because a laborer refused to pay a fine of \$25 imposed upon him by the officials of the local to which he belonged for a violation of a union ruling. The offender had agreed to pay the fine at a recent meeting of the local, but upon paying the money at the colliery he demanded a receipt, which was refused him. The company then was asked to take a hand in the matter, and upon refusing to do so the men went out, throwing the colliery idle.

Announcement has been made by the National Mining Co. that it will build the largest coal tippie in the world at the Ginger Hill Mine near Monongahela.

The fourth annual banquet and dance of the Bertha-Consumers Co. of Pittsburgh, held Sept. 29 in the Fort Pitt Hotel, was attended by nearly two hundred persons representing the operating, sales and city office personnel. John H. Jones, president of the company, made a brief address, following the dinner, in which he discussed efficiency, operation and salesmanship.

Evans, Sprague & Sturges, Inc., Pittsburgh, having been refused registration by Deputy Barford of the State Securities Commission, after a personal conference, are not satisfied with the decision and are exercising their privilege of appealing to the Common Pleas Court of Dauphin County to reverse the decision of the deputy. D. J. Evans, of the firm, says the company "are not stock jobbers of the 'get-rich-quick' order, as might have been inferred by the news item given out by Mr. Barford. It is a firm of repute, and has had numerous requests from business firms to assist them in new financing, but according to the ruling handed down are not in a position to contemplate entering into negotiations with any of these firms until they are registered."

The George B. Newton Coal Co., of Philadelphia, has declared a semi-annual dividend of 3½ per cent on the first preferred stock, payable Nov. 1 to stock of record Oct. 15. This is the first dividend on the stock since 1915.

A state charter has been issued to the Sesler Coal Co., Uniontown, for mining coal and manufacturing coke; capital, \$30,000; treasurer, James T. Sesler, Uniontown. Incorporators: Philip Sesler, Uniontown; William H. Trader, Uniontown, and James Jeffrey, Oliphant Furnace.

The Kimberly Crest Coal Co., Somerset, has been incorporated, for mining and marketing coal and other minerals and its capital stock is \$50,000. Thomas Donohoe, Edgewood, is treasurer and the incorporators are the treasurer, T. M. Donohoe, Edgewood, and George W. Howell, Pittsburgh.

A charter has been issued to the Windber Standard Coal Co., Johnstown; mining, quarrying and producing fireclay; capital, \$151,500; treasurer, J. E. Graham, Johnstown. Incorporators: J. C. Congrove and H. J. Meehan, Johnstown, and John M. Miller, Indiana.

Governor Pinchot upon his return to Harrisburg from two weeks' seclusion at his Milford home announced that he intends to vigorously carry out his purpose to prevent gouging of anthracite coal consumers. The Governor emphasized that he is following the lines laid down at the conclusion of the anthracite settlement to regulate coal prices by supervision over freight rates and coordination of the state functions to check soaring prices. This was to be followed by concerted action of governors in anthracite-consuming states. He intimated that many of the governors addressed were sympathetic toward his proposition. Governor Pinchot called in Secretary Walsh of the Mines Department, Chairman Ainey of the Public Service Commission and Attorney General Woodruff as soon as he arrived. He said they presented to him results of their investigations as to the effects of the coal-strike settlement.

The George B. Newton Coal Co. pockets at 53d St. and Thomas Ave., Philadelphia, were badly damaged by fire recently.

Charles A. Johnson, president of the company, said that much of the hoisting machinery in the coal pockets, which cost \$125,000 to construct, probably would have to be replaced. Twenty thousand tons of coal in concrete bunkers was untouched by the flames.

In court in Somerset, Sept. 29, Michael Viscosky, Clement Acitelli, Michael Kulchek, John Lapata and Alfred Ramsell, all of Jerome, charged with having dynamited a bridge on the Jerome Branch of the E. & O. R.R., with the intent of preventing the shipment of coal from the mines of the Hillman Coal & Coke Co. mines to the main line of the railroad, were found guilty, after a trial lasting four days. William Gregory and Annuncio Pacifico, charged with complicity in the same affair, were discharged. John Goodisky, the other member of the gang alleged to have placed the charge of dynamite that threw the entire structure into the river, made a confession soon after his arrest and turned state's evidence. Judge Berkey has not indicated what action he will take with Goodisky. All the men charged with the dynamiting are miners who went on strike at Jerome in April of last year.

TEXAS

The State Board of Control has awarded contracts for the state's fuel supply for the next fiscal year, ending Sept. 30, 1924. The state will consume something like 25,000 tons of coal. Twelve months supply of lignite, which is used for fuel in many of the steam plants of the state, will be furnished by M. B. Shannon & Co., Dallas. Contracts for supplying most of the coal were awarded to the Southwestern Coal Co. of Dallas, and contracts for the rest of the coal supply were awarded to the Southern Coal Company, also of Dallas.

UTAH

The State Security Commission has permitted the Black Diamond Fuel Co., which has a government lease on 880 acres of coal land close to Clear Creek to sell 50,000 shares of its stock in Utah and 350,000 outside of Utah at par, \$1 a share, with the commission not to exceed 20 per cent and other costs not to exceed 5 per cent additional. The property, according to the engineers who investigated for the company, can be developed to a production of 500 tons a day at about 75 per cent of the average cost of such development. The commission throws special safeguards around the proposition in the way of escrowing the proceeds of the stock sales and retaining control until sufficient funds have been assembled to develop the mine properly. The coal is said to be a coking coal, low in sulphur content, and to rank in heat value with the very best of the Carbon County coals.

WEST VIRGINIA

Two new coal companies have been launched by H. P. Jones and others, one of them to be a coal agency and the other a mining concern. The first named known as the Harry P. Jones Sons Coal Co., was organized with a capital stock of \$50,000, with its main office to be at Huntington and the incorporators in addition to Mr. Jones were James R. Jones, W. U. Phillips, of Logans Ferry, Pa.; H. P. Jones, Jr., Ida M. Jones, of Huntington. The other concern is to be known as the Menniti Elkhorn Coal Co., also with headquarters at Huntington. Interested in this company are Samuel Menniti, George Vevacana, Samuel V. Suppa, Frank Alasci, of Charleston; H. P. Jones, of Huntington.

The Eccles and Sun mines in the New River field are now being operated by the Daniel B. Wentz interests, of Philadelphia, which acquired these mines late in July. Major W. P. Tams, one of the leading operators of the Winding Gulf region, also is interested. These mines were formerly owned and operated by the New River Collieries Co., controlled by the Guggenheim group.

One of the largest coal companies launched in northern West Virginia in some time is the Continental, capitalized at \$700,000. The incorporators are Howard W. Showalter, Samuel R. Hite, J. W. Mason, Brock Showalter and A. D. Showalter, all of Fairmont. Howard W. Showalter is president and A. D. Showalter is treasurer and purchasing agent. The company is purchasing about 1,000 acres of Sewickley coal near Cassville, in Monongalia County, and in the Scott's Run field. The company plans to install a large plant, including a modern tipples. Coal will be

mined through a shaft which is to be sunk to a depth of about 200 ft. and work on which, it is understood, will be started in the near future. It is planned to produce coal at the rate of between 3,000 and 4,000 tons a day.

The Elgasco Fuel Co. has just been organized by Bluefield capitalists to operate in the Pocahontas region, being capitalized at \$50,000. Bluefield is to be the general headquarters of the company, in which the following people are interested: E. S. Crockett, H. W. Crockett, R. F. Smith and Thomas H. Scott, all of Bluefield, and R. A. Crockett, of Graham.

The New England Fuel & Transportation Co. is doing work preliminary to the installation of a new plant near Arnettville in the Monongalia County field, to be known as No. 4. Excavating is now being done by a force of about 20 men in preparation for the sinking of a shaft. In the Arnettville section, the company has about 3,000 acres of low-sulphur Pittsburgh coal available for development.

At the invitation of E. E. White, president of the Winding Gulf Coal Operators' Association, the delegates attending the National Tax Association at White Sulphur Springs, made a tour of the Winding Gulf district. A special train on the Chesapeake & Ohio railroad was provided.

Chief R. M. Lambie of the Department of Mines was in Wheeling and Benwood recently inquiring into the recent mine explosion at the Benwood mine of the Wheeling Steel Corporation, which resulted in the death of three men. Holding of an inquest was deferred until the head of the Department of Mines could be present.

During August eleven companies were organized to engage in the coal business. The aggregate capitalization of new resident and non-resident coal companies formed was \$2,620,000. In the list of resident corporations organized were: Shenandoah Coal Co., Logan, \$75,000; Coolidge Coal Co., Fairmont, \$50,000; Jennings Coal Co., Monongah, \$25,000; Tildesley Collieries Co., Charleston, \$100,000; Prestonia Coal & Lumber Co., Sutton, \$200,000; Old Furnace Coal & Iron Co., Kingwood, \$1,000,000; Hayzelett Coal Co., Mullens, \$10,000; Mudd Creek Coal Co., Kingwood, \$200,000; Batelle Colliery Co., Charleston, \$200,000; Unity Coal Co., Wheeling, \$10,000; Roaring Creek Coal Co., Elkins, \$50,000. New non-resident coal corporations organized were: Charleston Coal Corporation, with chief works in Tennessee, \$50,000; Index Mines Corporation, of Parkersburg, with chief works in Colorado, \$100,000; The Crane Fuel Co., of Cincinnati, \$200,000; Peerless Coal Mining Co., of Baltimore, Md., \$250,000; Randazzo Elkhorn Coal Co., of Huntington, W. Va., \$100,000. The Lambert Run Coal Co. has increased its capital stock from \$25,000 to \$500,000. C. D. Robinson and others are interested in this company, which operates in northern West Virginia. The Cardiff Pocahontas Coal Co. has increased its capital stock from \$75,000 to \$100,000, and the Robinson & Hardesty Coal Co. has increased its capital stock from \$25,000 to \$50,000.

WISCONSIN

Milwaukee or any other city in the state has the power to distribute coal in the event that dealers charge exorbitant prices, says a ruling of the Wisconsin Department of Markets. A margin of 20 per cent profit is held as a fair compensation to coal dealers. The department quotes the law, which says "any city may by a vote of three-fourths of all the members of the council establish and operate equipment for the purchase, sale and supply of fuel to its citizens, under regulation of the council."

WASHINGTON, D. C.

The publicity committee of the National Coal Association for the coming year is as follows: G. H. Barker, vice-president, Maynard Coal Co., Hayden-Clinton Bldg., Columbus, O.; C. E. Bockus (chairman), president, Clinchfield Coal Corp., New York; A. W. Calloway, president, Davis Coal & Coke Co., Philadelphia; W. H. Cunningham, president, Cunningham, Miller & Einslow, Huntington, W. Va.; C. C. Dickson, president, Dry Branch Coal Co., Charleston, W. Va.; G. M. Gillette, manager, Consolidation Coal Co., Frostburg, Md.; T. W. Guthrie, president, Hillman Coal & Coke Co., Pittsburgh, Pa.; M. B. Lanier, president, Empire Coal Co., Birmingham, Ala.; F. S. Love, general manager, Union Collieries Co., E. W. Lukins, president, Farmers' Fuel Co., Kansas City, Mo.; W. E. Maltby, manager, Washington Coal Producers' Association, Seattle, Wash.; P. H. Penna, secre-

tary, Indiana Bituminous Coal Operators' Association, Terre Haute; R. M. Randall, general manager, Consolidated Coal Co., of Saginaw, Saginaw, Mich.; S. H. Robbins, president, Youghiogheny & Ohio Coal Co., Cleveland; Edward Soppitt, president, Erie Coal Mining Co., Butler, Pa.; C. W. Taylor, vice-president, W. G. Duncan Coal Co., Greenville, Ky.; C. M. Watt, general manager, Loyal Hanna Coal & Coke Co., Philadelphia; E. E. White, president, E. E. White Coal Co., Glen White, W. Va.

CANADA

The Dominion Government is urged to extend the scope of the Royal Commission which has been appointed to investigate working and living conditions which resulted in the steel workers' strike of July last, to include an inquiry into the difficulties which have confronted the coal miners in their dealings with the British Empire Steel Corporation in a resolution drawn up at the regular meeting of the Town Council of Glace Bay, copies of which have been sent to the Prime Minister and the Minister of Labor.

The Grand Lake Coal & Railway Co. has been engaged in moving equipment and miners' cottages from the South Minto soft-coal mines to the newly developed areas at North Minto, a distance of three miles. The South Minto mines will be continued in operation, on a smaller scale.

The Canadian National Railways will construct an extension to their branch line, connecting the Grand Lake soft-coal fields with the main line of the transcontinental system. The line will be built from Chipman to Minto, a distance of seventeen miles. It is expected that a number of independent mines will be opened in consequence of this extension.

J. B. McLashlan and Dan Livingstone, former U.M.W. officials for the eastern Canada district, who were deposed by President Lewis, have been denied a change of venue in their trial for seditious libel.

The Alberta Carbon Coal Co., Ltd., has been formed for the exploitation of 2,640 acres of coal lands in the Carbon District, twenty miles west of Drumheller. The seam to be developed is reported to be 5 ft. thick and to be capable of producing some 10,000,000 tons of coal. The company is capitalized with a share capital of \$500,000 and \$100,000 first mortgage 8 per cent gold bonds. H. Ransford is the president and W. P. Hinton, former general manager of the G. T. P., is a director.

The Dominion Fuel Board, which has been conducting an inquiry into the feasibility of establishing byproduct recovery coke ovens in some of the large cities, has nearly finished its work. Charles Stewart states that the survey has shown the demand to warrant the establishment of plants at several points in eastern Canada. Financial circles in Montreal and Toronto are awaiting with keen interest the final report of the Fuel Board. In conjunction with the Mines branch the board is investigating the coking qualities of the Nova Scotia and New Brunswick coals and arranging for commercial tests on a large scale in addition to the laboratory investigation.

Output of coal from Canadian mines during June amounted to 1,304,000 net tons, an increase of 4 per cent over the previous month, according to the Dominion Bureau of Statistics. This was 29 per cent over the average for the corresponding month of the three preceding years. The output for the month showed increases of 63,000 tons in Nova Scotia, 53,000 tons in British Columbia and 3,000 tons in New Brunswick. In Alberta there was a decrease of 69,000 tons. For the first half of 1923 the cumulative output from all mines amounted to 8,722,000 tons, an increase of 25 per cent over the preceding three-year average for the same period. Importation of coal during June was 2,562,000 tons, as compared with 1,684,000 tons in May. Of this tonnage 79,400 tons came from Great Britain. Anthracite imported during the month totaled 505,900 tons, 17 per cent greater than in May and 47 per cent higher than the three-year average for the month. The United States furnished 479,200 tons of this amount, 26,700 tons coming from Great Britain. Exports during June were 101,400 tons, as compared with 99,100 tons in May, a decrease of 43 per cent when compared with the June exports of the preceding three-year average. The tonnage available for consumption in Canada during the month was 3,765,400 tons, or 33 per cent more than in the preceding month. Men employed in the coal mines during June totaled 27,669, of whom 20,615 worked underground and 7,054 were surface men. The production per man was 47 tons for June as against 45 tons per man in May.

Obituary

Kuper Hood, vice-president and manager of sales for the Houston Coal Co., of Cincinnati, died Sept. 28 of a throat affection. Mr. Hood, who was born in Stanton, Va., on Nov. 23, 1874, had been sales manager first for the Big Hill Coal Co. and later was associated with the Kentucky Fuel Co. at Atlanta, Ga. In 1910 he joined the sales force of the Houston Coal Co. as assistant general sales manager, succeeding to the

KUPER HOOD

direction of that department in 1912. In May, 1923, he was elected vice president of the company in charge of sales. He also was a member of the foreign trade committee of the National Coal Association.

Benjamin Crosby Davidson, former Mayor of Uniontown, Ky., owner of the Davidson Mines and later general manager of the Uniontown Coal Co., until it was sold, died at his home in that city on Sept. 18. He is survived by his wife, two children, a brother and two sisters.

C. D. Robertson, for the past six years fuel inspector for the Seaboard Air Line Ry., died at his residence at Birmingham, Sept. 20, after a short illness. Mr. Robertson was 53 years of age.

Trade Literature

The Timken Roller Bearing Co. of Canton, Ohio, has issued an attractive 6x8-in. booklet entitled **Better Mine Cars with Timken Tapered Roller Bearings**, containing 32 pages. The booklet contains seven chapters and numerous illustrations showing Timken equipment at coal mines.

The Ohio Brass Co., Mansfield, Ohio, has published its 1924-1925 No. 19 catalog, covering high-tension insulators, trolley-line materials, rail bonds and tools and car-equipment specialties. The book has 770 pages, 6x9 in. It is well illustrated and indexed for ready reference.

The Industrial Works, Bay City, Mich., has issued a golden anniversary catalog commemorating 50 years' service. It describes cranes for all purposes; their use in coal handling and storage is covered, together with power wheel buckets, dragline buckets, etc. Book 115. Pp. 161; 8x11 in.; illustrated.

Single-Line Buckets, Blaw-Knox Co., Pittsburgh, Pa. Bulletin 812. Pp. 18, 8x11 in.; illustrated. This bucket uses the same hoisting line for closing and for supporting it during opening, and can be hooked on or direct reeved to hoist. Single-rope cableway requiring only one hoisting drum is described.

Electric Industrial Trucks and Tractors, Crescent Truck Co., Lebanon, Pa. Pp. 47; 8x11 in.; illustrated. Among the trucks described are the side-dump and end-dump types. Specifications of the different trucks and trailers are given.

"**Large Polyphase Induction Motors**" are covered in Bulletin No. 1087, just published by the Allis-Chalmers Manufacturing Co. The more general application of large hoists, fans and compressors around the coal mines

is greatly increasing. This bulletin covers many points of design and operating characteristics of large induction motors.

Association Activities

A coal shortage in Texas and throughout the Southwest was predicted by C. R. Goldman, secretary of the **Texas Retail Coal Dealers' Association**, before a conference of coal operators, wholesale and retail coal dealers and railway officials held in Dallas recently. Mr. Goldman declared that many miners formerly employed in the mines of the Southwest had gone to other parts of the country on account of the lack of work during the summer. Individuals and many factories, apparently lulled into inactivity by the memories of mild winters for the last two years, have failed to consider the question of fuel for a possibly severe winter. Mr. Goldman said, and the result is that practically no coal has been stored by home owners and factories against the winter needs. Railroad men of the Southwest who attended the conference pointed out the gravity of the situation that will result when cold weather comes and the public rushes in to buy coal.

The **Baltimore Coal Exchange** held its annual meeting Sept. 25, and elected Hugh C. Hill, president; Benson Blake, Jr., vice-president; L. C. Wilcox, second vice-president; J. E. Waesche, treasurer, and Julius Hellweg, secretary.

After Oct. 1 the offices of the **National Retail Coal Merchants' Association** will be located in the Transportation Building, Rooms 705 to 710, inclusive, Washington, D. C.

Publications Received

Internal Combustion Engines, by Robert L. Streeter. Second edition. Pp. 443; 6x9 in.; illustrated. Price, \$4. A thorough revision of this standard textbook on the fundamental principles of the theory and design of gas and oil engines. The book is especially adapted for class and drafting-room instruction; it includes a collection of useful problems. McGraw-Hill Book Co., Inc., 370 Seventh Avenue, New York City.

Principles of Direct-Current Machines, by Alexander S. Langsdorf. Third edition. Pp. 455; 5x8 in.; illustrated. Price, \$4. A reasonably complete treatment of the fundamental principles that underlie design and operation. It concentrates attention upon certain important features that ordinarily are dismissed with a little more than passing mention. Among these are the material on armature windings, operating characteristics of generators and motors, and commutation. McGraw-Hill Book Co., Inc., 370 Seventh Ave., New York City.

The Work of the Pennsylvania Survey, 1919-1922, by George H. Ashley, State Geologist, Harrisburg, Pa. Pp. 18; 8x10 1/2 in. Describes the organization, administration, information service, publications and surveys. Charts showing progress in topographic and geologic mapping are included.

Traffic News

John Morris, regional director of the American Railway Association and the Cincinnati Terminals, has called a meeting in Cincinnati of the prominent shippers of the coal and other commodities to go over the situation as it appertains to the empty-car requirements and the movement of the heavier classes of freights. Coal men of prominence from all the fields within the territory under the jurisdiction of Mr. Morris have been invited to attend the meeting and to offer their suggestions as the best means of keeping the freights moving.

The I. C. C. has directed the anthracite carrying railroads to file a brief before Oct. 22 showing why railroad rates on anthracite should not be reduced, as asked by the U. S. Coal Commission. A committee of general solicitors of this group of carriers, of which H. A. Taylor of the Erie is chairman, is now preparing this brief. The call for the brief was made by the Interstate Commerce Commission following the hearing held in Pittsburgh before Attorney Examiner William A. Disque on Sept. 24-25. Mr. Disque, after studying the brief of the railroads against a rate reduction, will make a report to the full commission, which

will be studied by the latter, together with the actual brief of the carriers. The commission will then hand down its decision. In addition to the general brief being prepared by the committee, separate briefs may be filed by any other road which chooses to do so. The Erie has definitely decided to file no separate brief. Separate testimony has been prepared and submitted to Examiner Disque by the Delaware & Hudson and the Boston & Maine. The original plan to send out a questionnaire to the different hard-coal carriers has been canceled.

The Interstate Commerce Commission hearing in the case of the **United Collieries, Inc., vs. the Southern Ry.**, which was assigned for Oct. 11 at Big Stone Gap, Va., before Examiner McGrath, has been postponed indefinitely. The commission also has cancelled the hearing in the case of the **Pioneer Coal and Coke Co. vs. Pennsylvania Railroad**, which was assigned for Oct. 23 at St. Louis, Mo.

Oral argument will be heard Nov. 8 by the full Interstate Commerce Commission in the following important cases: Cancellation of rates on coal from Kentucky, Tennessee and Virginia to Minnesota points via the Chicago, Rock Island & Pacific Ry.; Cedar Rapids vs. Chicago, Rock Island & Pacific Ry.; United Light & Railways Co. vs. Chicago, Rock Island & Pacific Ry.; coal from Kentucky, Tennessee and Virginia points to Northern and Northwestern destinations. On Nov. 15 the commission will hear arguments in the case of the Northwestern Coal Dock Operators' Association vs. the Chicago & Alton R.R., and in the case of the Illinois Coal Traffic Bureau vs. the Chicago & Northwestern Ry. On Nov. 19, Division 3 of the commission will hear the case of the Colorado & Utah Coal Co. vs. the Denver & Salt Lake R.R. On the day following, Division 4 will listen to oral arguments in the case of the Lincoln Gas Coal Co. versus the Baltimore & Ohio R.R.

The car service division of the American Railway Association announces that the railroads on Sept. 15 had **165,284 freight cars in need of repair**, or 7.3 per cent. of the total number on line. This was a decrease of 10,043 compared with Sept. 1, at which time there were 175,327, or 7.7 per cent.

The railroads on Sept. 15 had **10,792 locomotives in need of repair**, or 16.8 per cent of the total number on line, according to reports filed with the car service division of the American Railway Association. This was an increase of 275 over the number on Sept. 1, at which time there were 10,517, or 16.3 per cent. The railroads on Sept. 15 had 2,914 serviceable locomotives in storage, where they are to remain until traffic conditions warrant their use.

That **Henry Ford has purchased \$1,807,000 worth of coal cars** is revealed in his objection filed against the Interstate Commerce Commission's assigned-car decision.

An application for permission to build six miles of new line from Oakland City, Ind., into Pike County has been filed with the Interstate Commerce Commission by the Evansville, Indianapolis & Terre Haute Ry. The petition says the line would serve a large area underlaid with high-grade coal which could be mined cheaply by stripping off surface soil with steam shovels. The Commission had previously in the case of the Virginian Ry. of West Virginia refused to allow such an extension on the ground that there already are enough coal mines in the United States. The latter case is up for a reconsideration on the petition of the railroad company.

Coming Meetings

American Gas Association, annual meeting Oct. 15-19, Atlantic City, N. J. Secretary-Manager, Oscar H. Fogg, 342 Madison Ave., New York City.

The West Virginia-Kentucky Association of Mine, Mechanical and Electrical Engineers will hold its annual meeting Oct. 19-20 at Huntington, W. Va. Secretary-treasurer, Herbert Smith, Robson-Prichard Bldg., Huntington, W. Va.

American Welding Society, Oct. 24-26, Pittsburgh, Pa. Secretary, M. M. Kelly, 33 West 39th St., New York City.

Harlan County Coal Operators' Association, Nov. 21, Harlan, Ky. Secretary, E. R. Clayton, Harlan, Ky.

Coal Mining Institute of America will hold its annual meeting Dec. 19, 20 and 21 at Pittsburgh, Pa. Secretary, H. D. Mason, Jr., Chamber of Commerce Building, Pittsburgh, Pa.

COAL AGE

The Only National Paper Devoted to Coal Mining and Coal Marketing

C. E. LESHER, *Editor*

Volume 24

NEW YORK, OCTOBER 18, 1923

Number 15

Is Betelgeuse Drawing Nigh?

THE old maxim about the strength of union has never yet impressed coal operators. Apparently it has been all right for labor to unite and strengthen to a point of dictatorship in the industry, but unity of policy and opinion among mine owners has long appeared as distant at Betelgeuse. Its greatest distance may have been attained in Illinois, especially in 1910, when the old single operators' association of that state was shattered by the withdrawal of Southwestern operators who were tired of holding out against striking miners, and made peace—and an association of their own. But today that distance appears to have been reduced to some extent.

There has been no consolidation of the three existing operators' associations in Illinois, but a single policy committee for the three has been set up and endowed with some authority. It will speak for the state. It will deal as one body with the union both outside of Illinois and within. That is, it will perform these important functions unless something happens to cut the sod from beneath its feet. There is no point in claiming that every operator in the state firmly believes this new committee plan is 100 per cent right. Of course there is some skepticism regarding the service the committee can perform, and the plan could be upset in an emergency. But the hopeful thing about it is that a definite step has been taken in Illinois toward consolidation.

Operators in that state should convince themselves of the importance of the step they have now taken. They should review at a glance the costly history of disunion which the coal operators of the whole country have written. They have already reviewed, in certain measure, that cost in their own state and resolved, after a fashion, to avoid repetition. It remains to be seen whether they will cling to that sound policy when a situation arises—as it surely will—calling once more for the well-known but little-used "solid front."

Electrification

SINCE the early nineties we have introduced electric haulage equipment into the coal mines of this country. The electrification of mining machines, pumps and fans came later, and still later hoists and screening equipment operated electrically. Electricity has stolen in on us like a thief in the night, and consequently we have been slow to put it, as it should be put, into the hands of specialists.

Today we are just beginning to organize for effective operation of mines by electricity. We have at last electrical engineers in charge of equipment supported by staffs of varying adequacy. But most electrical engineers still are compelled to put expensive and complicated machinery in the hands of men of little training and even of restricted ability, education and

opportunity. Furthermore, the electrical engineer at the mines is not supported adequately by any national society. He needs the help of an electrical organization if he is to obtain the benefit of the experience of others. Rapid progress in any art is attained only by the co-ordinated effort of individuals.
